Of the other Greek towns in Asia scarcely any were founded by Alexander himself, though the plan adopted by his successors of securing their dominions by building Greek cities may perhaps be due to him (cf. Polyb. x. 27). Most of these new cities were based on older settlements; but the essential point is, that they were peopled by Greek and Macedonian colonists, and enjoyed civic independence with laws, officials, councils and assemblies of their own, in other words, an autonomous communal constitution, under the suzerainty of the empire. A portion, moreover, of the surrounding land was assigned to them. Thus a great number of the country districts—the ἔθνη above mentioned—were transformed into municipal corporations, and thereby withdrawn from the immediate government of the king and his officials (satraps or *strategi*), though still subject to their control, except in the cases where they received unconditional freedom and so ranked as "confederates." The native population of these villages and rural districts, at first, had no civic rights, but were governed by the foreign settlers. Soon, however, the two elements began to coalesce; in the Seleucid Empire, the process seems generally to have been both rapid and complete. Thus the cities became the main factors in the diffusion of Hellenism, the Greek language and the Greek civilization over all Asia as far as the Indus. At the same time they were the centres of commerce and industrial life: and this, in conjunction with the royal favour, and the privileges accorded them, continually drew new settlers (especially Jews), and many of them developed into great and flourishing towns (see further under HELLENISM).

Shortly after his conquest of Babylonia, Seleucus had founded a new capital, Seleucia (*q.v.*), on the Tigris: his intention being at once to displace the ancient Babylon from its former central position, and to replace it by a Greek city. This was followed by a series of other foundations in Mesopotamia, Babylonia and Susiana (Elam). "Media," says Polybius (x. 27), "was encircled by a sequence of Greek towns, designed as a barrier against the barbarians." Among those mentioned are: Rhagae (Rai), which Seleucus metamorphosed into a Hellenic city, Europus, Laodicea, Apamea and Heraclea (Strabo xi. 525: Plin. vi. 43: cf. MEDIA). To these must be added Achaea in Parthia, and, farther to the east, Alexandria Arion in Aria, the modern Herat: also Antiochia Margiana (Strabo xi. 514, 516; Plin. 46, 93), now Merv, and many others. Further, Alexandria in Aradrosia, near Kandahar, and the towns founded by Alexander on the Hindu-Kush and in Sogdiana.

Comisene, the districts on the verge of the desert; (10) Hyrcania; (11) Astabene, with the royal town Asaac on the Attruck (see PARTHIA); (12) Parthyene with Parthaunisa, where the sepulchres of the kings were laid; (13) Apavarcticene (now Abiward, with the capital Kelat); (14) Margiane (Merv); (15) Aria (Herat); (16) Anauon, the southern portion of Aria; (17) Zarangiane, the country of the Drangians, on the lake of Hamun; (18) Arachosia, on the Etymander (Helmand), called by the Parthians "White India," extending as far as Alexandropolis (Kandahar), the frontier city of the Parthian Empire.

On the lower Etymander, the Sacae had established themselves—obviously on the inroad of the Scythian tribes—and after them the country was named Sacastene (now Sejistan, Seistan). Through it lay the route to Kandahar; and for this reason the district is described by Isidore, though it formed no part of the Parthian Empire.

Vassal States.

Round these provinces lay a ring of numerous minor states, which as a rule were dependent on the Arsacids. They might, however, partially transfer their allegiance on the rise of a new power (*e.g.* Tigranes in Armenia) or a Roman invasion. Thus it is not without justice that the Arsacid period is described, in the later Persian and Arabian tradition, as the period of "the kings of the part-kingdoms"—among which the Ashkanians (*i.e.* the Arsacids, from *Ashak*, the later pronunciation of the name *Arshak* = Arsaces) had won the first place. This tradition, however, is nebulous in the extreme; the whole list of kings, which it gives, is totally unhistorical; only the names of one Balash (=Vologaeses) and of the last Ardewan (=Artabanus) having been preserved. The period, from the death of Alexander to the Sassanid Ardashir I., is put by the Persian tradition at 266 years; which was afterwards corrected, after Syro-Grecian evidence, to 523 years. The actual number is 548 years (*i.e.* 323 B.C. to A.D. 226). The statements of the Armenian historians as to this period are also absolutely worthless.

The ten most important of the vassal states were:—

1. The kingdom of Osroene (*q.v.*) in the north-east of Mesopotamia, with Edessa as capital, founded about 130 B.C. by the chieftain of an Arabian tribe, the Orrhoei, which established itself there.

2. To this must be added the numerous Arabian tribes of the Mesopotamian desert, under their chiefs, among whom one Alchaudonius comes into prominence in the period of Tigranes and Crassus. Their settlement in Mesopotamia was encouraged by Tigranes, according to Plutarch (*Luc.* 21) and Pliny (vi. 142). In later times the Arabic town Atra in an oasis on the west of the Tigris, governed by its own kings, gained special importance.

3 and 4. To the east of the Tigris lay two kingdoms: Gordyene (or Cordyene), the country of the Carduchians (now Bohtan), a wild, mountainous district south of Armenia; and Adiabene (Hadyab), the ancient Assyria, on either side of the Zab (Lycus).

5. On the farther side of Zagros, adjoining Adiabene on the east, was the kingdom of Atropatene in north Media, now often simply called Media (*q.v.*).

While the power of Armenia was at its height under Tigranes (86–69 B.C.) all these states owned his rule. After the victories of Pompey, however, the Romans claimed the suzerainty, so that, during the next decades and the expeditions of Crassus and Antony, they oscillated between Rome and Parthia, though their inclination was generally to the latter. For they were all Orientals and, consciously or unconsciously, representatives of a reaction against that Hellenism which had become the heritage of Rome. At the same time the loose organization of the Parthian Empire afforded them a greater measure of independence than they could hope to enjoy under Roman suzerainty.

6. In the south of Babylonia, in the district of Mesene (the modern *Maisan*), after the fall of Antiochus Sidetes (129 B.C.), an Arabian prince, Hyspaosines or Spasines (in a cuneiform inscription of 127, on a clay tablet dated after this year, he is called Aspasine) founded a kingdom which existed till the rise of the Sassanian Empire. Its capital was a city (mod. Mohammerah), first founded by Alexander on an artificial hill by the junction of the Eulaeus (Karun) with the Tigris, and peopled by his veterans. The town, which was originally named Alexandria and then rebuilt by Antiochus I. as Antiochia, was now refortified with dikes by Spasines, and christened Spasinu Charax ("the wall of Spasines"), or simply Charax (Plin. vi. 138 seq.). In the following centuries it was the main mercantile centre on the Tigris estuary.

The kingdom of Mesene, also called Characene, is known to us from occasional references in various authors, especially Lucian (*Macrobii*, 16), as well as from numerous coins, dated by the Seleucian era, which allow us to frame a fairly complete list of the kings.[1] The Arabian dynasty speedily assimilated itself to the native population; and most of the kings bear Babylonian—in a few cases, Parthian—names. The official language was Greek, till, on the destruction of Seleucia (A.D. 164), it was replaced on the coinage by Aramaic. Another Babylonian dynast must have been Hadadnadinaches (*c.* 100 B.C.), who built in Tello the fortified palace which has been excavated by de Sarzec.

7. East of the Tigris lay the kingdom of Elymais (Elam), to which belonged Susa and its modern representative Ahwaz, farther down on the Eulaeus. The Elymaeans, who had already offered a repeated resistance to the Seleucids, were subdued by Mithradates I., as we have mentioned above; but they remained a separate state, which often rebelled against the Arsacids (Strabo xvi. 744; cf. Plut. *Pomp.* 36; Tac. *Ann.* vi. 50). Of the kings who apparently belonged to a Parthian dynasty, several bearing the name Cammascires are known to us from coins dated 81 and 71 B.C. One of these is designated by Lucian (*Macrobii*, 16) "king of the Parthians"; while the coinage of another, Orodes, displays Aramaic script (Allotto de la Fuye, *Rev. num.*, 4me série, t. vi. p. 92 sqq., 1902). The kingdom, which is seldom mentioned, survived till Ardashir I. In its neighbourhood Strabo mentions "the minor dynasties of the Sagapenians and Silacenians" (xvi. 745). The Uxians, moreover, with the Cossaeans and other mountain tribes, maintained their independence exactly as under the later Achaemenids (Strabo xvi. 744; Plin. vi. 133).

8. The district of Persis, also, became independent soon after the time of Antiochus IV., and was ruled by its own kings, who perpetuated the Achaemenian traditions, and on their coins—which bear the Persian language in Aramaic characters, *i.e.* the so-called Pahlavi—appear as zealous adherents of Zoroastrianism and the Fire-cult (see PERSIS). They were forced, however, to acknowledge the suzerainty of Parthia, to which they stood in the same position as the Persians of Cyrus and his forefathers to the Median Empire (cf. Strabo xv. 728, 733, 736; Lucian, *Macrob.* 15). In later times, before the foundation of the Sassanid dominion, Persis was disintegrated into numerous small local states. Even in Carmania we find independent kings, one of whom gave his name to a town Vologesocerta (*Balashkert*).

9. The east of Iran—Bactria with Sogdiana, Eastern Arachosia and Gedrosia—was never subject to the Arsacids. Here the Graeco-Bactrian and Graeco-Indian kingdoms held their own, till, in 139 B.C., they succumbed before the invading Mongolian and Scythian tribes (see BACTRIA and works quoted there). But in the Indus district the Greek kings held their ground for an appreciably longer period and, for a while, widely extended their power (see MENANDER OF INDIA). Among the kings then following, only known to us from their coins, there appears a dynasty with Iranian and sometimes peculiarly Parthian names which seems to have reigned in the Punjab and Arachosia. Its best-known representative, Gondophares or Hyndopherres, to whom legend makes the apostle Thomas write, reigned over Arachosia and the Indus district about A.D. 20. Further, about A.D. 70, the *Periplus* of the Erythraean Sea mentions that the great commercial town of Minnagar in the Indus Delta was under Parthian kings, "who spent their time in expelling one another." Here, then, it would seem there existed a Parthian dynasty, which probably went back to the conquests of Mithradates I. (cf. Vincent A. Smith, "The Indo-Parthian Dynasties from about 120 B.C. to A.D. 100," in the *Zeitschr. der deutschen morgenl. Gesellsch.* 60, 1906). Naturally, such a dynasty would not long have recognized the suzerainty of the Arsacids. It succumbed to the Indo-Scythian Empire of the Kushana, who had obtained the sovereignty of Bactria as early as about A.D. 50, and thence pressed onward into India. In the period of the *Periplus* (*c.* A.D. 70) the Scythians were already settled in the Indus valley (pp. 38, 41, 48), their dominion reaching its zenith under Kanishka (*c.* A.D. 123–153).

This empire of the Kushana merits special mention here, on account of its peculiar religious attitude, which we may gather from the coins of its kings, particularly those of Kanishka and his successor Huvishka, on which an alphabet adapted from the Greek is employed (cf. Aurel Stein, "Zoroastrian Deities on Indo-Scythian Coins," in *The Babylonian and Oriental Record*, vol. i., 1887). Kanishka, as is well known, had embraced Buddhism, and many of his coins bear the image and name of Buddha. Iranian divinities, however, predominate on his currency: Mithras (*Mihro* or *Helios*); the Moon *Mah* (also Selene); *Athro*, the Fire; *Orthragno* (Verethragna); *Pharro* = Farna (hvarena), "the majesty of kingship"; Teiro = Tir (Tistrya "the archer"); *Nana* (Nanaia); and others. Here, then, we have a perfect example of syncretism; as in the Mithras cult in Armenia, Asia Minor, and still further in the Roman Empire. Buddhism and Zoroastrianism have been wedded in the state religion, and, in characteristic Indian fashion, are on the best of terms with one another, precisely as, in the Chinese Empire at the present day, we find the most varied religions, side by side, and on an equal footing.

10. Originally a part of the Turanian steppe belonged to the Arsacids; it was the starting-point of their power. Soon, however, the nomads (Dahae) gained their independence, and, as we have seen, repeatedly attacked and devastated the Parthian Empire in conjunction with the Tocharians and other tribes of Sacae and Scythians. In the subsequent period, again, we shall frequently meet them.

It may appear surprising that the Arsacids made no attempt to incorporate the minor states in the empire and

[1] See Saint-Martin, *Recherches sur la Mésène et la Characène* (1838); Reinaud, *Mémoires sur le royaume de la Mésène* (1861); E. Babelon, "Numism. et chronol. des dynastes de la Characène," in *Journ. internat. d'archéol. numism.* vol. i. (1898).

create a great and united dominion, such as existed under the Achaemenids and was afterwards restored by the Sassanids. This fact is the clearest symptom of the inner weakness of their empire and of the small power wielded by the "king of kings." In contrast alike with its predecessors and its successors, the Arsacid dominion was peculiarly a chance formation—a state which had come into existence through fortuitous external circumstances, and had no firm foundation within itself, or any intrinsic *raison d'être*.

Character of the Parthian Empire.

Three elements, of widely different kinds, contributed to its origin and defined its character. It was sprung from a predatory nomad tribe (the Parnian Dahae, Scythians) which had established itself in Khorasan (Parthia), on the borders of civilization, and thence gradually annexed further districts as the political situation or the weakness of its neighbours allowed. Consequently, these nomads were the main pillar of the empire, and from them were obviously derived the great magnates, with their huge estates and hosts of serfs, who composed the imperial council, led the armies, governed the provinces and made and unmade the kings (Strabo xi. 515; Justin xli. 2; the former terming them συγγενεῖς, "kinsmen" of the king, the latter, *probuli*). Of these great families that of Surenas held the privilege of setting the diadem on the head of the new king (Plut. *Crass.* 21; Tac. *Ann.* vi. 42).

The military organization, moreover, was wholly nomadic in character. The nucleus of the army was formed of armoured horsemen, excellently practised for long-distance fighting with bow and javelin, but totally unable to venture on a hand-to-hand conflict, their tactics being rather to swarm round the enemy's squadrons and overwhelm them under a hail of missiles. When attacked they broke up, as it seemed, in hasty and complete flight, and having thus led the hostile army to break its formation, they themselves rapidly reformed and renewed the assault. How difficult it was for infantry to hold their own against these mounted squadrons was demonstrated by the Roman campaigns, especially in broad plains like those of Mesopotamia. In winter, however, the Parthians were powerless to wage war, as the moisture of the atmosphere relaxed their bows. The infantry, in contrast with its earlier status under the Persians, was wholly neglected. On the other hand, every magnate put into the field as many mounted warriors as possible, chiefly servants and bought slaves, who, like the Janissaries and Mamelukes, were trained exclusively for war. Thus Surenas, in 53 B.C., is said to have put at the king's disposal 1000 mailed horsemen and, in all, 10,000 men, including the train, which also comprised his attendants and harem (Plut. *Crass.* 21; description of the military organization; Dio Cass. 40, 15; Justin xli. 2). In the army of 50,000 mounted men which took the field against Mark Antony there were, says Justin, only 400 freemen.

How vital was the nomadic element in the Parthian Empire is obvious from the fact that, in civil wars, the deposed kings consistently took refuge among the Dahae or Scythians and were restored by them. But, in Parthia, these nomads were amalgamated with the native peasantry, and, with their religion, had adopted their dress and manners. Even the kings, after the first two or three, wear their hair and beard long, in the Iranian fashion, whereas their predecessors are beardless. Although the Arsacids are strangers to any deep religious interest (in contrast to the Achaemenids and Sassanids), they acknowledge the Persian gods and the leading tenets of Zoroastrianism. They erect fire-altars, and even obey the command to abandon all corpses to the dogs and fowls (Justin xli. 3). The union, moreover, recommended by that creed, between brother and sister—and even son and mother—occurs among them. Consequently, beside the council of the nobility, there is a second council of "Magians and wise men" (Strabo xi. 515).

The Iranian Population.

Again, they perpetuate the traditions of the Achaemenid Empire. The Arsacids assume the title "king of kings" and derive their line from Artaxerxes II. Further, the royal apotheosis, so common among them and recurring under the Sassanids, is probably not so much of Greek origin as a development of Iranian views. For at the side of the great god Ahuramazda there stands a host of subordinate divine beings who execute his will—among these the deified heroes of legend, to whose circle the king is now admitted, since on him Ahuramazda has bestowed victory and might.

This gradual Iranianization of the Parthian Empire is shown by the fact that the subsequent Iranian traditions, and Firdousi in particular, apply the name of the "Parthian" magnates (*Pahlavan*) to the glorious heroes of the legendary epoch. Consequently, also, the language and writing of the Parthian period, which are retained under the Sassanids, received the name *Pahlavi*, *i.e.* "Parthian." The script was derived from the Aramaic.

But to these Oriental elements must be added that of Hellenism, the dominant world-culture which had penetrated into Parthia and Media. It was indispensable to every state which hoped to play some part in the world and was not so utterly secluded as Persis and Atropatene; and the Arsacids entertained the less thought of opposition as they were destitute of an independent national basis. All their external institutions were borrowed from the Seleucid Empire: their coinage with its Greek inscriptions and nomenclature; their Attic standard of currency; and, doubtless, a great part of their administration also. In the towns Greek merchants were everywhere settled. Mithradates I. even followed the precedent of the Seleucids in building a new city, Arsacia, which replaced the ancient Rhagae (Rai, Europus) in Media. The further the Arsacids expanded the deeper they penetrated into the province of Hellenism; the first Mithradates himself assumed, after his great conquests, the title of *Philhellen*, "the protector of Hellenism," which was retained by almost all his successors. Then follow the surnames *Epiphanes* "the revealed god," *Dicaeus* "the just," *Euergetes* "the benefactor," all of them essentially Greek in their reference, and also regularly borne by all the kings. After the conquest of the Euphrates and Tigris provinces it was imperative that the royal residence should be fixed there. But as no one ventured to transfer the royal household and the army, with its hordes of wild horsemen, to the Greek town of Seleucia, and thus disorganize its commerce, the Arsacids set up their abode in the great village of Ctesiphon, on the left bank of the Tigris, opposite to Seleucia, which accordingly retained its free Hellenic constitution (see CTESIPHON and SELEUCIA). So, also, Orodes I. spoke good Greek, and Greek tragedies were staged at his court (Plut. *Crass.* 33).

Relation towards Hellenism.

In spite of this, however, the rise of the Arsacid Empire marks the beginning of a reaction against Hellenism—not, indeed, a conscious or official reaction, but a reaction which was all the more effective because it depended on the impetus of circumstances working with all the power of a natural force. The essential point is that the East is completely divorced from the Mediterranean and the Hellenic world, that it can derive no fresh powers from that quarter, and that, consequently, the influence of the Oriental elements must steadily increase. This process can be most clearly traced on the coins—almost the sole memorials that the Parthian Empire has left. From reign to reign the portraits grow poorer and more stereotyped, and the inscriptions more neglected, till it becomes obvious that the engraver himself no longer understood Greek but copied mechanically the signs before his eyes, as is the case with the contemporary Indo-Scythian coinage, and also in Mesene. Indeed, after Vologaeses I. (51–77), the Aramaic script is occasionally employed. The political opposition to the western empires, the Seleucids first, then the Romans, precipitated this development. Naturally enough the Greek cities beheld a liberator in every army that marched from the West, and were ever ready to cast in their lot with such—a disposition for which the subsequent penalty was not lacking. The Parthian magnates, on the other hand, with the army, would have little to do with Greek culture and Greek modes of life, which they contemptuously regarded as effeminate and unmanly. Moreover, they required of their rulers that they should live in the fashion of their country, practise arms and the chase, and appear as Oriental sultans, not as Grecian kings.

Reaction against Hellenism.

These tendencies taken together explain the radical weakness of the Parthian Empire. It was easy enough to collect a great army and achieve a great victory; it was absolutely impossible to hold the army together for any longer period, or to conduct a regular campaign. The Parthians proved incapable of creating a firm, united organization, such as the Achaemenids before them, and the Sassanids after them gave to th ir empire. The kings themselves were toys in the hands of the magnates and the army who, tenaciously as they clung to the anointed dynasty of the Arsacids, were utterly indifferent to the person of the individual Arsacid. Every moment they were ready to overthrow the reigning monarch and to seat another on his throne. The kings, for their part, sought protection in craft, treachery and cruelty, and only succeeded in aggravating the situation. More especially they saw an enemy in every prince, and the worst of enemies in their own sons. Sanguinary crimes were thus of everyday occurrence in the royal household; and frequently it was merely a matter of chance whether the father anticipated the son, or the son the father. The conditions were the same as obtained subsequently under the Mahommedan Caliphate (*q.v.*) and the empire of the Ottomans. The internal history of the Parthian dominion is an unbroken sequence of civil war and dynastic strife.

For the literature dealing with the Parthian Empire and numismatics, see PARTHIA, under which heading will be found a complete list of the kings, so far as we are able to reconstitute them.

These conditions elucidate the fact that the Parthian Empire, though founded on annexation and perpetually menaced by hostile arms in both the East and the West, yet never took a strong offensive after the days of Mithradates II. It was bound to protect itself against Scythian aggression in the East and Roman aggression in the West. To maintain, or regain, the suzerainty over Mesopotamia and the vassal states of that region, as also over Atropatene and Armenia, was its most imperative task. Yet it always remained on the defensive and even so was

Later History of the Arsacid Empire.

lacking in energy. Whenever it made an effort to enforce its claims, it retreated so soon as it was confronted by a resolute foe.

Thus the wars between Parthia and Rome proceeded, not from the Parthians—deeply injured though they were by the encroachments of Pompey—but from Rome herself. Rome had been obliged, reluctantly enough, to enter upon the inheritance of Alexander the Great; and, since the time of Pompey, had definitely subjected to her dominion the Hellenistic countries as far as the Euphrates. Thus the task now faced them of annexing the remainder of the Macedonian Empire, the whole East from the Euphrates to the Indus, and of thereby saving Greek civilization (cf. Plut. *Comp. Nic. et Crass.* 4). The aristocratic republic quailed before such an enterprise, though Lucullus, at the height of his successes, entertained the thought (Plut. *Luc.* 30). But the ambitious men, whose goal was to erect their own sovereignty on the ruins of the republic, took up the project. With this objective M. Licinius Crassus, the triumvir, in 54 B.C., took the aggressive against Parthia, the occasion being favourable owing to the dynastic troubles between Orodes I., the son of Phraates III., and his brother Mithradates III. Crassus fell on the field of Carrhae (June 9, 53 B.C.). With this Mesopotamia was regained by the Parthians, and King Artavasdes of Armenia now entered their alliance. But, apart from the ravaging of Syria (51 B.C.) by Pacorus the son of Orodes, the threatened attack on the Roman Empire was carried into effect neither then nor during the civil wars of Caesar and Pompey. At the time of his assassination Caesar was intent on resuming the expedition of Crassus. The Parthians formed a league with Brutus and Cassius, as previously with Pompey, but gave them no support, until in 40 B.C. a Parthian army, led by Pacorus and the republican general Labienus, harried Syria and Asia Minor. But it was easily repulsed by Ventidius Bassus, the lieutenant of Mark Antony. Pacorus himself fell on the 9th of June 38 B.C. at Gindarus in northern Syria. Antony then attacked the Parthians in 36 B.C., and penetrated through Armenia into Atropatene, but was defeated by Phraates IV.—who in 37 B.C. had murdered his father Orodes I.—and compelled to retreat with heavy losses. The continuation of the war was frustrated by the conflict with Octavian. Armenia alone was again subdued in 34 B.C. by Antony, who treacherously captured and executed King Artavasdes.

Wars with Crassus and Antonius.

Roman opinion universally expected that Augustus would take up the work of his predecessors, annihilate the Parthian dominion, and subdue the East as far as the Indians, Scythians and Seres (cf. Horace and the other Augustan poets). But Augustus disappointed these expectations. His whole policy and the needs of the newly organized Roman Empire demanded peace. His efforts were devoted to reaching a *modus vivendi*, by which the authority of Rome and her most vital claims might be peacefully vindicated. This the weakness of Parthia enabled him to effect without much difficulty. His endeavours were seconded by the revolt of Tiridates II., before whom Phraates IV. was compelled to flee (32 B.C.), till restored by the Scythians. Augustus lent no support to Tiridates in his second march on Ctesiphon (26 B.C.), but Phraates was all the more inclined on that account to stand on good terms with him. Consequently, in 20 B.C., he restored the standards captured in the victories over Crassus and Antony, and recognized the Roman suzerainty over Osroene and Armenia. In return, the Parthian dominion in Babylonia and the other vassal states was left undisputed.

Policy of Augustus.

Thus it was due not to the successes and strength of the Parthians but entirely to the principles of Roman policy as defined by Augustus that their empire appears as a second great independent power, side by side with Rome. The precedence of the Caesars, indeed, was always admitted by the Arsacids; and Phraates IV. soon entered into a state of dependency on Rome by sending (9 B.C.) four of his sons as hostages to Augustus—a convenient method of obviating the danger threatened in their person, without the necessity of killing them. In 4 B.C., however, Phraates was assassinated by his favourite wife Musa and her son Phraates V. In the subsequent broils a Parthian faction obtained the release of one of the princes interned in Rome as Vonones I. (A.D. 8). He failed, however, to maintain his position for long. He was a stranger to the Parthian customs, and the feeling of shame at dependency on the foreigner was too strong. So the rival faction brought out another Arsacid, resident among the Scythian nomads, Artabanus II., who easily expelled Vonones—only to create a host of enemies by his brutal cruelty, and to call forth fresh disorders.

Similar proceedings were frequently repeated in the period following. In the intervals the Parthians made several attempts to reassert their dominion over Armenia and there install an Arsacid prince; but on each occasion they retreated without giving battle so soon as the Romans prepared for war. Only the dynasty of Atropatene was finally deposed and the country placed under an Arsacid ruler. Actual war with Rome broke out under Vologaeses I. (51–77), who made his brother Tiridates king of Armenia. After protracted hostilities, in which the Roman army was commanded by Cn. Domitius Corbulo, a peace was concluded in A.D. 63, confirming the Roman suzerainty over Armenia but recognizing Tiridates as king (see CORBULO). Tiridates himself visited Rome and was there invested with the diadem by Nero (A.D. 66). After that Armenia continued under the rule of an Arsacid dynasty.

Reign of Vologaeses I.

These successes of Vologaeses were counterbalanced by serious losses in the East. He was hampered in an energetic campaign against Rome by attacks of the Dahae and Sacae. Hyrcania, also, revolted and asserted its independence under a separate line of kings. A little later, the Alans, a great Iranian tribe in the south of Russia—the ancestors of the present-day Ossets—broke for the first time through the Caucasian passes, and ravaged Media and Armenia—an incursion which they often repeated in the following centuries.

On the other side, the reign of Vologaeses I. is characterized by a great advance in the Oriental reaction against Hellenism. The line of Arsacids which came to the throne in the person of Artabanus II. (A.D. 10) stands in open opposition to the old kings with their leanings to Rome and, at least external, tinge of Hellenism. The new régime obviously laid much more stress on the Oriental character of their state, though Philostratus, in his life of Apollonius of Tyana (who visited the Parthian court), states that Vardanes I. (A.D. 40–45), the rival king to the brutal Gotarzes (A.D. 40–51), was a cultivated man (*Vit. Ap.* i. 22, 28, 31 sqq.); and Vologaeses I. is distinguished by the excellent relations which subsisted all his life between himself and his brothers Pacorus and Tiridates, the kings of Media and Armenia. But the coins of Vologaeses I. are quite barbarous, and for the first time on some of them appear the initials of the name of the king in Aramaic letters by the side of the Greek legend. The Hellenism of Seleucia was now attacked with greater determination. For seven years (A.D. 37–43) the city maintained itself in open rebellion (Tac. *Ann.* xi. 8 seq.), till at last it surrendered to Vardanes, who in consequence enlarged Ctesiphon, which was afterwards fortified by Pacorus (A.D. 78–105: v. Ammian. 23, 6, 23). In the neighbourhood of the same town Vologaeses I. founded a city Vologesocerta (Balashkert), to which he attempted to transplant the population of Seleucia (Plin. vi. 122: cf. Th. Nöldeke in *Zeitschr. d. deutsch. morgenl. Gesellschaft*, xxviii. 100). Another of his foundations was Vologesias (the Arabian *Ullaish*), situated near Hira on the Euphrates, south of Babylon, which did appreciable damage to the commerce of Seleucia and is often mentioned in inscriptions as the destination of the Palmyrene caravans.

After Vologaeses I. follows a period of great disturbances. The literary tradition, indeed, deserts us almost entirely, but the coins and isolated literary references prove that during the years A.D. 77 to 147, two kings, and sometimes three or more, were often reigning concurrently (Vologaeses II. 77–79, and 111–147; Pacorus 78–*c.* 105; Osroes 106–129; Mithradates V. 129–147: also Artabanus III. 80–81; Mithradates IV. and his

son Sanatruces II. 115; and Parthamaspates 116–117). Obviously the empire can never have been at peace during these years, a fact which materially assisted the aggressive campaigns of Trajan (113–117). Trajan resuscitated the old project of Crassus and Caesar, by which the empire of Alexander as far as India was to be won for Western civilization. In pursuance of this plan he reduced Armenia, Mesopotamia and Babylonia to the position of imperial provinces. On his death, however, Hadrian immediately reverted to the Augustan policy and restored the conquests. Simultaneously there arose in the East the powerful Indo-Scythian empire of the Kushana, which doubtless limited still further the Parthian possessions in eastern Iran.

Wars with Trajan and Marcus Aurelius.

An era of quiet seems to have returned with Vologaeses III. (147–191), and we hear no more of rival kings. With the Roman Empire a profound peace had reigned since Hadrian (117), which was first disturbed by the attack of Marcus Aurelius and Aelius Verus in 162. This war, which broke out on the question of Armenia and Osroene, proved of decisive significance for the future development of the East, for, in its course, Seleucia was destroyed by the Romans under Avidius Cassius (164). The downfall of the great Greek city sealed the fate of Hellenism in the countries east of the Euphrates. Henceforward Greek culture practically vanishes and gives place to Aramaic; it is significant that in future the kings of Mesene stamped their coinage with Aramaic legends. This Aramaic victory was powerfully aided by the ever-increasing progress of Christianity, which soon created, as is well known, an Aramaic literature of which the language was the dialect of Edessa, a city in which the last king of Osroene, Abgar IX. (179–214), had been converted to the faith. After that Greek culture and Greek literature were only accessible to the Orientals in an Aramaic dress. Vologaeses III. is probably also the king Valgash, who, according to a native tradition, preserved in the *Dinkart*, began a collection of the sacred writings of Zoroaster—the origin of the *Avesta* which has come down to us. This would show how the national Iranian element in the Parthian Empire was continually gathering strength.

Christianity.

The Roman war was closed in 165 by a peace which ceded north-west Mesopotamia to Rome. Similar conflicts took place in 195–202 between Vologaeses IV. (191–209) and Septimius Severus, and again in 216–217 between Artabanus IV. (209–226) and Caracalla. They failed, however, to affect materially the position of the two empires.

VIII. *The Sassanian Empire.*—That the Arsacid Empire should have endured some 350 years after its foundation by Mithradates I. and Phraates II., was a result, not of internal strength, but of chance working in its external development. It might equally well have so existed for centuries more. But under Artabanus IV. the catastrophe came. In his days there arose in Persis—precisely as Cyrus had arisen under Astyages the Mede—a great personality. Ardashir (Artaxerxes) I., son of Papak (Babek), the descendant of Sasan, was the sovereign of one of the small states into which Persis had gradually fallen. His father Papak had taken possession of the district of Istakhr, which had replaced the old Persepolis, long a mass of ruins. Thence Ardashir I., who reigned from about A.D. 212, subdued the neighbouring potentates—disposing of his own brothers among the rest. This proceeding quickly led to war with his suzerain Artabanus IV. The conflict was protracted through several years, and the Parthians were worsted in three battles. The last of these witnessed the fall of Artabanus (A.D. 226), though a Parthian king, Artavasdes—perhaps a son of Artabanus IV.—who is only known to us from his own coins, appears to have retained a portion of the empire for some time longer. The members of the Arsacid line who fell into the hands of the victor were put to death; a number of the princes found refuge in Armenia, where the Arsacid dynasty maintained itself till A.D. 429. The remainder of the vassal states—Carmania, Susiana, Mesene—were ended by Ardashir; and the autonomous desert fortress of Hatra in Mesopotamia was destroyed by his son Shapur (Sapor) I., according to the Persian and Arabian traditions, which, in this point, are deserving of credence. The victorious Ardashir then took possession of the palace of Ctesiphon and assumed the title "King of the kings of the Iranians" (*βασιλεὺς βασιλέων Ἀριανῶν*).

Ardashir I.

The new empire founded by Ardashir I.—the Sassanian, or Neo-Persian Empire—is essentially different from that of his Arsacid predecessors. It is, rather, a continuation of the Achaemenid traditions which were still alive on their native soil. Consequently the national impetus—already clearly revealed in the title of the new sovereign—again becomes strikingly manifest. The Sassanian Empire, in fact, is once more a national Persian or Iranian Empire. The religious element is, of course, inseparable from the national, and Ardashir, like all the dynasts of Persis, was an ardent devotee of the Zoroastrian doctrine, and closely connected with the priesthood. In his royal style he assumed the designation "Mazdayasnian" (*Μασδάσνας*), and the fire-cult was everywhere vigorously disseminated. Simultaneously the old claims to world dominion made their reappearance. After the defeat of Artabanus, Ardashir, as heir of the Achaemenids, formulated his pretensions to the dominion of western Asia (Dio. Cass. 80, 3; Herodian vi. 2, 4; Zonar. xii. 15; similarly under Shapur II: Ammian. Marc. xvii. 5, 5). He attacked Armenia, though without permanent success (cf. von Gutschmid in *Zeitschr. d. d. morgenl. Ges.* xxxi. 47, on the fabulous Armenian account of these wars), and despatched his armies against Roman Mesopotamia. They strayed as far as Syria and Cappadocia. The inner decay of the Roman Empire, and the widespread tendency of its troops to mutiny and usurpation, favoured his enterprise. Nevertheless, the armies of Alexander Severus, supported by the king of Armenia, succeeded in repelling the Persians, though the Romans sustained severe losses (231–233). Towards the end of his reign Ardashir resumed the attack; while his son Shapur I. (241–272) reduced Nisibis and Carrhae and penetrated into Syria, but was defeated by Gordian III. at Resaena (243). Soon afterwards, however, the Roman Empire seemed to collapse utterly. The Goths defeated Decius (251) and harried the Balkan Peninsula and Asia Minor, while insurrections broke out everywhere and the legions created one Caesar after the other. Then Shapur resumed the war, subdued Armenia and plundered Antioch. The emperor Valerian, who marched to encounter him, was overthrown at Edessa and taken prisoner (260). The Persian armies advanced into Cappadocia; but here Ballista or Balista (d. *c.* 264) beat them back, and Odenathus (Odainath), prince of Palmyra (*q.v.*), rose in their rear, defeated Shapur, captured his harem, and twice forced his way to Ctesiphon (263–265). Shapur was in no position to repair the defeat, or even to hold Armenia; so that the Sassanid power failed to pass the bounds of the Arsacid Empire. Nevertheless Shapur I., in contrast to his father, assumed the title "King of the kings of the Iranians and non-Iranians" (*βασιλεὺς βασιλέων Ἀριανῶν καὶ Ἀναριανῶν*; *shah an shah Iran we Aniran*), thus emphasizing his claim to world dominion. His successors retained the designation, little as it corresponded to the facts, for the single non-Iranian land governed by the Sassanids was, as under the Parthians, the district of the Tigris and Euphrates as far as the Mesopotamian desert; western and northern Mesopotamia remained Roman.

Sassanian Wars with Rome.

Shapur I.

The Sassanid ruler is the representative of the "Kingly Majesty," derived from Ormuzd, which appears in the *Avesta* as the angel Kavaem Hvareno, "the royal glory," and, according to legend, once beamed in the Iranian kings, unattainable to all but those of royal blood. A picture, which frequently recurs in the rock-reliefs of Ardashir I. and Shapur I., represents the king and the god Ormuzd both on horseback, the latter in the act of handing to his companion the ring of sovereignty. Thus it is explicable that all the Sassanids, as many of the Arsacids before them, include the designation of "god" in their formal style. From this developed (as already under the Arsacids) that strict principle of legitimacy which is still vigorous in Firdousi. It applies, however, to the whole royal house, precisely as in the Ottoman Empire of to-day. The person of the individual ruler

Organization.

is, on the other hand, a matter of indifference. He can readily be removed and replaced by another; but no usurper who was not of the legitimate blood can hope to become the genuine king. Therefore the native tradition carries the Sassanid line back to the Achaemenids and, still further, to the kings of the legendary period.

Officially the king is all-powerful, and his will, which is guided by God and bound up in His law, unfettered. Thus, externally, he is surrounded by all the splendour of sovereignty; on his head he wears a great and resplendent crown, with a high circular centrepiece; he is clothed in gold and jewels; round him is a brilliant court, composed of his submissive servants. He sits in dazzling state on his throne in Ctesiphon. All who approach fling themselves to the ground, life and death depend on his nod. Among his people he is accounted the fairest, strongest and wisest man of the empire; and from him is required the practice of all piety and virtue, as well as skill in the chase and in arms—especially the bow. Ardashir I., moreover, and his successors endeavoured to establish the validity of the royal will by absorbing the vassal states and instituting a firmer organization. Nevertheless they failed to attain the complete independence and power of the Achaemenids. Not strong enough to break up the nobility, with its great estates, they were forced to utilize its services and still further to promote its interests; while their dependence on its good will and assistance led inevitably to incessant gifts of money, lands and men. This state of affairs had also prevailed under the later Achaemenids, and had materially contributed to the disintegration of the empire and the numerous insurrections of the satraps. But the older Achaemenids held an entirely different position; and hardly a single Sassanid enjoyed even that degree of power which was still retained by the later Achaemenids. It was of fundamental importance that the Sassanian Empire could not make good its claim to world dominion; and, in spite of the title of its kings, it always remained essentially the kingdom of Iran—or rather west Iran, together with the districts on the Tigris and Euphrates. This fact, again, is most closely connected with its military and administrative organization. The external and internal conditions of the empire are in mutual reaction upon one another. The empire, which in extent did not exceed that of the Arsacids with its vassal states, was protected on the east and west by the great deserts of central Iran and Mesopotamia. For the defence of these provinces the mounted archers, who formed the basis of the army, possessed adequate strength; and though the Scythian nomads from the east, or the Romans from the west, might occasionally penetrate deep into the country, they never succeeded in maintaining their position. But the power of the neo-Persian Empire was not great enough for further conquests, though its army was capable and animated by a far stronger national feeling than that of the Parthians. It still consisted, however, of levies from the retinue of the magnates led by their territorial lords; and, although these troops would stream in at the beginning of a war, they could not be kept permanently together. For, on the one hand, they were actuated by the most varied personal interests and antipathies, not all of which the king could satisfy; on the other hand he could not, owing to the natural character and organization of his dominions, maintain and pay a large army for any length of time. Thus the great hosts soon melted away, and a war, begun successfully, ended ingloriously, and often disastrously. Under such circumstances an elaborate tactical organization employing different species of arms, or the execution of a comprehensive plan of campaign, was out of the question. The successes of the Sassanids in the east were gained in the later period of their dominion; and the Roman armies, in spite of decay in discipline and military spirit, still remained their tactical and strategical superiors. A great victory might be won—even an emperor might be captured, like Valerian—but immediately afterwards successes, such as those gained against Shapur I. (who was certainly an able general) by Ballista and Odenathus of Palmyra, or the later victories of Carus, Julian and others, demonstrated how far the Persians were from being on an equality with the Romans. That Babylonia permanently remained a Sassanian province was due merely to the geographical conditions and to the political situation of the Roman Empire, not to the strength of the Persians.

Military Achievements.

Among the magnates six great houses—seven, if we include the royal house—were still regarded as the foremost, precisely as under the Achaemenids, and from these were drawn the generals, crown officials and governors (cf. Procop. *Pers.* i. 6, 13 sqq.). In the last of these positions we frequently find princes of the blood, who then bear the royal title (shah). Some of these houses—whose origin the legends derive from King Gushtasp (*i.e.* Vishtaspa), the protector of Zoroaster (Marquart, *Zeitschr. d. d. morgenl. Ges.* xlix. 635 sqq.)—already existed under the Arsacids, *e.g.* the Suren (Surenas, *vide supra*, p. 798) and Karen (Carenes, Tac. *Ann.* xii. 12 sqq.), who had obviously embraced the cause of the victorious dynasty at the correct moment and so retained their position. The name Pahlavan, moreover, which denoted the Parthian magnates, passed over into the new empire. Below these there was an inferior nobility, the *dikhans* ("village-lords") and the "knights" (*aswar*); who, as among the Parthians, took the field in heavy scale-armour. To an even greater extent than under the Arsacids the empire was subdivided into a host of small provinces, at the head of each being a *Marzban* ("boundary-lord," "lord of the marches"). These were again comprised in four great districts. With each of these local potentates the king could deal with as scant consideration as he pleased, always provided that he had the power or understood the art of making himself feared. But to break through the system or replace it by another was impossible. In fact he was compelled to proceed with great caution whenever he wished to elevate a favourite of humbler origin to an office which custom reserved for the nobility. Thus it is all the more worthy of recognition that the Sassanian Empire was a fairly orderly empire, with an excellent legal administration, and that the later sovereigns did their utmost to repress the encroachments of the nobility, to protect the commonalty, and, above all, to carry out a just system of taxation.

The Nobility.

Side by side with the nobles ranked the spiritual chiefs, now a far more powerful body than under the Arsacids. Every larger district had its upper Magian (*Magupat, mobed, i.e.* "Lord of the Magians"). At their head was the supreme Mobed, resident in Rhagae (Rai), who was regarded as the successor of Zoroaster. In the new empire, of which the king and people were alike zealous professors of the true faith, their influence was extraordinarily strong (cf. Agathias ii. 26)—comparable to the influence of the priesthood in later Egypt, and especially in Byzantium and medieval Christendom. As has already been indicated, it was in their religious attitudes that the essential difference lay between the Sassanid Empire and the older Iranian states. But, in details, the fluctuations were so manifold that it is necessary at this point to enter more fully into the history of Persian religion (cf. especially H. Gelzer, "Eznik u. d. Entwickel. des pers. Religions-systems," in the *Zeitschr. f. armen. Philol.* i. 149 sqq.).

Religious Development.

The Persian religion, as we have seen, spread more and more widely after the Achaemenian period. In the Indo-Scythian Empire the Persian gods were zealously worshipped; in Armenia the old national religion was almost entirely banished by the Persian cults (Gelzer, "Zur armen. Götterlehre," in *Ber. d. sächs. Gesch. d. Wissensch.*, 1895); in Cappadocia, North Syria and the west of Asia Minor, the Persian gods were everywhere adored side by side with the native deities. It was in the third century that the cult of Mithras, with its mysteries and a theology evolved from Zoroastrianism, attained the widest diffusion in all Latin-speaking provinces of the Roman dominion; and it even seemed for a while as though the *Sol invictus Mithras*, highly favoured by the Caesars, would become the official deity-in-chief of the empire. But in all these cults the Persian gods are perfectly tolerant of other native or foreign divinities; vigorous as was their propagandism, it was yet equally far removed from an attack on other creeds. Thus this Parseeism always bears a syncretic character; and the supreme god of Zoroastrian theory, Ahuramazda (*i.e.* Zeus or Jupiter), in practice yields place to his attendant deities, who work in the world and are able to lead the believer, who has been initiated and keeps the commandments of purity, to salvation.

But, meanwhile, in its Iranian home and especially in Persis, the religion of Zoroaster lived a quiet life, undisturbed by the proceedings of the outside world. Here the poems of the prophet and fragments of ancient religious literature survived, understood by the Magians and rendered accessible to the faithful laity by versions in the modern dialect (Pahlavi). Here the opposition between the good spirit of light and the demons of evil—between Ormuzd and Ahriman—still remained the principal dogma of the creed; while all other gods and angels, however estimable their aid, were but subordinate servants of Ormuzd, whose highest manifestation on earth was not the sun-god Mithras, but the holy fire guarded by his priests. Here all the prescriptions of purity—partly connected with national customs, and impossible of execution abroad—were diligently observed; and even the injunction not to pollute earth with corpses, but to cast out the dead to vulture and dog, was obeyed in its full force. At the same time Ahuramazda preserved his character as a national god, who bestowed on his worshippers victory and world dominion. In the sculptures of the Sassanids, as also in Armenian traditions, he appears on horseback as a war-god. Here, again, the theology was further developed, and an attempt made to annul the old dualism by envisaging both Ormuzd and Ahriman as emanations of an original principle of infinite time (Zervan), a doctrine which long enjoyed official validity under the Sassanids till, in the reign of Chosroes I., "the sect of Zervanites" was pronounced heretical.[1] But, above all, the ritual and the doctrine of purity were elaborated and expanded, and there was evolved a complete and detailed system of casuistry, dealing with all things allowed and forbidden, the forms of pollution and the expiation for each, &c., which, in its arid and spiritless monotony vividly recalls the similar prescriptions in the Pentateuch. The consequences of this development were that orthodoxy and literal obedience to all priestly injunctions now assumed an importance far greater than previously; henceforward, the great commandment of Zoroastrianism, as of Judaism, is to combat the heresies

[1] It may be observed that this innovation was also known to the Mithras-cult of the West, where Zervan appears as *aldv.*

of the heathen, a movement which had already had an energetic representative in the prophet himself. Heathenish cults and forbidden manners and customs are a pollution to the land and a deep insult to the true God. Therefore the duty of the believer is to combat and destroy the unbeliever and the heretic. In short, the tolerance of the Achaemenids and the indifference of the Arsacids are now replaced by intolerance and religious persecution.

Such were the views in which Ardashir I. grew up, and in their energetic prosecution he found a potent instrument for the building up of his empire. It has previously been mentioned that Vologaeses III. had already begun a collection of the holy writings; and the task was resumed under Ardashir. At his order the orthodox doctrines and texts were compiled by the high priest Jansar; all divergent theories were prohibited and their adherents proscribed. Thus arose the *Avesta*, the sacred book of the Parsees. Above all, the sacred book of laws, the *Vendidad*, breathes throughout the spirit of the Sassanian period, in its intolerance, its casuistry degenerating into absurdity, and its soulless monotony. Subscription to the restored orthodox doctrine was to the Iranian a matter of course. The schismatics Ardashir imprisoned for a year; if, at its expiration, they still refused to listen to reason, and remained stiff-necked, they were executed. It is even related that, in his zeal for uniformity of creed, Ardashir wished to extinguish the holy fires in the great cities of the empire and the Parthian vassal states, with the exception of that which burned in the residence of the dynasty. This plan he was unable to execute. In Armenia, also, Ardashir and Shapur, during the period of their occupation, sought to introduce the orthodox religion, destroyed the heathen images—even those of the Iranian gods which were here considered heathen,—and turned the shrines into fire-altars (Gelzer, *Ber. sachs. Ges.* p. 135, 1895). Shapur I., who appears to have had a broader outlook, added to the religious writings a collection of scientific treatises on medicine, astronomy, mathematics, philosophy, zoology, &c., partly from Indian and Greek sources.

This religious development was most strongly influenced by the fact that, meanwhile, a powerful opponent of Zoroastrianism had arisen with an equally zealous propagandism and an equal exclusiveness and intolerance. More especially in the countries of the Tigris and Euphrates, now altogether Aramaic, Christianity had everywhere gained a firm footing.[1] But its missionary enterprise stretched over the whole of Iran, and even farther. The time was come when, in the western and eastern worlds alike, the religious question was for large masses of people the most important question in life, and the diffusion of their own creed and the suppression of all others the highest and holiest of tasks. The man who thinks thus knows no compromise, and so Zoroastrianism and Christianity confronted each other as mortal enemies. Still the old idea that every religion contained a portion of the truth, and that it was possible to borrow something from one and amalgamate it with another, had not yet lost all its power. From such a conception arose the teaching of Mani or Manes. For Manichaeism (*q.v.*) is an attempt to weld the doctrine of the Gospel and the doctrine of Zoroaster into a uniform system, though naturally not without an admixture of other elements, principally Babylonian and Gnostic. Mani, perhaps a Persian from Babylonia, is said to have made his first appearance as a teacher on the coronation day of Shapur I. At all events he found numerous adherents, both at court and among the magnates of the empire. The king even inclined to him, till in a great disputation the Magians gained the predominance. None the less Mani found means to diffuse his creed far and wide over the whole empire. Even the heir to the throne, Hormizd I. (reigned 272-273), was favourably disposed to him; but Shapur's younger son, Bahram I. (273-276), yielded to sacerdotal pressure, and Mani was executed. After that Manichaeism was persecuted and extirpated in Iran. Yet it maintained itself not merely in the west, where its head resided at Babylon—propagating thence far into the Roman Empire—but also in the east, in Khorasan and beyond the bounds of the Sassanian dominion. There the seat of its pontiff was at Samarkand; thence it penetrated into Central Asia, where, buried in the desert sands which entomb the cities of eastern Turkestan, numerous fragments of the works of Mani and his disciples, in the Persian language (Pahlavi) and Syrian script, and in an East Iranian dialect, called Sogdian, which was used by the Manichaeans of Central Asia, have been discovered (K. Müller, "Handschriftenreste in Estrangelo-schrift aus Turfan, in Chinesisch-Turkestan," in *Abh. d. berl. Akad.*, 1904); among them translations of texts of the New Testament (K Müller, *Berichte der Berl.*, 1907, p. 260 seq.). In these texts God the Father is identified with the Zervan of Zarathustrism, the devil with Ahriman. The further religious development of the Sassanid Empire will be touched upon later.

Relation to Christianity. ***Manichaeism.***

[1] For the propagation and history of the Christians in the Sassanid Empire, cf. Labourt, *Le Christianisme dans l'empire perse sous la dynastie sassanide* (1904); Harnack, *Die Mission und Ausbreitung des Christenthums in den ersten drei Jahrhunderten*, 2 Aufl. (1906), Bd. II. p. 121 seq.; Chabot, *Synodicon orientale* (1902) (a collection of the acts of the Nestorian synods held under the rule of the Sassanids).

Like the Arsacids the kings resided in Ctesiphon, where, out of the vast palace built by Chosroes I., a portion at least of the great hall is still erect. On the ruins of Seleucia, on the opposite bank of the Tigris, Ardashir I. built the city of Veh-Ardashir ("good is Ardashir"), to which the later kings added new towns, or rather new quarters. In Susiana Shapur I. built the great city of Gondev-Shapur, which succeeded the ancient capital of the Persian Empire. At the same time the mother-country again gained importance; especially the capital of Persis, Istakhr, which had replaced the former Persepolis (now the ruins of Hajji abad). Farther in the south-east, Ardashir I. built Gur (now Firuzabad), under the name of Ardashir-khurre ("the glory of Ardashir"). At these places and in Sarwistan, near Shiraz and elsewhere, he ruins of the Sassanid palaces, which in their design go back to the Achaemenid architecture, blending with it, however, Graeco-Syrian elements and serving in their turn as models for the structures of the Caliphs (see ARCHITECTURE: § *Sassanian*). After its long quiescence under the Arsacids native art underwent a general renaissance, which, though not aspiring to the Achaemenian creations, was still of no small importance. Of the Sassanian rock-sculptures some have already been mentioned; besides these, numerous engraved signet-stones have been preserved. The metal-work, carpets and fabrics of this period enjoyed a high reputation; they were widely distributed and even influenced western art.

Architecture and Arts.

In the intellectual life and literature of the Sassanid era the main characteristic is the complete disappearance of Hellenism and the Greek language. Ardashir I. and Shapur I. still appended Greek translations to some of their inscriptions; but all of later date are drawn up in Pahlavi alone. The coins invariably bear a Pahlavi legend—on the obverse the king's head with his name and title; on the reverse, a fire-altar (generally with the ascription "fire of Ardashir, Shapur, &c.," *i.e.* the fire of the royal palace), and the name of the place of coinage, usually abbreviated. The real missionaries of culture in the empire were the Aramaeans (Syrians), who were connected with the West by their Christianity, and in their translations diffused Greek literature through the Orient. But there also developed a rather extensive Pahlavi literature, not limited to religious subjects, but containing works in *belles-lettres*, modernizations of the old Iranian sagas and native traditions, *e.g.* the surviving fabulous history of Ardashir I., ethical tales, &c.; with translations of foreign literature, principally Indian,—one instance being the celebrated book of tales *Kalilah and Dimnah* (see SYRIAC LITERATURE), dating from Chosroes I., in whose reign chess also was introduced from India.

Literature.

AUTHORITIES.—Side by side with the accounts of Roman and Greek authors stands the indigenous tradition which, especially for the later years of the empire, is generally trustworthy. It goes back to a native work, the *Khudai nama* ("book of lords"), compiled under Chosroes I. and continued to Yazdegerd III. Its narrations are principally preserved in Tabari, though there combined with numerous Arabian traditions; also in the poetical adaptation of Firdousi. To these may be added Syrian accounts, particularly in the martyrologies, which have been excellently treated by G. Hoffmann, *Auszüge aus syrischen Akten persischer Martyrer* (1880); also the statements of the Armenian historians.

The fundamental work on Sassanian history is Theodor Nöldeke's *Gesch. der Perser u. Araber zur Zeit der Sassaniden, aus der arabischen Chronik des Tabari* (1879, trans. with notes and excursuses chiefly on the chronology and organization of the empire). On this is based Nöldeke's *Aufsätze zur pers. Gesch.* (1887; containing a history of the Sassanian Empire, pp. 86 sqq.). The only other works requiring mention are: G. Rawlinson, *The Seventh Great Oriental Monarchy* (1876), and F. Justi's sketch in the *Grundriss der iranischen Philologie*, vol. ii. (1904). For the geography and numerous details of administration: J. Marquart, Eranshahr (*Abh. d. götting. Ges. d. Wissensch.*, 1901). For the numismatology the works of A. D. Mordtmann are of prime importance, especially his articles in the *Zeitschr. d. d. morgenl. Ges.* (1879), xxxiii. 113 sqq. and xxxiv. 1 sqq. (1880), where the inscriptions of the individual kings are also enumerated. Also Nöldeke, ibid. xxxi. 147 sqq. (1877). For facsimiles of coins the principal work is J. de Bartholomaei, *Collection de monnaies sassanides* (2nd ed., St Petersburg, 1875). For the inscriptions: Edward Thomas, "Early Sassanian Inscriptions," *Journ. R. A. Soc.* vol. ii. (1868); West, "Pahlavi Literature" in the *Grundriss d. iran. Philol.* vol. ii. For the monuments: Flandin and Coste, *Voyage en Perse* (1851); Stolze, *Persepolis* (1882); Fr. Sarre, *Iran. Felsreliefs a. d. Z. der Achaemeniden und Sassaniden* (1908).

History of the Sassanian Empire.

remained as of old, the defence and, when possible, the expansion of the eastern and western frontiers. In the first two centuries of the Sassanid Empire we hear practically nothing of its relations with the East. Only occasional notices show that the inroads of the Oriental nomads had not ceased, and that the extent of the empire had by no means exceeded the bounds of the Parthian dominion—Sacastene (Seistan) and western Afghanistan. Far to the east, on both sides of the Indus, the Kushana Empire was still in existence, though it was already hastening to decay, and about A.D. 320 was displaced from its position in India by the Gupta dynasty. In the west the old conflict for Osroene and northern Mesopotamia (now Roman provinces), with the fortresses of Edessa, Carrhae and Nisibis, still smouldered. Armenia the Sassanids were all the more eager to regain, since there the Arsacid dynasty still survived and turned for protection to Rome, with whom, in consequence, new wars perpetually broke out. In the reign of Bahram II. (276–293), the emperor Carus, burning to avenge the disaster of Valerian, penetrated into Mesopotamia without meeting opposition, and reduced Coche (near Seleucia) and Ctesiphon; but his sudden death, in December of 283, precluded further success, and the Roman army returned home. Bahram, however, was unable to effect anything, as his brother Hormizd was in arms, supported by the Sacae and other tribes (Mamertin, *Panegyr. Maximin.* 7. 10; *Genethl. Maximin.* 5, 17). He chose, consequently, to buy peace with Diocletian by means of presents. Some years later his uncle and successor, Narses, after subduing his rival Bahram III., occupied Armenia and defeated the emperor Galerius at Callinicum (296). But in the following year he sustained a severe reverse in Armenia, in which he lost his war-chest and harem. He then concluded a peace, by the terms of which Armenia remained under Roman suzerainty, and the steppes of northern Mesopotamia, with Singara and the hill-country on the left bank of the Tigris as far as Gordyene, were ceded to the victor (Ammian. Marc. xxv. 7, 9; Petr. Patr. *fr.* 13, 14; Rufus, *brev.* 25). In return Narses regained his household. This peace, ratified in 297 and completely expelling the Sassanids from the disputed districts, lasted for forty years.

For the rest, practically nothing is known of the history of the first six successors of Shapur I. After the death of Hormizd II. (302–310), the son of Narses, the magnates imprisoned or put to death his adult sons, one of whom, Hormisdas, later escaped to the Romans, who used him as a pretender in their wars. Shapur II., a posthumous child of the late king, was then raised to the throne, a proof that the great magnates held the sovereignty in their own hands and attempted to order matters at their own pleasure. Shapur, however, when he came to manhood proved himself an independent and energetic ruler.

Shapur II. Persecution of the Christians.

Meanwhile the Roman Empire had become Christian, the sequel of which was that the Syro-Christian population of Mesopotamia and Babylonia—even more than the Hellenic cities in former times—gravitated to the west and looked to Rome for deliverance from the infidel yoke. On similar grounds Christianity, as opposed to the Mazdaism enforced officially by the Sassanids, became predominant in Armenia. Between these two great creeds the old Armenian religion was unable to hold its own; as early as A.D. 294 King Tiridates was converted by Gregory the Illuminator and adopted the Christian faith. For this very reason the Sassanid Empire was the more constrained to champion Zoroastrianism. It was under Shapur II. that the compilation of the *Avesta* was completed and the state orthodoxy perfected by the chief *mobed*, Aturpad. All heresy was proscribed by the state, defection from the true faith pronounced a capital crime, and the persecution of the heterodox—particularly the Christians—began (cf. Sachall, "Die rechtlichen Verhältnisse der Christen in Sassanidenreich," in *Mitteilungen des Seminars für orientalische Sprachen für Berlin*, Bd. X., Abt. 2, 1907). Thus the duel between the two great empires now becomes simultaneously a duel between the two religions.

In such a position of affairs a fresh war with Rome was inevitable.[1] It was begun by Shapur in A.D. 337, the year that saw the death of Constantine the Great. The conflict centred round the Mesopotamian fortresses; Shapur thrice besieged Nisibis without success, but reduced several others, as Amida (359) and Singara (360), and transplanted great masses of inhabitants into Susiana. The emperor Constantius conducted the war feebly and was consistently beaten in the field. But, in spite of all, Shapur found it impossible to penetrate deeper into the Roman territory. He was hampered by the attack of nomadic tribes in the east, among whom the Chionites now begin to be mentioned. Year after year he took the field against them (353–358), till finally he compelled them to support him with auxiliaries (Ammian. Marc. 14, 3; 16, 9; 17, 5; 18, 4, 6). With this war is evidently connected the foundation of the great town New-Shapur (Nishapur) in Khorasan.

By the resolution of Julian (363) to begin an energetic attack on the Persian Empire, the conflict, after the lapse of a quarter of a century, assumed a new phase. Julian pressed forward to Ctesiphon but succumbed to a wound; and his successor Jovian soon found himself in such straits, that he could only extricate himself and his army by a disgraceful peace at the close of 363, which ceded the possessions on the Tigris and the great fortress of Nisibis, and pledged Rome to abandon Armenia and her Arsacid protégé, Arsaces III., to the Persian.

Shapur endeavoured to occupy Armenia and introduce the Zoroastrian orthodoxy. He captured Arsaces III. by treachery and compelled him to commit suicide; but the Armenian magnates proved refractory, placed Arsaces' son Pap on the throne, and found secret support among the Romans. This all but led to a new war; but in 374 Valens sacrificed Pap and had him killed in Tarsus. The subsequent invasions of the Goths, in battle with whom Valens fell at Adrianople (375), definitely precluded Roman intervention; and the end of the Armenian troubles was that (*c.* 390) Barham IV. and Theodosius the Great concluded a treaty which abandoned the extreme west of Armenia to the Romans and confirmed the remainder in the Persian possession. Thus peace and friendship could at last exist with Rome; and in 408 Yazdegerd I. contracted an alliance with Theodosius II. In Armenia the Persians immediately removed the last kings of the house of Arsaces (430), and thenceforward the main portion of the country remained a Persian province under the control of a marzban, though the Armenian nobles still made repeated attempts at insurrection. The introduction of Zoroastrianism was abandoned; Christianity was already far too deeply rooted. But the sequel to the Roman sacrifice of Armenian interests was that the Armenian Christians now seceded from the orthodoxy of Rome and Constantinople, and organized themselves into an independent national church. This church was due, before all, to the efforts of the Catholicos Sahak (390–439), whose colleague Mesrob, by his translation of the Bible, laid the foundations of an Armenian literature (see ARMENIAN CHURCH).

Conquest of Armenia.

Yazdegerd I.

In the interior of the Sassanian Empire the old troubles broke out anew on the death of Shapur II. (379). At first the magnates raised his aged brother Ardashir II. to the throne, then in 383 deposed him and enthroned Shapur's son as Shapur III. In 388, however, he was assassinated, as was also his brother, Bahram IV., in 399. But the son of the latter, Yazdegerd I. (399–420), was an energetic and intelligent sovereign, who held the magnates within bounds and severely chastised their attempts at encroachment. He even sought to emancipate himself from the Magian Church,

Hormizd IV., 579–590.	(Shahrbaraz, 630.)
Chosroes II., *Parvez*, 590–628.	(Boran and others, 630–632.)
	Yazdegerd III., 632–651.

On most of these kings there are separate articles.

[1] For the succeeding events see also under ROME: *Ancient History*; and articles on the Roman emperors and Persian kings.

put an end to the persecutions, and allowed the Persian Christians an individual organization. In the Persian tradition he is consequently known as "the sinner." In the end he was probably assassinated. So great was the bitterness against him that the magnates would admit none of his sons to the throne. One of them, however, Bahram V., found an auxiliary in the Arab chief Mondhir, who had founded a principality in Hira, west of the lower Euphrates; and, as he pledged himself to govern otherwise than his father, he received general recognition. This pledge he redeemed, and he is, in consequence, the darling of Persian tradition, which bestows on him the title of *Gor* ("the wild ass"), and is eloquent on his adventures in the chase and in love. This reversal of policy led to a Christian persecution and a new war with Rome. Bahram, however, was worsted; and in the peace of 422 Persia agreed to allow the Christians free exercise of their religion in the empire, while the same privilege was accorded to Zoroastrianism by Rome. Under his son, Yazdegerd II. (438–457), who once more revived the persecutions of the Christians and the Jews, a short conflict with Rome again ensued (441): while at the same time war prevailed in the east against the remnants of the Kushan Empire and the tribe of Kidarites, also named Huns.

Bahram V., Gor.

Here a new foe soon arose in the shape of the Ephthalites (*Haitab*), also known as the "White Huns," a barbaric tribe which shortly after A.D. 450 raided Bactria and terminated the Kushana dominion (Procop. *Pers.* i. 3). These Ephthalite attacks harassed and weakened the Sassanids, exactly as the Tocharians had harassed and weakened the Arsacids after Phraates II. Peroz (457–484) fell in battle against them; his treasures and family were captured and the country devastated far and near. His brother Balash (484–488), being unable to repel them, was deposed and blinded, and the crown was bestowed on Kavadh I. (488–531), the son of Peroz. As the external and internal distress still continued he was dethroned and imprisoned, but took refuge among the Ephthalites and was restored in 499 by their assistance—like so many Arsacids by the arms of the Dahae and Sacae. To these struggles obviously must be attributed mainly the fact that in the whole of this period no Roman war broke out. But, at the same time, the religious duel had lost in intensity, since, among the Persian Christians, the Nestorian doctrine was now dominant. Peroz had already favoured the diffusion of Nestorianism, and in 483 it was officially adopted by a synod, after which it remained the Christian Church of the Persian Empire, its head being the patriarch of Seleucia—Ctesiphon.

The Ephthalites or White Huns.

Kavadh I.

Kavadh proved himself a vigorous ruler. On his return he restored order in the interior. In 502 he attacked the Romans and captured and destroyed Amida (mod. Diarbekr), but was compelled to ratify a peace owing to an inroad of the Huns. Toward the close of his reign (527) he resumed the war, defeating Belisarius at Callinicum (531), with the zealous support of the wild Arab Mondhir II. of Hira. On his death his son Chosroes I. concluded a peace with Justinian (532), pledging the Romans to an annual subsidy for the maintenance of the Caucasus fortresses. In his home policy Kavadh is reminiscent of Yazdegerd I. Like him he had little inclination to the orthodox church, and favoured Mazdak, the founder of a communistic sect which had made headway among the people and might be used as a weapon against the nobles, of whom Mazdak demanded that they should cut down their luxury and distribute their superfluous wealth. Another feature of his programme was the community of wives. The crown-prince, Chosroes, was, on the other hand, wholly orthodox; and, towards the close of his father's reign, in conjunction with the chief Magian, he carried through a sacrifice of the Mazdakites, who were butchered in a great massacre (528). Chosroes I. (531–579), surnamed Anushirvan ("the blessed"), then restored the orthodox doctrine in full, publishing his decision in a religious edict. At the same time he produced the official exposition of the *Avesta*, an exegetical translation in the popular tongue (Pahlavi), and declared its contents binding. Defection from Zoroastrianism was punished with death, and therefore also the proselytizing of the Christians, though the Syrian martyrologies prove that the kings frequently ignored these proceedings so long as it was at all possible to do so.

The Mazdakite Sect.

Chosroes I., Anushirvan.

Chosroes I. was one of the most illustrious sovereigns of the Sassanian Empire. From him dates a new and equitable adjustment of the imperial taxation, which was later adopted by the Arabs. His reputation as an enlightened ruler stood so high that when Justinian, in 529, closed the school of Athens, the last Neoplatonists bent their steps to him in hopes of finding in him the true philosopher-king. Their disillusionment, indeed, was speedy and complete, and their gratitude was great, when, by the conditions of the armistice of 549, he allowed their return. From 540 onward he conducted a great war against Justinian (527–565), which, though interrupted by several armistices, lasted till the fifty years' peace of 562. The net result, indeed, was merely to restore the *status quo*; but during the campaign Chosroes sacked Antioch and transplanted the population to a new quarter of Ctesiphon (540). He also extended his power to the Black Sea and the Caucasus; on the other hand, a siege of Edessa failed (544). A second war broke out in 577, chiefly on the question of Armenia and the Caucasus territory. In this Chosroes ravaged Cappadocia in 575; but the campaign in Mesopotamia was unsuccessful. In the interval between these two struggles (570) he despatched assistance to the Arabs of Yemen, who had been assailed and subdued by the Abyssinian Christians; after which period Yemen remained nominally under Persian suzerainty till its fate was sealed by the conquests of Mahomet and Islam.

Meanwhile, about A.D. 560, a new nation had sprung up in the East, the Turks. Chosroes concluded an alliance with them against the Ephthalites and so conquered Bactria south of the Oxus, with its capital Balkh. Thus this province, which, since the insurrection of Diodotus in 250 B.C., had undergone entirely different vicissitudes from the rest of Iran, was once more united to an Iranian Empire, and the Sassanid dominions, for the first time, passed the frontiers of the Arsacids. This, however, was the limit of their expansion. Neither the territories north of the Oxus, nor eastern Afghanistan and the Indus provinces, were ever subject to them. That the alliance with the Turks should soon change to hostility and mutual attack was inevitable from the nature of the case; in the second Roman war the Turkish Khan was leagued with Rome.

First Appearance of the Turks. Sassanid Conquest of Bactria.

Chosroes bequeathed this war to his son Hormizd IV. (579–590), who, in spite of repeated negotiations, failed to re-establish peace. Hormizd had not the ability to retain the authority of his father, and he further affronted the Magian priesthood by declining to proceed against the Christians and by requiring that, in his empire, both religions should dwell together in peace. Eventually he succumbed to a conspiracy of his magnates, at whose head stood the general Bahram Cobin, who had defeated the Turks, but afterwards was beaten by the Romans. Hormizd's son, Chosroes II., was set up against his father and forced to acquiesce in his execution. But immediately new risings broke out, in which Bahram Cobin—though not of the royal line—attempted to secure the crown, while simultaneously a Prince Bistam entered the lists. Chosroes fled to the Romans and the emperor Maurice undertook his restoration at the head of a great army. The people flocked to his standard; Bahram Cobin was routed (591) and fled to the Turks, who slew him, and Chosroes once more ascended the throne of Ctesiphon; Bistam held out in Media till 596. Maurice made no attempt to turn the opportunity to Roman advantage, and in the peace then concluded he even abandoned Nisibis to the Persians.

Chosroes II.

Chosroes II. (590–628) is distinguished by the surname of *Parvez* ("the conqueror"), though, in point of fact, he was immeasurably inferior to a powerful sovereign like his grandfather, or even to a competent general. He lived, however, to witness unparalleled vicissitudes of fortune. The assassination

of Maurice in 602 impelled him to a war of revenge against Rome, in the course of which his armies—in 608 and, again, in 615 and 626—penetrated as far as Chalcedon opposite Constantinople, ravaged Syria, reduced Antioch (611), Damascus (613), and Jerusalem (614), and carried off the holy cross to Ctesiphon; in 619 Egypt was occupied. Meanwhile, the Roman Empire was at the lowest ebb. The great emperor Heraclius, who assumed the crown in 610, took years to create the nucleus of a new military power. This done, however, he took the field in 623, and repaid the Persians with interest. Their armies were everywhere defeated. In 624 he penetrated into Atropatene (Azerbaijan), and there destroyed the great fire-temple; in 627 he advanced into the Tigris provinces. Chosroes attempted no resistance, but fled from his residence at Dastagerd to Ctesiphon. These proceedings, in conjunction with the avarice and licence of the king, led to revolution. Chosroes was deposed and slain by his son Kavadh II. (628); but the parricide died in a few months and absolute chaos resulted. A whole list of kings and pretenders—among them the General Shahrbaraz and Boran, a daughter of Chosroes—followed rapidly on one another; till finally the magnates united and, in 632, elevated a child to the throne, Yazdegerd III., grandson of Chosroes. In the interval—presumably during the reign of Queen Boran—peace was concluded with Heraclius, the old frontier being apparently restored. The cross had already been given back to the emperor.

The Arab Conquest.

Thus the hundred years' struggle between Rome and Persia, which had begun in 527 with the attack of the first Kavadh on Justinian, had run its fruitless course, utterly enfeebling both empires and consuming their powers. So it was that room was given to a new enemy who now arose between either state and either religion—the Arabs and Islam. In the same year that saw the coronation of Yazdegerd III.—the beginning of 633—the first Arab squadrons made their entry into Persian territory. After several encounters there ensued (637) the battle of Kadisiya (Qadisiya, Cadesia), fought on one of the Euphrates canals, where the fate of the Sassanian Empire was decided. A little previously, in the August of 636, Syria had fallen in a battle on the Yarmuk (Hieromax), and in 639 the Arabs penetrated into Egypt. The field of Kadisiya laid Ctesiphon, with all its treasures, at the mercy of the victor. The king fled to Media, where his generals attempted to organize the resistance; but the battle of Nehavend (? 641) decided matters there. Yazdegerd sought refuge in one province after the other, till, at last, in 651, he was assassinated in Merv (see CALIPHATE: § A, § 1).

Thus ended the empire of the Sassanids, no less precipitately and ingloriously than that of the Achaemenids. By 650 the Arabs had occupied every province to Balkh and the Oxus. Only in the secluded districts of northern Media (Tabaristan), the "generals" of the house of Karen (Spahpat, Ispehbed) maintained themselves for a century as vassals of the caliphs—exactly as Atropates and his dynasty had done before them.

The fall of the empire sealed the fate of its religion. The Moslems officially tolerated the Zoroastrian creed, though occasional persecutions were not lacking. But little by little it vanished from Iran, with the exception of a few remnants (chiefly in the oasis of Yezd), the faithful finding a refuge in India at Bombay. These Parsees have preserved but a small part of the sacred writings; but to-day they still number their years by the era which begins on the 16th of June A.D. 632, with the accession of Yazdegerd III., the last king of their faith and the last lawful sovereign of Iran, on whom rested the god-given Royal Glory of Ormuzd.

B.—*Transition Period: from the Fall of the Sassanid Dynasty to the Death of Timur (1405).*

Alien Rulers.

With the final defeat of the Sassanids under Yazdegerd III. at the battles of Kadisiya (Kadessia) (637) and Nehavend (641), Persia ceased to exist as a single political unit. The country passed under a succession of alien rulers who cared nothing for its ancient institutions or its religion. For about 150 years it was governed, first from Medina and afterwards from Bagdad, by officers of the Mahommedan caliphs whose principal aim it was to destroy the old nationality by the suppression of its religion. The success of this policy was, however, only apparent, especially in Iran, the inhabitants of which adopted Islam only in the most superficial manner, and it was from Persia that the blow fell which destroyed the Omayyad caliphate and set up the Abbasids in its place (see CALIPHATE). Even before this event adventurers and dissatisfied Moslem officers had utilized the slumbering hostility of the Persian peoples to aid them in attacks on the caliphs (*e.g.* Ziyad, son of Abu Sofian, in the reign of Moawiya I.), and the policy of eastern expansion brought the Arab armies perpetually into the Persian provinces.

In the reign of Merwan I. the Persians (who were mostly Shi'ites) under a Moslem officer named Mokhtar (Mukhtar), whom they regarded as their mahdi, vainly attempted to assert their independence in Kufa, but were soon defeated. This rising was followed by many more (see CALIPHATE: § B) in which the caliphs were generally successful, and Abdalmalik (d. 705) considerably strengthened the Moslem power by instituting a thorough system of Moslem coins and enforcing Arabic as the official language throughout the empire. In the succeeding reign Persia was further subdued by the great conqueror Qoteiba (Qotaiba) b. Moslim, the Arabic governor of Khorasan. Omar II., however, extended to non-Arabic Moslems immunity from all taxes except the *zakat* (poor-rate), with the result that a large number of Persians, who still smarted under their defeat under Mokhtar, embraced Islam and drifted into the towns to form a nucleus of sedition under the Shi'ite preachers. In the reign of Yazid II. (720-724) serious risings took place in Khorasan, and in spite of the wise administration of his successor Hisham (d. 743), the disorder continued to spread, fanned by the Abbasids and the Shi'ite preachers. Ultimately in the reign of Merwan II. the non-Arabic Moslems found a leader in Abu Moslim, a *maula* (client) of Persian origin and a henchman of Ibrahim b. Mahommed b. Ali, the Shi'ite imam, who raised a great army, drove the caliph's general Nasr b. Sayyar into headlong flight, and finally expelled Merwan. Thus the Abbasids became masters of Persia and also of the Arab Empire. They had gained their success largely by the aid of the Persians, who began thenceforward to recover their lost sense of nationality; according to the Spanish author Ibn Hazm the Abbasids were a Persian dynasty which destroyed the old tribal system of the Arabs and ruled despotically as Chosroes had done. At the same time the Khorasanians had fought for the old Alid family, not for the Abbasids, and with the murder of Abu Moslim discontent again began to grow among the Shi'ites (*q.v.*). In the reign of Harun al-Rashid disturbances broke out in Khorasan which were temporarily appeased by a visit from Harun himself. Immediately afterwards Rafi' b. Laith, grandson of the Omayyad general Nasr b. Sayyar, revolted in Samarkand, and Harun on his way to attack him died at Tus (809). Harun's sons Amin and Mamun quarrelled over the succession; Amin became caliph, but Mamun by the aid of Tahir b. Hosain Dhu 'l-Yaminain ("the man with two right hands") and others succeeded in deposing and killing him. Tahir ultimately (820) received the governorship of Khorasan, where he succeeded in establishing

put an end to the persecutions, and allowed the Persian Christians an individual organization. In the Persian tradition he is consequently known as "the sinner." In the end he was probably assassinated. So great was the bitterness against him that the magnates would admit none of his sons to the throne. One of them, however, Bahram V., found an auxiliary in the Arab chief Mondhir, who had founded a principality in Hira, west of the lower Euphrates; and, as he pledged himself to govern otherwise than his father, he received general recognition. This pledge he redeemed, and he is, in consequence, the darling of Persian tradition, which bestows on him the title of *Gor* ("the wild ass"), and is eloquent on his adventures in the chase and in love. This reversal of policy led to a Christian persecution and a new war with Rome. Bahram, however, was worsted; and in the peace of 422 Persia agreed to allow the Christians free exercise of their religion in the empire, while the same privilege was accorded to Zoroastrianism by Rome. Under his son, Yazdegerd II. (438–457), who once more revived the persecutions of the Christians and the Jews, a short conflict with Rome again ensued (441): while at the same time war prevailed in the east against the remnants of the Kushan Empire and the tribe of Kidarites, also named Huns.

Bahram V., Gor.

Here a new foe soon arose in the shape of the Ephthalites (*Haitab*), also known as the "White Huns," a barbaric tribe which shortly after A.D. 450 raided Bactria and terminated the Kushana dominion (Procop. *Pers.* i. 3). These Ephthalite attacks harassed and weakened the Sassanids, exactly as the Tocharians had harassed and weakened the Arsacids after Phraates II. Peroz (457–484) fell in battle against them; his treasures and family were captured and the country devastated far and near. His brother Balash (484–488), being unable to repel them, was deposed and blinded, and the crown was bestowed on Kavadh I. (488–531), the son of Peroz. As the external and internal distress still continued he was dethroned and imprisoned, but took refuge among the Ephthalites and was restored in 499 by their assistance—like so many Arsacids by the arms of the Dahae and Sacae. To these struggles obviously must be attributed mainly the fact that in the whole of this period no Roman war broke out. But, at the same time, the religious duel had lost in intensity, since, among the Persian Christians, the Nestorian doctrine was now dominant. Peroz had already favoured the diffusion of Nestorianism, and in 483 it was officially adopted by a synod, after which it remained the Christian Church of the Persian Empire, its head being the patriarch of Seleucia—Ctesiphon.

The Ephthalites or White Huns.

Kavadh I.

Kavadh proved himself a vigorous ruler. On his return he restored order in the interior. In 502 he attacked the Romans and captured and destroyed Amida (mod. Diarbekr), but was compelled to ratify a peace owing to an inroad of the Huns. Toward the close of his reign (527) he resumed the war, defeating Belisarius at Callinicum (531), with the zealous support of the wild Arab Mondhir II. of Hira. On his death his son Chosroes I. concluded a peace with Justinian (532), pledging the Romans to an annual subsidy for the maintenance of the Caucasus fortresses. In his home policy Kavadh is reminiscent of Yazdegerd I. Like him he had little inclination to the orthodox church, and favoured Mazdak, the founder of a communistic sect which had made headway among the people and might be used as a weapon against the nobles, of whom Mazdak demanded that they should cut down their luxury and distribute their superfluous wealth. Another feature of his programme was the community of wives. The crown-prince, Chosroes, was, on the other hand, wholly orthodox; and, towards the close of his father's reign, in conjunction with the chief Magian, he carried through a sacrifice of the Mazdakites, who were butchered in a great massacre (528). Chosroes I. (531–579), surnamed Anushirvan ("the blessed"), then restored the orthodox doctrine in full, publishing his decision in a religious edict. At the same time he produced the official exposition of the *Avesta*, an exegetical translation in the popular tongue (Pahlavi), and declared its contents binding. Defection from Zoroastrianism was punished with death, and therefore also the proselytizing of the Christians, though the Syrian martyrologies prove that the kings frequently ignored these proceedings so long as it was at all possible to do so.

The Mazdakite Sect.

Chosroes I., Anushirvan.

Chosroes I. was one of the most illustrious sovereigns of the Sassanian Empire. From him dates a new and equitable adjustment of the imperial taxation, which was later adopted by the Arabs. His reputation as an enlightened ruler stood so high that when Justinian, in 529, closed the school of Athens, the last Neoplatonists bent their steps to him in hopes of finding in him the true philosopher-king. Their disillusionment, indeed, was speedy and complete, and their gratitude was great, when, by the conditions of the armistice of 549, he allowed their return. From 540 onward he conducted a great war against Justinian (527–565), which, though interrupted by several armistices, lasted till the fifty years' peace of 562. The net result, indeed, was merely to restore the *status quo*; but during the campaign Chosroes sacked Antioch and transplanted the population to a new quarter of Ctesiphon (540). He also extended his power to the Black Sea and the Caucasus; on the other hand, a siege of Edessa failed (544). A second war broke out in 577, chiefly on the question of Armenia and the Caucasus territory. In this Chosroes ravaged Cappadocia in 575; but the campaign in Mesopotamia was unsuccessful. In the interval between these two struggles (570) he despatched assistance to the Arabs of Yemen, who had been assailed and subdued by the Abyssinian Christians; after which period Yemen remained nominally under Persian suzerainty till its fate was sealed by the conquests of Mahomet and Islam.

Meanwhile, about A.D. 560, a new nation had sprung up in the East, the Turks. Chosroes concluded an alliance with them against the Ephthalites and so conquered Bactria south of the Oxus, with its capital Balkh. Thus this province, which, since the insurrection of Diodotus in 250 B.C., had undergone entirely different vicissitudes from the rest of Iran, was once more united to an Iranian Empire, and the Sassanid dominions, for the first time, passed the frontiers of the Arsacids. This, however, was the limit of their expansion. Neither the territories north of the Oxus, nor eastern Afghanistan and the Indus provinces, were ever subject to them. That the alliance with the Turks should soon change to hostility and mutual attack was inevitable from the nature of the case; in the second Roman war the Turkish Khan was leagued with Rome.

First Appearance of the Turks. Sassanid Conquest of Bactria.

Chosroes bequeathed this war to his son Hormizd IV. (579–590), who, in spite of repeated negotiations, failed to re-establish peace. Hormizd had not the ability to retain the authority of his father, and he further affronted the Magian priesthood by declining to proceed against the Christians and by requiring that, in his empire, both religions should dwell together in peace. Eventually he succumbed to a conspiracy of his magnates, at whose head stood the general Bahram Cobin, who had defeated the Turks, but afterwards was beaten by the Romans. Hormizd's son, Chosroes II., was set up against his father and forced to acquiesce in his execution. But immediately new risings broke out, in which Bahram Cobin—though not of the royal line—attempted to secure the crown, while simultaneously a Prince Bistam entered the lists. Chosroes fled to the Romans and the emperor Maurice undertook his restoration at the head of a great army. The people flocked to his standard; Bahram Cobin was routed (591) and fled to the Turks, who slew him, and Chosroes once more ascended the throne of Ctesiphon; Bistam held out in Media till 596. Maurice made no attempt to turn the opportunity to Roman advantage, and in the peace then concluded he even abandoned Nisibis to the Persians.

Chosroes II.

Chosroes II. (590–628) is distinguished by the surname of *Parvez* ("the conqueror"), though, in point of fact, he was immeasurably inferior to a powerful sovereign like his grandfather, or even to a competent general. He lived, however, to witness unparalleled vicissitudes of fortune. The assassination

Kermān, and Irak with Kurdistan. Sinjar himself lost all his dominions except Khorasan in wars with the Karakitai. The sultans of Kermān were rarely independent in the full sense, but they enjoyed comparative peace and prosperity till the death of Toghrul Shah (1170), after which their power fell before the Ghuzz tribes; Kermān was finally captured in 1195 by the Khwarizm shahs. Meanwhile an independent dynasty was formed about 1136 in Azerbaijan by the governors (atabegs) appointed by the Seljuks; this dynasty was overthrown by the Khwarizm shahs in 1225. Similar dynasties existed in Laristan and Fars.

The empire of the Seljuks was essentially military. Their authority over their own officers was so precarious that they preferred to entrust the command to Turkish slaves. These officers, however, were far from loyal to their lords. In every part of the empire they gradually superseded the Seljuk princes, and the minor dynasties above mentioned all owed their existence to the ambition of the Turkish regents or atabegs. The last important dynasty in Persia prior to the Mongol invasion was that of the Salgharids in Fars, founded by the descendants of a Turkish general Salaghar, who had formerly been a Turkoman leader and ultimately became chamberlain to Toghrul Beg. The first ruler was Sonkor b. Modud, who made himself independent in Fars in 1148. The fourth, Sa'd, became tributary to the Khwarizm shahs in 1195, and the fifth acknowledged allegiance to the Mongol Ogotai and received the title Kutbegh Khan. His successors were vassals of the Mongols, and the last, the Princess 'Abish (d. 1287), was the wife of Hulagu's son Mangu Timur.

Before passing on to the Mongol conquerors of Persia it is necessary briefly to notice the shahs of Khwarizm, who have frequently been mentioned as overthrowing the minor dynasties which arose with the decay of the Seljuks. These rulers were descended from Anushtajin, a Turkish slave of Ghazni, who became cupbearer to the Seljuk Malik Shah, and afterwards governor of Khwarizm (Khiva) in 1077. In 1138 the third of the line, Atsiz, revolted but was defeated and expelled by Sinjar. Shortly afterwards he returned, firmly established his power, and extended the Khwarizm Empire as far as Jand on the Sihun. The brief reigns of Il-Arslan and Sultan Shah Mahmud were succeeded by that of Tukush (1172–1199) and Ala ed-din Mahommed[1] (1199–1220). The former of these subdued Khorasan, Rai and Isfahan, while the latter brought practically all Persia under his sway, conquered Bokhara, Samarkand and Otrar, capital of the Karakitai, and had even made himself master of Ghazni when his career was stopped by the hordes of the Mongol Jenghiz Khan. In 1231 the last of his house, Jelal ud-din (Jalaluddin) Mangharti, or Mango-berti, was banished, and thus the empire of the Khwarizm shahs, which for a brief period had included practically all the lands conquered by the Seljuks, passed away.

Khwarizm.

Thus from the fall of the Samanids to the invasion of the Mongols five or at most six important dynasties held sway over Persia, while some forty small dynasties enjoyed a measure of local autonomy. During the whole of this period the Abbasid caliphs had been nominally reigning throughout the Mahommedan world with their capital at Bagdad. But with hardly any exceptions they had been the merest puppets, now in the hands of Turkish ministers, now under the protection of practically independent dynasts. The real rulers of Persia during the years 874–1231 were, as we have seen, the Samanids, the Buyids, the Ghaznevids, the Seljuks, the Salgharids and the Khwarizm shahs. We now come to a new period in Persian history, when the numerous petty dynasties which succeeded the Seljuks were all swallowed up in the great Mongol invasion.

In the later years of the 12th century the Mongols began their westward march and, after the conquest of the ancient kingdom of the Kajakitai, reached the borders of the territory of the Khwarizm shahs, which was at once overwhelmed. Jenghiz Khan died in 1272, and the Mongol Empire stretching from the Caspian to the Yellow Sea was divided up among his sons. Persia itself fell partly in the domain of Jagatai and partly in that of the Golden Horde. The actual governor of Persia was Tului or Tule, whose son Hulagu or Hulaku is the first who can be rightly regarded as the sovereign of Persia. His accession occurred in 1256, and henceforward Persia becomes after 600 years of spasmodic government a national unit. Hulagu at once proceeded to destroy a number of nascent dynasties which endeavoured to establish themselves on the ruins of the Khwarizm Empire; about 1255 he destroyed the dynasty of the Assassins[2] by the capture of their stronghold of Alamut (Eagle's Nest), and finally in 1258 captured Bagdad. The thirty-eighth and last Abbasid caliph, Mostasim, was brutally murdered, and thus the Mahommedan caliphate ceased to exist even as an emasculated pontificate. The Persian Empire under Hulagu and his descendants extended from the dominions of Jagatai on the north to that of the Egyptian dynasts on the south, and from the Byzantine Empire on the west to the confines of China. Its rulers paid a nominal homage to the Khakhan (Great Khan) in China, and officially recognized this dependence in their title of Ilkhan, *i.e.* provincial or dependent khan. From 1258 to 1335 the Ilkhans were not seriously challenged. Hulagu fixed his capital at Maragha (Meragha) in Azerbaijan, where he erected an observatory for Nasir ud-din Tusi, who at his request prepared the astronomical tables known as the *Zidj-i-Ilkhani*. He died in 1265 and was succeeded by his son Abagha or Abaka, who married the daughter of Michael Palaeologus, the Byzantine ruler. Abagha was a peaceful ruler and endeavoured by wise administration to give order and prosperity to a country torn asunder by a long period of intestine war and the Mongol invasion. He succeeded in repelling two attacks by other Mongolian princes of the house of Jenghiz Khan; otherwise his reign was uneventful. His brother Nikudar (originally Nicolas) Ahmad Khan succeeded him in 1281. This prince was converted to Islam, an event of great moment both to the internal peace and to the external relations of Persia. His persecution of the Christians led them into alliance with the Mongols, who detested Islam; the combined forces were too strong for Nikudar, who was murdered in 1284. The external results were of more importance. The Ilkhans, who had failed in their attempt to wrest Syria from the Mameluke rulers of Egypt, had subsequently endeavoured to effect their object by inducing the European Powers to make a new crusade. The conversion of Nikudar put an end to this policy and Egypt was for some time free from Persian attack (see EGYPT: *History*). The Mongol leaders put on the throne a son of Abagha, by name Arghun. His reign was troubled. His first minister Shams ud-din was suspected of having poisoned Abagha, and was soon put to death. His successor, the amir Bogha, conspired against Arghun and was executed. Under the third minister (1289–1291), a Jewish doctor named Sa'd addaula (ed-Dowleh), religious troubles arose owing to his persecution of the Mahommedans and his favouring the Christians. The financial administration of Sa'd was prudent and successful, if somewhat severe, and the revenue benefited considerably under his care. But he committed the tactical error of appointing a disproportionate number of Jews and Christians as revenue officials, and thus made many enemies among the Mongol nobles, who had him assassinated in 1291 when Arghun was lying fatally ill. It is possible that it was Sa'd's diplomacy which led Pope Nicholas IV. to send a mission to Arghun with a view to a new crusade. The reign of Arghun was also disturbed by a rebellion of a grandson of Hulagu, Baidu Khan. Arghun died soon after the murder of Sa'd, and was succeeded by his brother Kaikhatu, or Gaykhatu, who was taken prisoner by Baidu Khan and killed (1295). Baidu's reign was cut short in the same year by Arghun's son Ghazan Mahmud, whose reign (1295–1304) was a period of prosperity in war and administration. Ghazan

Mongols.

[1] It was this prince who destroyed the Ghorid dynasty, which claimed descent from the legendary Persian monarch Zohak. Except for a brief period of submission to the Ghaznevids (1009–1099) they ruled at Ghor until 1215, when they were conquered after a fierce struggle.

[2] The dynasty of the Assassins or Isma'ilites was founded in 1090 and extended its rule over much of western Persia and Syria (for the rulers see Stockvis, *op. cit.* i. 131, and article ASSASSIN).

vas a man of great ability. He established a permanent staff :o deal with legal, financial and military affairs, put on a firm)asis the monetary system and the system of weights and neasures, and perfected the mounted postal service. Ghazan ought with success against Egypt (which country had already rom 1293 to December 1294 been ruled by a Mongol usurper Kitboga), and even held Damascus for a few months. In 1303, ıowever, his troops were defeated at Merj al-Saffar, and Mongol laims on Syria were definitely abandoned. It was even uggested that the titular Abbasid caliphs (who retained an mpty title in Cairo under Mameluke protection) should be einstated at Bagdad, but this proposal was not carried into ffect. Ghazan is historically important, however, mainly as he first Mongol ruler who definitely adopted Islam with a arge number of his subjects. He died in 1304, traditionally f anger at the Syrian fiasco, and was succeeded by his brother Jljaitu (Oeljeitu). The chief events of his reign were a success-ul war against Tatar invaders and the substitution of the new ity of Sultania as capital for Tabriz, which had been Ghazan's ıeadquarters. Uljaitu was a Shi'ite and even stamped his oins with the names of the twelve Shi'ite imams. He died n 1316, and was succeeded by Abu Sa'id, his son. This prince, ınder whom a definite peace was made with Malik al-Nasir, he Mameluke ruler of Egypt, had great trouble with powerful 'iziers and generals which he accentuated by his passion for Bagdad-Khatun, wife of the amir Hosain and daughter of the mir Chupan. This lady he eventually married, with the result hat Chupan headed a revolt of his tribe, the Selduz. Abu Sa'id lied of fever in 1335, and with him the first Mongol or Ilkhan lynasty of Persia practically came to an end. The real power vas divided between Chupan and Hosain the Jelair (or Jalair), r the Ilkhanian, and their sons, known respectively as the Little Hasan (Hasan Kuchuk) and the great Hasan (Hasan Buzurg). Two puppet kings, Arpa Khan, a descendant of Hulagu's brother Arikbuhga, and Musa Khan, a descendant of Baidu, nominally reigned for a few months each. Then Hasan Kuchuk set up one Sati-beg, Abu Sa'id's daughter, and wife uccessively of Chupan, Arfa Khan and one Suleiman, the last f whom was khan from 1339 to 1343; in the same time Hasan Buzurg set up successively Mahommed, Tugha-Timur and Jahan-Timur. A sixth nonentity, Nushirwan, was a Chupani nominee ı 1344, after which time Hasan Buzurg definitely installed imself as the first khan of the Jelairid or Ilkhanian-Jelairid ynasty.

Minor dynasties.

Practically from the reign of Abu Sa'id Persia was divided nder five minor dynasties, (1) the Jelairids, (2) the Mozaffarids, (3) the Sarbadarids (Serbedarians), (4) the Beni Kurt, and (5) the Jubanians, all of which ultimately fell before the armies of Timur.

1. The Jelairid rulers were Hasan Buzurg (1336, strictly 1344–1356), Owais (1356–1374), Hosain (1374–1382), Sultan Ahmad (1382–1410), Shah Walad (1410–1411). Their capital was Bagdad, nd their dominion was increased under Hasan. Owais added Azerbaijan, Tabriz, and even Mosul and Diarbekr. Hosain fought with the Mozaffarids of Shiraz and the Black Sheep Turkomans (Kara Kuyunli) of Armenia, with the latter of whom he ultimately ntered into alliance. On his death Azerbaijan and Irak fell to is brother, Sultan Ahmad, while another brother Bayezid ruled or a few months in part of Kurdistan. It was about this time hat Timur (*q.v.*) began his great career of conquest, under which he power of the various Persian dynasties collapsed. By 1393 he ad conquered northern Persia and Armenia, Bagdad, Mesopotamia, Diarbekr and Van, and Ahmad fled to Egypt, where he was eceived by Barkuk (Barquq) the Mameluke sultan. Barkuk, who had already excited the enmity of Timur by slaying one of his nvoys, espoused Ahmad's cause, and restored him to Bagdad after Timur's return to his normal capital Samarkand. Timur retaliated nd until his death Ahmad ruled only from time to time. In 1406 Ahmad was finally restored, but almost immediately entered upon quarrel with Kara Yusuf, leader of the Black Sheep Turkomans (Kara Kuyunli), who defeated and killed him in 1410. His nephew Shah Walad reigned for a few months only and the throne was ccupied by his widow Tandu, formerly wife of Barkuk, who ruled ver Basra, Wasit and Shuster till 1416, paying allegiance to Shah Rukh, the second Timurid ruler. Walad's sons Mahmud, Owais and Mahommed, and Hosain, grandson of Sultan Ahmad, successively ccupied the throne. The last of these was killed by the Kara Kuyunli, who had established a dynasty in western Persia after Kara Yusuf's victory in 1410.

2. The Mozaffarids, who ruled roughly from 1313 to 1399 in Fars, Kormān and Kurdistan, were descended from the Amir Mozaffar, or Muzaffar, who held a post as governor under the Ilkhan ruler. His son Mobariz ud-din Mahommed, who followed him in 1313, became governor in Fars under Abu Sa'id, in Kermān in 1340, and subsequently made himself independent at Fars and Shiraz (1353) and in Isfahan (1356). In 1357 he was deposed and blinded, and though restored was exiled again and died in 1364. His descendants, except for Jelal ed-din (Jalaluddin) Shah Shuja', the patron of the poet Hafiz, were unimportant, and the dynasty was wiped out by Timur about 1392.

3. The Sarbadarids (so called from their motto *Sar-ba-dar*, "Head to the Gibbet"), descendants of Abd al-Razzak, who rebelled in Khorasan about 1337, enjoyed some measure of independence under twelve rulers till they also were destroyed by Timur (*c.* 1380).

4. The Beni Kurt (or Kart), who had governed in Khorasan from 1245, became independent in the early 14th century; they were abolished by Timur (*c.* 1383).

5. The Jubanians had some power in Azerbaijan from 1337 to 1355, when they were dethroned by the Kipchaks of the house of Jenghiz Khan.

The authority of Timur, which, as we have seen, was dominant throughout Persia from at least as early as 1395 till his death in 1405, was never unchallenged. He passed from one victory to another, but the conquered districts were never really settled under his administration. Fresh risings of the defeated dynasties followed each new enterprise, and he had also to deal with the Mongol hordes whose territory marched with northern Persia. His descendants were for a brief period the overlords of Persia, but after Shah Rukh (reigned 1409–1446) and Ala addaula (1447), the so-called Timurid dynasty ceased to have any authority over Persia. There were Timurid governors of Fars under Shah Rukh, Pir Mahommed (1405-1409), Iskendar (1409–1414), Ibrahim (1415–1434) and Abdallah (1434); in other parts of Persia many of the Timurid family held governorships of greater or less importance.

AUTHORITIES.—The works relating to Persia will be found under articles on the main dynasties (CALIPHATE; SELJUKS, MONGOLS), and the great rulers (JENGHIZ KHAN; MAHMUD OF GHAZNI; TIMOR). For general information and chronology see S. Lane Poole, *Mohammedan Dynasties* (London, 1894); Stockvis, *Manuel d'histoire*, vol. i. (Leiden, 1888); Sir H. Howorth, *History of the Mongols* (1876-1888). (J. M. M.)

C.—*From the Death of Timur to the Fall of the Safawid Dynasty, 1405–1736.*

The Timurides and the Turkomans, 1405-1499.

Timur died in 1405, when in the seventieth year of his age and about to invade China. Besides exercising sovereignty over Transoxiana and those vast regions more or less absorbed in Asiatic Russia of the 19th century, inclusive of the Caucasus, Astrakhan and the lower Volga, and overrunning Mesopotamia, Syria, Asia Minor, Afghanistan and India, he had at this time left his indelible mark upon the chief cities and provinces of Persia. Khorasan and Mazandaran had submitted to him in 1381, Azerbaijan had shortly after followed their example, and Isfahan was seized in 1387. From Isfahan he passed on to Shiraz, and thence returned in triumph to his own capital of Samarkand. Five years later he subdued Mazandaran, and later still he was again at Shiraz, having effected the subjugation of Luristan and other provinces in the west. It may be said that from north to south, or from Astarabad to Hormuz, the whole country had been brought within his dominion.

The third son of Timur, Miran Shah, had ruled over part of Persia in his father's lifetime; but he was said to be insane, and his incapacity for government had caused the loss of Bagdad and revolt in other provinces. His claim to succession had been put aside by Timur in favour of Pir Mahommed, the son of a deceased son, but Khalil Shah, a son of the discarded prince, won the day. His waste of time and treasure upon a fascinating mistress named Shadu 'l-Mulk, the "delight of the kingdom," soon brought about his deposition, and in 1408 he gave way to Shah Rukh, who, with the exception of Miran Shah, was the only surviving son of Timur. In fact, the uncle and nephew changed places—the one quitting his government of Khorasan

to take possession of the Central-Asian throne, the other consenting to become governor of the vacated Persian province and abandon the cares of the empire at Samarkand. In 1409 Khalil Shah died; and the story goes that Shadu 'l-Mulk stabbed herself and was buried with her royal lover at Rai, one of the towns which his grandfather had partly destroyed.

Shah Rukh, the fourth son of Timur, reigned for thirty-eight years, and appears to have been a brave, generous, and enlightened monarch. He removed his capital from Samarkand to Herat, of which place he rebuilt the citadel, restoring and improving the town. Merv also profited from his attention to its material interests. Sir John Malcolm speaks of the splendour of his court and of his encouragement of science and learning. He sent an embassy to China; and an English version of the travels to India of one of his emissaries, Abd ur-Razzak, is to be found in R. H. Major's *India in the Fifteenth Century* (London, Hakluyt Society, 1857). As regards his Persian possessions, he had some trouble in the north-west, where the Turkomans of Asia Minor, known as the Kara Kuyun,[1] or "Black Sheep," led by Kara Yusuf [2] and his sons Iskandar and Jahan Shah, had advanced upon Tabriz, the capital of Azerbaijan. On the death of the Shah Rukh in 1446 he was succeeded by his son Ulugh Bey, whose scientific tastes are demonstrated in the astronomical tables bearing his name, quoted by European writers when determining the latitude of places in Persia. He was, moreover, himself a poet and patron of literature, and built a college as well as an observatory at Samarkand. There is no evidence to show that he did much to consolidate his grandfather's conquests south of the Caspian. Ulugh Bey was put to death by his son Abd ul-Latif, who, six months later, was slain by his own soldiers. Babar—not the illustrious founder of the Mughal dynasty in India, but an elder member of the same house—next obtained possession of the sovereign power, and established himself in the government of Khorasan and the neighbouring countries. He died after a short rule, from habitual intemperance. After him Abu Sa'id, grandson of Miran Shah, and once governor of Fars, became a candidate for empire, and allied himself with the Uzbeg Tatars, seized Bokhara, entered Khorasan, and waged war upon the Turkoman tribe aforesaid, which, since the invasion of Azerbaijan, had, under Jahan Shah, overrun Irak, Fars and Kermān, and pillaged Herat. But he was eventually taken prisoner by Uzun Ḥasan, and killed in 1468.

It is difficult to assign dates to a few events recorded in Persian history for the eighteen years following the death of Abd ul-Latif; and, were it not for chance European missions, the same difficulty would be felt in dealing with the period after the death of Abu Sa'id up to the accession of Isma'il Sufi in 1499. Sultan Ahmad, eldest son of Abu Sa'id, reigned in Bokhara; his brother, Omar Sheikh, in Ferghana; but the son of the latter, the great Babar, was driven by the Uzbegs to Kabul and India. More to the purpose is it that Sultan Ḥosain Mirza, great-grandson of Omar Sheikh, son of Timur, reigned in Herat from 1487 to 1506. He was a patron of learned men, among others of the historians Mirkhond and Khwadamir, and the poets Jami and Hatifi. But at no time could his control have extended over central and western Persia. The nearest approach to a sovereignty in those parts on the death of Abu Sa'id is that of Uzun Ḥasan, the leader of the Ak Kuyun, or "White Sheep" Turkomans, and conqueror of the "Black Sheep," whose chief, Jahan Shah, he defeated and slew. Between the two tribes there had long been a deadly feud. Both were composed of settlers in Asia Minor, the "Black Sheep" having consolidated their power at Van, the "White" at Diarbekr.

Hosain Mirza.

Uzun Hasan.

Sir John Malcolm states that at the death of Abu Sa'id, Sultan Ḥosain Mirza "made himself master of the empire," and, a little later, that "Uzun Ḥasan, after he had made himself master of Persia, turned his arms in the direction of Turkey"; but the reader is left to infer for himself what the real "empire" of Ḥosain Mirza, and what the limit of the "Persia" of Uzun Ḥasan. The second could not well be included in the first, because the Turkomans were in possession of the greater part of the Persian plateau, while the "sultan" was in Herat, to which Khorasan belonged. It may be assumed that an empire like that acquired by Timur could not long be maintained by his descendants in its integrity.

The Turkish adjective *uzun*, اوزون "long," applied to Ḥasan, the Turkoman monarch of Persia (called also by the Arabs Ḥasanu 't-Tawil), is precisely the qualifying Persian word دراز used in the compound designation of Artaxerxes Longimanus; and Malcolm quotes the statement of a Venetian envoy in evidence that Uzun Ḥasan was "a tall thin man, of a very open and engaging countenance." This reference, and a further notice in Markham's history, supply the clue to a store of valuable information made available by the publications of the Hakluyt Society. The narratives of Caterino Zeno, Barbaro and Contarini, envoys from Venice to the court of Uzun Ḥasan, are in this respect especially interesting. Zeno was sent in 1471 to incite this warlike ruler against the Ottoman sultan, and succeeded in his mission. That the result was disastrous to the shah is not surprising, but the war seems to hold a comparatively unimportant place in the annals of Turkey.

Uzun Ḥasan had married Despina (Gr. Δέσποινα), daughter of the emperor of Trebizond, Calo Johannes of the house of the Comneni; and Zeno's wife was niece to this Christian princess. The relationship naturally strengthened the envoy's position at the court, and he was permitted to visit the queen in the name of the republic which he represented. Barbaro and Contarini met at Isfahan in 1474, and there paid their respects to the shah together. Kum and Tauris or Tabriz (then the capital) were also visited by the Italian envoys following in the royal suite; and the incidental notice of these cities, added to Contarini's formal statement that "the extensive country of Ussuncassan [*sic*] is bounded by the Ottoman Empire and by Caramania," and that Siras (Shiraz) is comprehended in it, proves that at least Azerbaijan, Irak, and the main part of the provinces to the south, inclusive of Fars, were within the dominions of the reigning monarch.

There is good reason to suppose that Jahan Shah, the Black Sheep Turkoman, before his defeat by Uzun Ḥasan, had set up the standard of royalty; and Zeno, at the outset of his travels, calls him "king of Persia" [3] in 1450. Chardin alludes to him in the same sense; but Ḥasan the Long is a far more prominent figure, and has hardly received justice at the hands of the historian. Indeed, his identity seems to have been lost in the various modes of spelling his name adopted by the older chroniclers, who call him indiscriminately [4] Alymbeius, Asembeius, Asembec, Assimbeo, or Ussan Cassano. He is said to have earned the character of a wise and valiant monarch, to have reigned eleven years, to have lived to the age of seventy, and, on his death in 1477 or (according to Krusinski and Zeno) 1478, to have been succeeded on the throne of Persia by his son Ya'qub. This prince, who had slain an elder brother, died by poison (1485), after a reign of seven years. The dose was offered to him by his wife, who had been unfaithful to him and sought to set her paramour on his throne.

Writers differ as to the succession to Ya'qub. Zeno's account is that a son named Allamur (called also, Alamut, Alvante, El-wand and Alwung Bey) was the next king, who, besides Persia, possessed Diarbekr and part of greater Armenia near the Euphrates. On the other hand, Krusinski states that, Ya'qub dying childless, his relative Julaver, one of the grandees of the kingdom, seized the throne, and held possession of it for three years. Baisingar, it is added, succeeded him in 1488 and reigned till 1490, when a young nobleman named Rustan (Rustam?) obtained the sovereign power and exercised it for seven years. This account is confirmed by

Anarchy.

[1] They were commonly called Kara Kuyun-lu and the "White Sheep" Turkomans Ak Kuyun-lu, the affix "lu" signifying possession, *i.e.* possession of a standard bearing the image of a black or white sheep.

[2] According to Erskine, this chief killed Miran Shah, whose dwelling-place was Tabriz.

[3] See also Ramusio's preface.

[4] Knolles, Purchas, Zeno.

Angiolello, a traveller who followed his countrymen Barbaro and Contarini to Persia; and from the two authorities combined may be gathered the further narration of the murder of Rustam and usurpation of the throne by a certain Ahmad, whose death, under torture, six months afterwards, made way for Alamut, the young son of Ḥasan. These discrepancies can be reconciled on reference to yet another record bound up with the narratives of the four Italians aforesaid, and of much the same period. In the *Travels of a Merchant in Persia* the story of Ya'qub's death is supplemented by the statement that "the great lords, hearing of their king's decease, had quarrels among themselves, so that for five or six years all Persia was in a state of civil war, first one and then another of the nobles becoming sultans. At last a youth named Alamut, aged fourteen years, was raised to the throne, which he held till the succession of Sheikh Isma'il." Who this young man was is not specified; but other writers call Alamut and his brother Murad the sons of Ya'qub, as though the relationship were unquestionable.

Now little is known, save incidentally, of Julaver or Rustam; but Baisingar is the name of a nephew of Omar Sheikh, king of Ferghana and contemporary of Uzun Ḥasan. There was no doubt much anarchy and confusion in the interval between the death of Ya'qub and the restoration, for two years, of the dynasty of the White Sheep. But the tender age of Alamut would, even in civilized countries, have necessitated a regency; and it may be assumed that he was the next legitimate and more generally recognized sovereign. Markham, in designating this prince the last of his house, states that he was dethroned by the renowned founder of the Safawi dynasty. This event brings us to one of the most interesting periods of Persian history, any account of which must be defective without a prefatory sketch of Isma'il Sufi.

The Sufi or Safawid (*Safawi*) *Dynasty* (*1499-1736*).—Sheikh Saifu 'd-Din Izhak[1]—lineally descended from Musa, the seventh imam—was a resident at Ardebil (Ardabil) south-west of the Caspian, some time during the 14th century. It is said that his reputation for sanctity attracted the attention of Timur, who sought him out in his abode, and was so charmed by the visit that he released, at the holy man's request, a number of captives of Turkish origin, or Georgians, taken in the wars with Bayezid. The act ensured to the Sheikh the constant devotion and gratitude of these men—a feeling which was loyally maintained by their descendants for the members of his family in successive generations.

Sheikh Saifu 'd-Din.

His son Sadru'd-Din and grandson Kwaja 'Ali (who visited Mecca and died at Jerusalem) retained the high reputation of their pious predecessor. Junaid, a grandson of the last, married a sister of Uzun Ḥasan, and by her had a son named Sheikh Haidar, who married his cousin Martha, daughter of Uzun Ḥasan and Queen Despina. Three sons were the issue of this marriage, Sultan 'Ali, Ibrahim Mirza, and the youngest, Isma'il, the date of whose birth is put down as 1480 for reasons which will appear hereafter. So great was the influence of Sheikh Haidar, and so earnestly did he carry out the principles of conduct which had characterized his family for five generations, that his name has become, as it were, inseparable from the dynasty of his son Isma'il; and the term "Haidari" (leonine) is applied by many persons to indicate generally the Safawids of Persia. The outcome of his teaching was a division of Mahommedanism vitally momentous to the world of Islam. The Persian mind was peculiarly adapted to receive the form of religion prepared for it by the philosophers of Ardebil. The doctrines presented were dreamy and mystic; they rejected the infallibility of human wisdom, and threw suspicion on the order and arrangement of human orthodoxy. There was free scope given for the indulgence of that political imagination which revels in revolution and chafes at prescriptive bondage. As Malcolm remarks, "the very essence of Sufi-ism is poetry."

Sheikh Haidar.

[1] According to Langlès, the annotator of Chardin, his real designation was Abu 'l-Fath Izhak, the Sheikh Saifu 'l-Hakk wu 'd-Din or "pure one of truth and religion."

Those authorities who maintain that Ya'qub Shah left no son to succeed him consider valid the claim to the vacant throne of Sheikh Haidar Sufi. Purchas says that Ya'qub himself, "jealous of the multitude of Aidar's disciples and the greatness of his fame, caused him to be secretly murthered"; but Krusinski attributes the act to Rustam a few years later. Zeno, the anonymous merchant and Angiolello affirm that the devotee was defeated and killed in battle—the first making his conqueror to be Alamut, the second a general of Alamut's, and the third an officer sent by Rustam named Suleiman Bey. Malcolm, following the *Zubdatu 't-tawarikh*, relates that Sheikh Haidar was vanquished and slain by the governor of Shirvan. The subsequent statement that his son, Sultan 'Ali, was seized, in company with two younger brothers, by Ya'qub, "one of the descendants of their grandfather Uzun Hasan, who, *jealous of the numerous disciples that resorted to Ardebil*, confined them to the hill fort of Istakhr in Fars," seems to indicate a second interpretation of the passage just extracted from Purchas, and that there is confusion of persons and incident somewhere. One of the sons here alluded to was Isma'il, whom Malcolm makes to have been only seven years of age when he fled to Gilan in 1492. Zeno states that he was then thirteen, which is much more probable,[2] and the several data available for reference are in favour of this supposition.

The life of the young Sufi from this period to his assumption of royalty in 1499 was full of stirring adventure; and his career as Isma'il I. was a brilliant one. According to Zeno, who seems to have carefully recorded the events of the time, he left his temporary home on an island of Lake Van before he was eighteen, and, passing into Karabakh,[3] between the Aras and Kur, turned in a south-easterly direction into Gilan. Here he was enabled, through the assistance of a friend of his father, to raise a small force with which to take possession of Baku on the Caspian, and thence to march upon Shemakha in Shirvan, a town abandoned to him without a struggle. Hearing, however, that Alamut was advancing to meet him, he was compelled to seek new levies from among the Jengian Christians and others. At the head of 16,000 men, he thoroughly routed his opponents, and, having cleared the way before him, marched straight upon Tabriz, which at once surrendered. He was soon after proclaimed shah of Persia (1499), under the designation which marked the family school of thought.

Isma'il I.

Alamut had taken refuge at Diarbekr; but his brother Murad, at the head of an army strengthened by Turkish auxiliaries, was still in the field with the object of contesting the paternal crown. Isma'il lost no time in moving against him, and won a new victory on the plains of Tabriz. Murad fled with a small remnant of his soldiers to Diarbekr, the rallying-point of the White Sheep Turkomans. Zeno states that in the following year Isma'il entered upon a new campaign in Kurdistan and Asia Minor, but that he returned to Tabriz without accomplishing his object, having been harassed by the tactics of Ala ud-Daula, a beylerbey, or governor in Armenia and parts of Syria. Another writer says that he marched against Murad Khan in Irak-i-Ajami and Shiraz. This last account is extremely probable, and would show that the young Turkoman had wished to make one grand effort to save Isfahan and Shiraz (with Kazvin and the neighbouring country), these being, after the capital Tabriz, the most important cities of Uzun Ḥasan's Persia. His men, however, apparently dismayed at the growing prestige of the enemy, did not support him, and he was defeated and probably slain. There is similar evidence of the death of Alamut, who, it is alleged, was treacherously handed over to be killed by the shah's own hands.

Isma'il returned again to Tabriz (1501) "and caused great rejoicings to be made on account of his victory." In 1503 he had added to his conquests Bagdad, Mosul and Jezira on the Tigris. The next year he was called to the province of

[2] So thinks the editor and annotator of the Italian *Travels in Persia*, Charles Grey.

[3] Possibly Kara-dagh, as being the more direct road.

Gilan to chastise a refractory ruler. Having accomplished his end, he came back to his capital and remained there in comparative quiet till 1507.[1] Malcolm's dates are somewhat at variance with the above, for he infers that Bagdad was subdued in that particular year; but the facts remain. All writers seem to agree that in 1508 the king's attention was drawn to an invasion of Khorasan by Shaibani, or Shahi Beg, the Uzbeg, a descendant of Jenghiz and the most formidable opponent of Babar, from whom he had, seven years before, wrested the city of Samarkand, and whom he had driven from Turkestan to Kabul. Since these exploits he had obtained great successes in Tashkent, Ferghana, Hissar, Kunduz, and Khwarizm (Kharezm), and, at the time referred to, had left Samarkand intent upon mischief south and west of the Oxus, had passed the Murghab, and had reached Sarakhs (Serrakhs). Isma'il encamped on this occasion at Isfahan, and there concentrated the bulk of his army—strengthening his northern (and probably north-eastern) frontier with large bodies of cavalry, but maintaining an attitude of simple watchfulness. In 1510, when Shaibani had invaded Khorasan the second time, and had ravaged the Persian province of Kermān, Shah Isma'il asked for redress, referring to the land encroached on as "hereditary"; and Shaibani replied that he did not understand on what was founded the claim "to inherit." Eventually the Persian troops were put in movement, and the Uzbegs, having been divided into small detachments scattered over the country, fell back and retreated to Herat. Their leader repaired to Merv, but Isma'il quickly followed him and enticed him out to battle by taunt and reproach. Shaibani was defeated and fled, but was overtaken in his flight, and put to the sword, together with numerous relatives and companions.

Contest with Shaibani.

The next remarkable event in Isma'il's reign is his war with Sultan Selim I. Its origin may be traced to the Ottoman emperor's hatred and persecution of all heretical Moslems in his dominions, and the shah's anger at the fanaticism which had urged him to the slaughter of 40,000 Turks suspected to have thrown off the orthodox Sunnite doctrines. The sultan's army advanced into Azerbaijan and western Persia through Tokat and Erzingan. Isma'il had at this time the greater number of his soldiers employed in his newly-conquered province of Khorasan and was driven to raise new levies in Kurdistan to obtain a sufficient force to resist the invasion. It is asserted by some that his frontier then extended westward to Sivas, a city situated in a large high plain watered by the Kizil Irmak, and that hence to Khoi, 90 m. west of Tabriz, he followed the approved and often successful tactics of ravaging and retreating, so as to deprive his advancing enemy of supplies. There is good evidence to show that the Turkish janissaries were within an ace of open revolt, and that but for extraordinary firmness in dealing with them they would have abandoned their leader in his intended march upon Tabriz. In fine, at or near Khoi, the frontier-town of Azerbaijan, the battle (1514) was fought between the two rival monarchs, ending in the defeat of the Persians and the triumphant entry of Selim into their capital.

War with Selim.

There are stirring accounts of that action and of the gallant deeds performed by Selim and Isma'il, both personally engaged in it, as well as by their generals.[2] Others maintain that Isma'il was not present at all.[3] It is tolerably certain that the Turks won the day by better organization, superiority of numbers, and more especially the use of artillery. On the side of the Persians the force consisted of little more than cavalry.

[1] Angiolello.

[2] Knolles, Malcolm, Creasy, Markham, &c.

[3] Zeno. Angiolello says that "the Sophi monarch had left for Tauris [Tabriz] in order to assemble more troops." Krusinski infers much to the same effect, for he notes that "Selim came in person and took Tauris from Ismail, but *at the noise of his approach* was obliged to retreat with precipitation." The battle must thus have been fought and the victory gained when the shah was himself absent. Yet Markham quotes a journal which thus records his feats of prowess: "It was in vain that the brave Shah, with a blow of his sabre, severed a chain with which the Turkish guns were fastened together to resist the shock of the Persian cavalry."

Selim remained at Tabriz no more than eight days. Levying a contribution at that city of a large number of its skilled artisans whom he sent off to Constantinople, he marched thence towards Karabagh with intent to fix his winter quarters in those parts and newly invade Persia in the spring, but the insubordination of his troops rendered necessary his speedy return to Turkey. His expedition, if not very glorious, had not been unproductive of visible fruits. Besides humbling the power of an arrogant enemy, he had conquered and annexed to his dominions the provinces of Diarbekr and Kurdistan.[4]

From 1514 to 1524, although the hostile feeling between the two countries was very strong, there was no serious nor open warfare. Selim's attention was diverted from Persia to Egypt; Isma'il took advantage of the sultan's death in 1519 to overrun and subdue unfortunate Georgia, as Jahan Shah of the "Black Sheep" had done before him; but Suleiman, who succeeded Selim, was too strong to admit of retaliatory invasion being carried out with impunity at the cost of Turkey.

In 1524 Isma'il died[5] at Ardebil when on a pilgrimage to the tomb of his father. "The Persians dwell with rapture on his character," writes Sir John Malcolm, for they deem him "not only the founder of a great dynasty, but the person to whom that faith in which they glory owes its establishment as a national religion." And he quotes a note handed down by Purchas from a contemporary European traveller which reports of him thus: "His subjects deemed him a saint, and made use of his name in their prayers. Many disdained to wear armour when they fought under Isma'il; and so enthusiastic were his soldiers in their new faith that they used to bare their breasts to their enemies and court death, exclaiming 'Shiah! Shiah!' to mark the holy cause for which they fought."

Isma'il's Character.

Shah Ṭahmasp,[6] the eldest of the four sons of Isma'il, succeeded to the throne on the death of his father.[7] The principal occurrences in his reign, placed as nearly as possible in chronological order, were a renewal of war with the Uzbegs, who had again invaded Khorasan, and the overthrow of their army (1527); the recovery of Bagdad from a Kurdish usurper (1528); the settlement of an internal feud between Kizil-bash tribes (Shamlu and Tukulu), contending for the custody of the royal person, by the slaughter of the more unruly of the disputants (1529); the rescue of Khorasan from a fresh irruption, and of Herat from a besieging army of Uzbegs (1530); a new invasion of the Ottomans, from which Persia was saved rather by the severity of her climate than by the prowess of her warriors (1533); the wresting of Bagdad from Persia by the sultan Suleiman (1534); the king's youngest brother's rebellion

Shah Ṭahmasp.

[4] It was about this time that Persia again entered into direct relations with one of the states of western Europe. In 1510 and 1514 Alphonso d'Albuquerque, the governor of Portuguese India, sent envoys to Isma'il, seeking an alliance. In 1515, after occupying Hormuz, he despatched a third embassy under Fernão Gomes de Lemos. His object was to utilize the Shi'ite armies in conjunction with the Portuguese fleet for an attack upon the Sunnite powers—Egypt and Turkey—which were then at war with Portugal in the East. See, for further details and authorities, K. G. Jayne, *Vasco da Gama and his Successors*, pp. 108–110 and App. A. (London, 1910).—Ed.

[5] Malcolm says 1523, Krusinski 1525; Angiolello heard of his death at Cairo in August 1524. Krusinski adds that he was forty-five years of age.

[6] Angiolello calls him "Shiacthemes." As an instance of the absurd transliterating current in France as in England the word "Ach-tacon" may be mentioned. It is explained in Chardin's text to mean "les hôpitaux à Tauris: c'est-à-dire *lieux ou l'on fait profusion de vivres.*" Chardin's editor remarks, "La dernière partie de ce mot est méconnaissable, et je ne puis deviner quel mot Persan signifiant profusion a pu donner naissance à la corruption qu'on voit ici." In other words, the first syllable "ach" (Anglice *ash*) was understood in its common acceptance for "food" or "victuals"; but "tacon" was naturally a puzzler. The solution of the whole difficulty is, however, to be found in the Turco-Persian خسته خانه *khastah khanah*, pronounced by Turks *hasta hona*, or more vulgarly *asta khon* and even to a French ear *ash-tacon*, a hospital, literally a sick-house. This word is undoubtedly current at Tabriz and throughout northern Persia.

[7] The other brothers were Ilkhas, Bahram and Sam Mirza, each having had his particular appanage assigned him.

and the actual seizure of Herat, necessitating the recovery of that city and a march to Kandahar (1536); the temporary loss of Kandahar in the following year (1537), when the governor ceded it to Prince Kamran, son of Babar; the hospitable reception accorded to the Indian emperor Humayun (1543); the rebellion of the shah's brother next in age, Ilkhas, who, by his alliance with the sultan, brought on a war with Turkey (1548);[1] and finally a fresh expedition to Georgia, followed by a revengeful incursion which resulted in the enforced bondage of thousands of the inhabitants (1552).

War with Turkey.

Bayezid, a son of the Turkish emperor, rebelled, and his army was beaten in 1559 by the imperial troops at Konia in Asia Minor. He fled to Persia and took refuge with Shah Ṭahmasp, who pledged himself to give him a permanent asylum. Suleiman's demand, however, for extradition or execution was too peremptory for refusal, and the prince was delivered up to the messengers sent to take him. Whatever the motive, the act itself was highly appreciated by Suleiman, and became the means of cementing a recently concluded peace between the two monarchs. Perhaps the domestic affliction of the emperor and the anarchy which in his later years had spread in his dominions had, however, more to do with the maintenance of tranquillity than any mere personal feeling. At this time not only was there religious fanaticism at work to stir up the mutual hatred ever existing between Sunni and Shi'ah, but the intrigue of European courts was probably directed towards the maintenance of an hostility which deterred the sultan from aggressive operations north and west of Constantinople. " 'Tis only the Persian stands between us and ruin " is the reported saying of Busbecq, ambassador at Suleiman's court on the part of Ferdinand of Austria; " the Turk would fain be upon us, but he keeps him back."

In 1561 Anthony Jenkinson arrived in Persia with a letter from Queen Elizabeth to the shah. He was to treat with his majesty of " Trafique and Commerce for our English Marchants,"[2] but his reception was not encouraging, and led to no result of importance.

Tahmasp's Death.

Ṭahmasp died in 1576, after a reign of about fifty-two years. He must have been some sixty-six years of age, having come to the throne at fourteen. Writers describe him as a robust man, of middle stature, wide-lipped, and of tawny complexion. He was not wanting in soldierly qualities; but his virtues were rather negative than decided. The deceased shah had a numerous progeny, and on his death his fifth son, Haidar Mirza, proclaimed himself king, supported in his pretensions by the Kizil-bash tribe of Ustujulu. Another tribe, the Afshar, insisted on the succession of the fourth son, Isma'il. Had it not been that there were two candidates in the field, the contention would have resembled that which arose shortly after Ṭahmasp's accession. Finally Isma'il, profiting from his brother's weak character and the intrigues set on foot against him, obtained his object, and was brought from a prison to receive the crown.

Isma'il II.

The reign of Isma'il II. lasted less than two years. He was found dead in the house of a confectioner in Kazvin, having left the world either drunk, drugged or poisoned. No steps were taken to verify the circumstances, for the event itself was a cause of general relief and joy. He was succeeded by his eldest brother, Mahommed Mirza, otherwise called Mahommed Khudabanda, whose claim to sovereignty had been originally put aside on the ground of physical infirmity. He had the good sense to trust his state affairs almost wholly to an able minister; but he was cowardly enough to deliver up that minister into the hands of his enemies. His kingdom was distracted by intestine divisions and rebellion, and the foe appeared also from without. On the east his youngest son, 'Abbas, held possession of Khorasan; on the west the sultan's troops again entered Azerbaijan and took Tabriz. His eldest son, Hamza Mirza, upheld his fortunes to the utmost of his power, reduced the rebel chieftains, and forced the Turks to make peace and retire; but he was stabbed to death by an assassin. On the news of his death reaching Khorasan, Murshid Kuli Khan, leader of the Ustujulu Kizil-bash, who had made good in fight his claims to the guardianship of 'Abbas, at once conducted the young prince from that province to Kazvin, and occupied the royal city. The object was evident, and in accordance with the popular feeling. 'Abbas, who had been proclaimed king by the nobles at Nishapur some two or three years before this occurrence, may be said to have now undertaken in earnest the cares of sovereignty. His ill-starred father, at no time more than a nominal ruler, was at Shiraz, apparently deserted by soldiers and people. Malcolm infers that he died a natural death, but when[3] or where is not stated.

Mahommed Khudabanda.

'Abbas the Great.

Shah 'Abbas the Great commenced his long and glorious reign (1586) by retracing his steps towards Khorasan, which had been reinvaded by the Uzbegs almost immediately after his departure thence with the Kizil-bash chief. They had besieged and taken Herat, killed the governor, plundered the town, and laid waste the surrounding country. 'Abbas advanced to Meshed, but owing to internal troubles he was compelled to return to Kazvin without going farther east. In his absence 'Abd-ul-Munim Khan, the Uzbeg commander, attacked the sacred city, obtained possession of it while the shah lay helplessly ill at Teherān, and allowed his savage soldiers full licence to kill and plunder. The whole kingdom was perplexed, and 'Abbas had much work to restore confidence and tranquillity. But circumstances rendered impossible his immediate renewal of the Khorasan warfare. He was summoned to Shiraz to put down rebellion in Fars; and before he could drive out the Uzbegs, he had to secure himself against Turkish inroads threatening from the west. He had been engaged in a war with Murad III. in Georgia. Peace was concluded between the two sovereigns in 1590; but the terms were unfavourable to Persia, who lost thereby Tabriz and one or more of the Caspian ports. A stipulation was included in the treaty to the effect that Persians were not to curse any longer the first three caliphs, —a sort of privilege previously enjoyed by Shi'ites as part and parcel of their religious faith.

In 1597 'Abbas renewed operations against the Uzbegs, and succeeded in recovering from them Herat and Khorasan. Eastward he extended his dominions to Balkh, and in the south his generals made the conquest of Bahrain (Bahrein), on the Arabian side of the Persian Gulf, and the territory and islands of the Persian seaboard, inclusive of the mountainous province of Lar. He strengthened his position in Khorasan by planting colonies of Kurdish horsemen on the frontier, or along what is called the " atak " or skirt of the Turkoman mountains north of Persia. In 1601 the war with the Ottoman Empire, which had been partially renewed prior to the death of Sultan Murad in 1595, with little success on the Turkish side, was now entered upon by 'Abbas with more vigour. Taking advantage of the weakness of his ancient enemy in the days of the poor voluptuary Mahommed III., he began rapidly to recover the provinces which Persia had lost in preceding reigns, and continued to reap his advantages in succeeding campaigns under Ahmed I., until under Othman II. a peace was signed restoring to Persia the boundaries which she had obtained under the first Isma'il. On the other side Kandahar, which Ṭahmasp's lieutenant had yielded to the Great Mogul, was recovered from that potentate in 1609.

At the age of seventy, after a reign of forty-two years, 'Abbas died at his favourite palace of Farahabad, on the coast of Mazandaran, on the night of the 27th of January 1628. Perhaps the most distinguished of all Persian kings, his fame was not merely local but world-wide. At his court were ambassadors from England, Russia, Spain, Portugal, Holland and India.

[1] Creasy says that " Suliman led his armies against the Persians in several campaigns (1533, 1534, 1535, 1548, 1553, 1554), during which the Turks often suffered severely through the difficult nature of the countries traversed, as well as through the bravery and activity of the enemy." All the years given were in the reign of Ṭahmasp I.

[2] Purchas.

[3] Krusinski says in 1585.

To his Christian subjects he was a kind and tolerant ruler. The establishment of internal tranquillity, the expulsion of interlopers and marauders like Turks and Uzbegs, the introduction of salutary laws and the promotion of public works of utility—these alone would render remarkable his two-score years of enlightened government. With a fine face, "of which the most remarkable features were a high nose and a keen and piercing eye,"[1] he is said to have been below the middle height, robust, active, a sportsman, and capable of much endurance. It is, however, to be regretted that this monarch's memory is tarnished by more than one dark deed. The murder of his eldest son, Ṣufi Mirza, and the cruel treatment of the two younger brothers, were stains which could not be obliterated by an after-repentance. All that can be now said or done in the matter is to repeat the testimony of historians that his grief for the loss of Ṣufi Mirza was profound, and that, on his death-bed, he nominated that prince's son (his own grandson) his successor.

Sam Mirza was seventeen years of age when the nobles, in fulfilment of the charge committed to them, proclaimed him king under the title of Shah Ṣufi. He reigned fourteen years, and his reign was a succession of barbarities, which can only be attributed to an evil disposition acted upon by an education void of all civilizing influences. When left to his own devices he became a drunkard and a murderer, and is accused of the death of his mother, sister and favourite queen. Among many other sufferers Imam Kuli Khan, conqueror of Lar and Hormuz, the son of one of 'Abbas's most famous generals, founder of a college at Shiraz, and otherwise a public benefactor, fell a victim to his savage cruelty. During his reign the Uzbegs were driven back from Khorasan, and a rebellion was suppressed in Gilan; but Kandahar was again handed over to the Moguls of Delhi, and Bagdad retaken from Persia by Sultan Murad—both serious national losses. Tavernier, without charging the shah with injustice to Christians, mentions the circumstance that "the first and only European ever publicly executed in Persia was in his reign." He was a watchmaker named Rodolph Stadler, who had slain a Persian on suspicion of intrigue with his wife. Offered his life if he became a Moslem, he resolutely declined the proposal, and was decapitated. His tomb is to be recognized at Isfahan by the words "Cy git Rodolphe" on a long wide slab. Shah Ṣufi died (1641) at Kashan and was buried at Kum.

Shah Ṣufi.

His son, 'Abbas II., succeeded him. Beyond regaining Kandahar, an operation which he is said to have directed in person when barely sixteen, there is not much to mark his life to the outer world. As to foreign relations, he received embassies from Europe and a deputation from the French East India Company; he sought to conciliate the Uzbegs by treating their refugee chiefs with unusual honour and sumptuous hospitality; he kept on good terms with Turkey; he forgave the hostility of a Georgian prince when brought to him a captive; and he was tolerant to all religions—always regarding Christians with especial favour. But he was a drunkard and a debauchee, and chroniclers are divided in opinion as to whether he died from the effects of drink or licentious living. That he changed the system of blinding his relatives from passing a hot metal over the open eye to an extraction of the whole pupil is indicative of gross brutality. 'Abbas II. died (1668) at the age of thirty-eight, after a reign of twenty-seven years, and was buried at Kum in the same mosque as his father.

'Abbas II.

'Abbas was succeeded by his son, Shah Ṣufi II., crowned a second time under the name of Shah Suleiman. Though weak, dissolute and cruel, Suleiman is not without his panegyrists. Chardin, whose testimony is all the more valuable from the fact that he was contemporary with him, relates many stories characteristic of his temper and habits. He kept up a court at Isfahan which surprised and delighted his foreign visitors, among whom were ambassadors from European states; and one learned writer, Kaempfer, credits him with wisdom and good policy. During his reign Khorasan was invaded by the ever-encroaching Uzbegs, the Kipchak Tatars plundered the shores of the Caspian, and the island of Kishm was taken by the Dutch; but the kingdom suffered otherwise no material loss. He died in 1694, in the forty-ninth year of his age and twenty-sixth of his reign.

Suleiman.

About a year before his death he is described by Sanson,[2] a missionary from the French king Louis XIV., as tall, strong and active, "a fine prince—a little too effeminate for a monarch," with "a Roman nose very well proportioned to other parts," very large blue eyes, and "a midling mouth, a beard painted black, shav'd round, and well turn'd, even to his ears." The same writer greatly praises him for his kindness to Christian missionaries.

Krusinski's memoir is full of particulars regarding Shah Ḥosain, the successor of Suleiman. He had an elder and a younger brother, sons of the same mother, but the eldest had been put to death by his father's orders, and the youngest secreted by maternal precaution lest a similar fate should overtake him. There was, however, a second candidate for power in the person of a half-brother, 'Abbas. The latter prince was the worthier of the throne, but the other better suited the policy of the eunuchs and those noblemen who had the right of election. Indeed Suleiman himself is reported to have told the grandees around him, in his last days, that "if they were for a martial king that would always keep his foot in the stirrup they ought to choose Mirza 'Abbas, but that if they wished for a peaceable reign and a pacific king they ought to fix their eyes upon Ḥosain." But he himself made no definite choice.

Ḥosain.

Ḥosain was selected, as might have been anticipated. On his accession (1694) he displayed his attachment to religious observances by prohibiting the use of wine—causing all wine-vessels to be brought out of the royal cellars and destroyed, and forbidding the Armenians to sell any more of their stock in Isfahan. The shah's grandmother, by feigning herself sick and dependent upon wine only for cure, obtained reversal of the edict. For the following account of Shah Ḥosain and his successors to the accession of Nadir Shah, Sir Clements Markham's account has been mainly utilized.

The new king soon fell under the influence of mullahs, and was led so far to forget his own origin as to persecute the Sufis. Though good-hearted he was weak and licentious; and once out of the hands of the fanatical party he became ensnared by women and entangled in harem intrigues. For twenty years a profound peace prevailed throughout the empire, but it was the precursor of a terrible storm destined to destroy the Safawid dynasty and scatter calamity broadcast over Persia. In the mountainous districts of Kandahar and Kabul the hardy tribes of Afghans had for centuries led a wild and almost independent life. They were divided into two great branches—the Ghilzais of Ghazni and Kabul and the Saduzais of Kandahar and Herat. In 1702 a newly-appointed governor, one Shah Nawaz, called Gurji Khan from having been "wali" or ruler of Georgia, arrived at Kandahar with a tolerably large force. He was a clever and energetic man, and had been instructed to take severe measures with the Afghans, some of whom were suspected of intriguing to restore the city to the Delhi emperor. At this time Kandahar had been for sixty years uninterruptedly in the shah's possession. The governor appears to have given great offence by the harshness of his proceedings, and a Ghilzai chief named Mir Wa'iz, who had complained of his tyranny, was sent a prisoner to Isfahan. This person had much ability and no little cunning. He was permitted to go on a pilgrimage to Mecca, and on his return in 1708 he so gained upon the confidence of the Persian court that he was allowed to go back to his country. At Kandahar he planned a conspiracy against the government, slew Gurji Khan and his retinue, seized the city, defeated two Persian armies sent against him, and died a natural death in 1715. His brother, Mir 'Abdallah, succeeded him in the government of the Afghans; but after a few months, Mahmud, a son of Mir Wa'iz, a very young man, murdered his uncle and assumed the title of a sovereign prince.

In the meanwhile the Saduzai tribe revolted at Herat, and declared itself independent in 1717; the Kurds overran the country round Hamadan; the Uzbegs desolated Khorasan; and the Arabs of Muscat seized the island of Bahrein and threatened Bander Abbasi. Thus surrounded by dangers on all sides the wretched shah was bewildered. He made one vain attempt to regain his possessions in the Persian

[1] Malcolm.

[2] *Present State of Persia* (London, 1695).

Gulf; but the Portuguese fleet which had promised to transport his troops to Bahrein was defeated by the imam of Muscat and forced to retreat to Goa.

The court of Isfahan had no sooner received tidings of this disaster than Mahmud, with a large army of Afghans, invaded Persia in the year 1721, seized Kermān, and in the following year advanced to within four days' march of the city of Isfahan. The shah offered him a sum of money to return to Kandahar, but the Afghan answered by advancing to a place called Gulnabad, within 9 m. of the capital. The ill-disciplined Persian army, hastily collected, advanced to attack the rebels. Its centre was led by Sheikh 'Ali Khan, covered by twenty-four field-pieces. The wali of Arabia commanded the right, and the 'itimadu' d-daulah, or prime minister, the left wing. The whole force amounted to 50,000 men, while the Afghans could not count half that number.

Afghan Invasion.

On the 8th of March 1722 the richly dressed hosts of Persia appeared before the little band of Afghans, who were scorched and disfigured by their long marches. The wali of Arabia commenced the battle by attacking the left wing of the Afghans with great fury, routing it, and plundering their camp. The prime minister immediately afterwards attacked the enemy's right wing, but was routed, and the Afghans, taking advantage of the confusion, captured the Persian guns and turned them on the Persian centre, who fled in confusion without striking a blow. The wali of Arabia escaped into Isfahan, and Mahmud the Afghan gained a complete victory. Fifteen thousand Persians remained dead on the field. A panic now seized on the surrounding inhabitants, and thousands of country people fled into the city. Isfahan was then one of the most magnificent cities in Asia, containing more than 600,000 inhabitants. Mahmud seized on the Armenian suburb of Julfa, and invested the doomed city; but Ṭahmasp, son of the shah, had previously escaped into the mountains of Mazandaran. Famine soon began to press hard upon the besieged, and in September Shah Ḥosain offered to capitulate. Having been conducted to the Afghan camp, he fixed the royal plume of feathers on the young rebel's turban with his own hand; and 4000 Afghans were ordered to occupy the palace and gates of the city.[1] Mahmud entered Isfahan in triumph, with the captive shah on his left hand, and, seating himself on the throne in the royal palace, he was saluted as sovereign of Persia by the unfortunate Ḥosain. When Tahmasp, the fugitive prince, received tidings of the abdication of his father, he at once assumed the title of shah at Kazvin.

Mahmud's Usurpation.

Turkey and Russia were not slow to take advantage of the calamities of Persia. The Turks seized on Tiflis, Tabriz and Hamadan, while Peter the Great, whose aid had been sought by the friendless Ṭahmasp, fitted out a fleet on the Caspian.[2] The Russians occupied Shirvan, and the province of Gilan south-west of the Caspian;[3] and Peter made a treaty with Ṭahmasp II. in July 1722, by which he agreed to drive the Afghans out of Persia on condition that Darband (Derbend), Baku, Gilan, Mazandaran and Astarabad were ceded to Russia in perpetuity. These were all the richest and most important northern provinces of Persia.

Meanwhile the invader, in 1723, invited 300 of the principal Persian nobility to a banquet and massacred them. To prevent their children rising up in vengeance they were all murdered also. Then he proceeded to slaughter vast numbers of the citizens of Isfahan, until the place was nearly depopulated. Not content with this, in February 1725 he assembled all the captives of the royal family, except the shah, in the courtyard of the palace, and caused them all to be murdered, commencing the massacre with his own hand. The wretched Ḥosain was himself wounded in endeavouring vainly to save his infant son, only five years of age. All the males of the royal family, except Ḥosain himself, Ṭahmasp and two children, are said to have perished. At length the inhuman miscreant Mahmud died, at the early age of twenty-seven, on the 22nd of April 1725. With scarcely any neck, he had round shoulders, a broad face with a flat nose, a thin beard, and squinting eyes, which were generally downcast.

Mahmud was succeeded by his first cousin, Ashraf, the son of Mir 'Abdallah. He was a brave but cruel Afghan. He gave the dethroned shah a handsome allowance, and strove, by a mild policy, to acquire popularity. In 1727, after a short war, he signed a treaty with the Turks, acknowledging the sultan as chief of the Moslems. But the fortunate star of Ṭahmasp II. was now beginning to rise, and the days of Afghan usurpation were numbered. He had collected a small army in Mazandaran, and was supported by Fath 'Ali Khan, the powerful chief of the Kajar tribe. In 1727 the fugitive shah was joined by Nadir Kuli, a robber chief, who murdered Fath 'Ali, and, having easily appeased the shah, received the command of the royal army. In 1729 Ashraf became alarmed, and led an Afghan army into Khorasan, where he was defeated by Nadir at Damghan, and forced to retreat. The Persian general followed close in his rear and again defeated him outside Isfahan in November of the same year. The Afghans fled through the town; and Ashraf, murdering the poor old shah Ḥosain on his way, hurried with the wreck of his army towards Shiraz. On the 16th of November the victorious Nadir entered Isfahan, and was soon followed by the young shah Ṭahmasp II., who burst into tears when he beheld the ruined palace of his ancestors. His mother, who had escaped the numerous massacres by disguising herself as a slave and performing the most degrading offices, now came forth and threw herself into his arms. Nadir did not give his enemies time to recover from their defeat. He followed them up, and again utterly routed them in January 1730. Ashraf tried to escape to Kandahar almost alone, but was murdered by a party of Baluch robbers; and thus, by the genius of Nadir, his native land was delivered from the terrible Afghan invaders.

Expulsion of Afghans.

The ambition of Nadir, however, was far greater than his loyalty. On pretext of incapacity, he dethroned Tahmasp II. in 1732, and sent him a prisoner into Khorasan, where he was murdered some years afterwards by Nadir's son while the conqueror was absent on his Indian expedition. For a short time the wily usurper placed Ṭahmasp's son on the throne, a little child, with the title of 'Abbas III., while he contented himself with the office of regent. Poor little 'Abbas died at a very convenient time, in the year 1736, and Nadir then threw off the mask. He was proclaimed shah of Persia by a vast assemblage on the plain of Moghan.

Fall of Safawids.

By the fall of the Safawid dynasty Persia lost her race of national monarchs, considered not only in respect of origin and birthplace but in essence and in spirit. Isma'il, Ṭahmasp and 'Abbas, whatever their faults and failings, were Persian and peculiar to Persians. Regarded in a sober English spirit, the reign of the great 'Abbas is rendered mythical by crime. But something liberal in the philosophy of their progenitors threw an attractiveness over the earlier Safawid kings which was wanting in those who came after them. The fact is that, two centuries after Shah Isma'il's accession to the throne, the Safawid race of kings was effete; and it became necessary to make room for a more vigorous if not a more lasting rule. Nadir was the strong man for the hour and occasion. He had been designated a "robber chief"; but his antecedents, like those of many others who have filled the position, have redeeming points of melodramatic interest.

A map attached to Krusinski's volumes illustrates the extent of Persian territory in 1728, or one year before Ashraf was finally defeated by Nadir, and some eight years prior to the date on which Nadir was himself proclaimed king. It shows, during the reign of the Safawids, Tiflis, Erivan, Khoi and Bagdad to have been within the limits of Persia on the west, and in like manner Balkh and Kandahar to have been included within the eastern border. There is, however, also shown, as a result of the Afghan intrusion and the impotency of the later Safawid kings, a long broad strip of country to the west, including Tabriz and Hamadan, marked "conquests of the Turks," and the whole west shore of the Caspian from Astrakan to Mazandaran marked "conquests of the czar of Muscovy"; Makran, written Mecran, is designated "a warlike independent nation." If further allowance be made for the district held by the Afghan invaders as part of their own country, it will be seen how greatly the extent of Persia proper was reduced, and what a work Nadir had before him to restore the kingdom to its former proportions.

Persia in 1728.

But the former proportions had been partly reverted to, and would doubtless have been in some respects exceeded, both in Afghanistan and the Ottoman dominions and on the shores of the Caspian, by the action of this indefatigable general, had not Ṭahmasp II. been led into a premature treaty with the Turks. Nadir's anger and indignation had been great at this weak proceeding; indeed, he had made it the ostensible cause of the shah's deposition. He had addressed letters to all the military chiefs of the country, calling upon them for support; he had sent an envoy to Constantinople insisting upon the sultan's restoration of the Persian provinces still in his possession—that is,

[1] We have an account of the Afghan invasion and sack of Isfahan from an eyewitness, Father Krusinski, procurator of the Jesuits at that place, whose interesting work was translated into English in the last century.

[2] In 1721 Sultan Ḥosain sent an embassy to the Russians, seeking aid against the Afghans. In May 1722 a flotilla descended the Volga commanded by Tsar Peter and on the 19th of July the Russian flag first waved over the Caspian. Gilan was occupied by 6000 men under General Matushkin.

[3] The Russians remained in Gilan until 1734, when they were obliged to evacuate it, owing to the unhealthiness of the climate.

Georgia and part of Azerbaijan—and he had threatened Bagdad with assault. As regent, he had failed twice in taking the city of the caliphs, but on the second occasion he had defeated and killed its gallant defender, Topal 'Othman, and he had succeeded in regaining Tiflis, Kars and Erivan.[1]

Russia and Turkey, naturally hostile to one another, had taken occasion of the weakness of Persia to forget their mutual quarrels and unite to plunder the tottering kingdom of the Safawid kings. A partition treaty had been signed between these two powers in 1723, by which the czar was to take Astarabad, Mazandaran, Gilan, part of Shirvan and Daghistan, while the acquisitions of the Porte were to be traced out by a line drawn from the junction of the Aras and Kur rivers, and passing along by Ardebil, Tabriz and Hamadan, and thence to Kermânshâh. Ṭahmasp was to retain the rest of his paternal kingdom on condition of his recognizing the treaty. The ingenious diplomacy of Russia in this transaction was manifested in the fact that she had already acquired the greater part of the territory allotted to her, while Turkey had to obtain her share by further conquest. But the combination to despoil a feeble neighbour was outwitted by the energy of a military commander of a remarkable type.

D.—*From the Accession of Nadir Shah, in 1736 to 1884.*

Nadir, it has been said, was proclaimed shah in the plains of Moghan in 1736. Mirza Mahdi relates how this event was brought about by his address to the assembled nobles and officers on the morning of the "Nau-ruz," or Persian New-Year's Day, the response to that appeal being the offer of the crown. The conditions were that the crown should be hereditary in his family, that the claim of the Safawids was to be held for ever extinct, and that measures should be taken to bring the Shi'ites to accept uniformity of worship with the Sunnites. The mulla bashi (or high priest) objecting to the last, Nadir ordered him to be strangled, a command which was carried out on the spot. On the day following, the agreement having been ratified between sovereign and people, he was proclaimed emperor of Persia. At Kazvin the ceremony of inauguration took place. The edict expressing the royal will on the religious question is dated in June, but the date of coronation is uncertain. From Kazvin Nadir moved to Isfahan, where he organized an expedition against Kandahar, then in the possession of a brother of Mahmud, the conqueror of Shah Ḥosain. But before setting out for Afghanistan he took measures to secure the internal quiet of Persia, attacking and seizing in his stronghold the chief of the marauding Bakhtiaris, whom he put to death, retaining many of his men for service as soldiers. With an army of 80,000 men he marched through Khorasan and Seistan to Kandahar, which city he blockaded ineffectually for a year; but it finally capitulated on the loss of the citadel. Balkh fell to Riẓa Kuli, the king's son, who, moreover, crossed the Oxus and defeated the Uzbegs in battle. Besides tracing out the lines of Nadirabad, a town since merged in modern Kandahar, Nadir had taken advantage of the time available and of opportunities presented to enlist a large number of men from the Abdali and Ghilzai tribes. It is said that as many as 16,000 were at his disposal. His rejection of the Shi'ite tenets as a state religion seems to have propitiated the Sunnite Afghans.

Nadir's Coronation.

Nadir had sent an ambassador into Hindustan requesting the Mogul emperor to order the surrender of certain unruly Afghans who had taken refuge within Indian territory, but no satisfactory reply was given, and obstacles were thrown in the way of the return of the embassy. The Persian monarch, not sorry perhaps to find a plausible pretext for encroachment in a quarter so full of promise to booty-seeking soldiers, pursued some of the fugitives through Ghazni to Kabul, which city was then under the immediate control of Naṣr Khan, governor of eastern Afghanistan, for Mahommed Shah of Delhi. This functionary, alarmed at the near approach of the Persians, fled to Peshawar. Kabul had long been considered not only an integral part but also one of the main gates of the Indian Empire; notwithstanding a stout resistance on the part of its commandant, Shir or Shirzah Khan, the place was stormed and carried (1738) by Nadir, who moved on eastward. Mirza Mahdi relates that from the Kabul plain he addressed a new remonstrance to the Delhi court, but that his envoy was arrested and killed, and his escort compelled to return by the governor of Jalalabad. The same authority notes the occupation of the latter place by Persian troops and the march thither from Gandamak. It was probably through the Khaibar (Khyher) Pass that he passed into the Peshawar plain, for it was there that he first defeated the Imperial forces.

Invasion of India.

The invasion of India had now fairly commenced, and its successful progress and consummation were mere questions of time. The prestige of this Eastern Napoleon was immense. It had not only reached but had been very keenly felt at Delhi before the conquering army had arrived. There was no actual religious war; all sectarian distinction had been disavowed; the contest was between vigorous Mahommedans and effete Mahommedans. Nadir's way had been prepared by circumstances, and as he progressed from day to day his army increased. There must have been larger accessions by voluntary recruits than losses by death or desertion. The victory on the plain of Karnal, whether accomplished by sheer fighting or the intervention of treachery, was the natural outcome of the previous situation, and the submission of the emperor followed as a matter of course.

Delhi must have experienced a sense of relief at the departure of its conqueror, whose residence there had been rendered painfully memorable by carnage and riot. The marriage of his son to the granddaughter of Aurangzeb and the formal restoration of the crown to the dethroned emperor were doubtless politic, but the descendant of Babar could not easily forget how humiliating a chapter in history would remain to be written against him. The return march of Nadir to Persia is not recorded with precision. On the 5th of May 1739 he left the gardens of Shalamar, and proceeded by way of Lahore and Peshawar through the passes to Kabul. Thence he seems to have returned to Kandahar, and in May 1740—just one year after his departure from Delhi—he was in Herat displaying the imperial throne and other costly trophies to the gaze of the admiring inhabitants. Sind was certainly included in the cession to him by Mahommed Shah of "all the territories westward of the river Attok," but only that portion of it, such as Thattah (Tatta), situated on the right bank of the Indus.

From Herat he moved upon Balkh and Bokhara, and received the submission of Abu'l-Faiz Khan, the Uzbeg ruler, whom he restored to his throne on condition that the Oxus should be the acknowledged boundary between the two empires. The khan of Khwarizm, who had made repeated depredations in Persian territory, was taken prisoner and executed. Nadir then visited the strong fortress of Kelat, to which he was greatly attached as the scene of his boyish exploits, and Meshed, which he constituted the capital of his empire. He had extended his boundary on the east to the Indus, and to the Oxus on the north.

Northern Conquests.

On the south he was restricted by the Arabian Ocean and Persian Gulf; but the west remained open to his further progress. He had in the first place to revenge the death of his brother Ibrahim Khan, slain by the Lesghians; and a campaign against the Turks might follow in due course. The first movement was unsuccessful, and indirectly attended with disastrous consequences. Nadir, when hastening to the support of some Afghan levies who were doing good service, was fired at and wounded by a stray assailant; suspecting his son, Riẓa Kuli, of complicity, he commanded the unfortunate prince to be seized and deprived of sight. From that time the heroism of the monarch appeared to die out. He became morose, tyrannical and suspicious. An easy victory over the Turks gave him but little additional glory; and he readily concluded a peace with the sultan which brought but

Wars in the West.

[1] Malcolm.

insignificant gain to Persia.[1] Another battle won from the Ottoman troops near Diarbekr by Naṣr Ullah Mirza, the young prince who had married a princess of Delhi, left matters much the same as before.

The last years of Nadir's life were full of internal trouble. On the part of the sovereign, murders and executions; on that of his subjects, revolt and conspiracy. Such a state of things could not last, and certain proscribed persons plotted the destruction of the half-demented tyrant. He was despatched by Salah Bey, captain of his guards (1747). He was some sixty years of age, and had reigned eleven years. About the time of setting out on his Indian expedition he was described as a most comely man, upwards of 6 ft., tall, well-proportioned, of robust make and constitution; inclined to be fat, but prevented by the fatigue he underwent; with fine, large black eyes and eyebrows; of sanguine complexion, made more manly by the influence of sun and weather; a loud, strong voice; a moderate wine-drinker; fond of simple diet, such as pilaos and plain dishes, but often neglectful of meals altogether, and satisfied, if occasion required, with parched peas and water, always to be procured.[2]

During the reign of Nadir an attempt was made to establish a British Caspian trade with Persia. The names of Jonas Hanway and John Elton were honourably connected with this undertaking; and the former has left most valuable records of the time and country.

From Nadir Shah to the Kajar Dynasty.—After the death of Nadir Shah something like anarchy prevailed for thirteen years in the greater part of Persia as it existed under Shah 'Abbas. No sooner had the crime become known than Aḥmad Khan, chief of the Abdali Afghans, took possession of Kandahar and a certain amount of treasure. By the action of Aḥmad Abdali, Afghanistan was at once lost to the Persian crown, for this leader was strong enough to found an independent kingdom. The chief of the Bakhtiaris, Rashid, also with treasure, fled to the mountains, and the conspirators invited 'Ali, a nephew of the deceased monarch, to ascend the vacant throne. The Bakhtiari encouraged his brother, 'Ali Mardan, to compete for the succession to Nadir. The prince was welcomed by his subjects; he told them that the murder of his uncle was due to his own instigation, and, in order to conciliate them, remitted the revenues of the current year and all extraordinary taxes for the two years following.

Period of Anarchy.

Taking the title of 'Adil Shah, or the "just" king, he commenced his reign by putting to death the two princes Riẓa Kuli and Naṣr Ullah, as well as all relatives whom he considered his competitors, with the exception of Shah Rukh, son of Riẓa Kuli, whom he spared in case a lineal descendant of Nadir should at any time be required. But he had not removed all dangerous members of the royal house, nor had he gauged the temper of the times or people. 'Adil Shah was soon dethroned by his own brother, Ibrahim, and he in his turn was defeated by the adherents of Shah Rukh, who made their leader king.

This young prince had a better and more legitimate title than that of the grandson of Nadir, for he was also grandson, on the mother's side, of the Safawid Shah Ḥusain. Amiable, generous and liberal-minded, and of prepossessing exterior, he proved to be a popular prince. But he was neither of an age nor character to rule over a people led by turbulent and disaffected chiefs, ever divided by the conflicting interests of personal ambition. Sa'id Mahommed, son of Mirza Daud, a chief mullah at Meshed, whose mother was the reputed daughter of Suleiman, declared himself king, and imprisoned and blinded Shah Rukh. Yusuf 'Ali, the general commanding the royal troops, defeated and slew Suleiman, and replaced his master on the throne, reserving to himself the protectorship or regency. A new combination of chiefs, of which Ji'afar the Kurd and Mir 'Alam the Arabian are the principal names handed down, brought about the death of Yusuf 'Ali and the second imprisonment of Shah Rukh. These events were followed by a quarrel terminating in the supremacy of the Arab. At this juncture Aḥmad Shah Abdali reappeared in Persian Khorasan from Herat; he attacked and took possession of Meshed, slew Mir 'Alam, and, pledging the local chiefs to support the blinded prince in retaining the kingdom of his grandfather, returned to Afghanistan. But thenceforward this unfortunate young man was a mere shadow of royalty, and his purely local power and prestige had no further influence whatever on Persia as a country.

Shah Rukh.

The land was partitioned among several distinguished persons, who had of old been biding their opportunities, or were born of the occasion. Foremost among these was Mahommed Ḥasan Khan, hereditary chief of those Kajars who were established in the south-east corner of the Caspian. His father, Fatḥ 'Ali Khan, after sheltering Shah Ṭahmasp II. at his home in Astarabad, and long acting as one of his most loyal supporters, had been put to death by Nadir, who had appointed a successor to his chiefdom from the "Yukari" or "upper" Kajars, instead of from his own, the "Ashagha," or "lower."[3] Mahommed, with his brother, had fled to the Turkomans, by whose aid he had attempted the recovery of Astarabad, but had not succeeded in regaining a permanent footing there until Nadir had been removed. On the murder of the tyrant he had raised the standard of independence, successfully resisted Aḥmad Shah and his Afghans, who sought to check his progress in the interests of Shah Rukh, and eventually brought under his own sway the valuable provinces of Gilan, Mazandaran and Astarabad[4]—quite a little kingdom in itself. In the large important province of Azerbaijan, Azad Khan, one of Nadir's generals, had established a separate government; and 'Ali Mardan, brother of the Bakhtiari chief, took forcible possession of Isfahan, empowering Shah Rukh's governor, Abu'l-Fatḥ Khan, to act for the new master instead of the old.

Further Confusion.

Had 'Ali Mardan declared himself an independent ruler he would have been by far the most important of the three persons named. But such usurpation at the old Safawid capital would have been too flagrant an act for general assent; so he put forward Isma'il, a nephew of Shah Ḥusain, as the representative of sovereignty, and himself as one of his two ministers—the other being Karim Khan, a chief of the Zend Kurds. Shah Isma'il, it need scarcely be said, possessed no real authority; but the ministers were strong men in their way, and the Zend especially had many high and excellent qualities. After a time 'Ali Mardan was assassinated, and Karim Khan became the sole living power at Isfahan. The story of the period is thus told by R. G. Watson:—

"The three rivals, Karīm, Azad and Muhammad Hasan, proceeded to settle, by means of the sword, the question as to which of them was to be the sole master of Persia. A three-sided war then ensued, in the course of which each of the combatants in turn seemed at one time sure to be the final conqueror. Karīm, when he had arranged matters at Ispahan, marched to the borders of Mazandarān, where the governor of that province was ready to meet him. After a closely contested battle victory remained with Muhammad Hasan; who, however, was unable to follow up the foe, as he had to return in order to encounter Azad. That leader had invaded Gilan, but, on the news reaching him of the victory which the governor of Mazandarān had gained, he thought it prudent to retrace his steps to Sultanīyah. Karīm reunited his shattered forces at Tehrān, and retired to Ispahan to prepare for a second campaign. When he again took the field it was not to measure himself once more with the Kajar chief, but to put down the pretensions of Azad. The wary Afghan, however, shut himself up in Kazvīn, a position from which he was enabled to inflict much injury on the army of Karīm, while his own troops remained unharmed behind the walls of the town. Karīm retired a second time to

Struggle of the Three Rivals.

[1] Creasy says the war broke out in 1743, but was terminated in 1746 by a treaty which made little change in the old arrangements fixed under Murad IV.

[2] Fraser's *History of Nadir Shah* (1742).

[3] There were three branches of the Kajar tribe, *i.e.* the Suldus, Tungkut and Jalaiyar. The last, according to Watson, became settled in Iran and Turan, and seem at first to have given their name to all the tribe.

[4] Watson. Malcolm says that Gilan was under one of its own chiefs, Hidaiyat Khan.

Ispahan, and in the following spring advanced again to meet Azad. A pitched battle took place between them, in which the army of Karim was defeated. He retreated to the capital, closely pressed by the foe. Thence he continued his way to Shiraz, but Azad was still upon his traces. He then threw himself upon the mercy of the Arabs of the Garmsir or hot country, near the Persian Gulf, to whom the name of the Afghans was hateful, and who rose in a body to turn upon Azad. Karīm, by their aid, once more repaired his losses and advanced on Ispahan, while Muhammad Hasan with fifty thousand men was coming from the opposite direction, ready to encounter either the Afghan or the Zend. The Afghan did not await his coming, but retired to his government of Tabriz.

"The Zend issued from Ispahan, and was a second time defeated in a pitched battle by the Kajar. Karīm took refuge behind the walls of Shirāz, and all the efforts of the enemy to dislodge him were ineffectual. Muhammad Hasan Khan in the following year turned his attention to Adarbaijan. Azad was no longer in a position to oppose him in the field, and he in turn became master of every place of importance in the province, while Azad had to seek assistance in vain—first from the pasha of Baghdad, and then from his former enemy, the tsar of Georgia. Next year the conquering Kajar returned to Shirāz to make an end of the only rival who now stood in his way. On his side were 80,000 men, commanded by a general who had twice defeated the Zend chief on an equal field. Karīm was still obliged to take shelter in Shirāz, and to employ artifice in order to supply the place of the force in which he was deficient. Nor were his efforts in this respect unattended with success: seduced by his gold, many of the troops of the Kajar began to desert their banners. In the meantime the neighbourhood of Shirāz was laid waste, so as to destroy the source from which Muhammad Hasan drew his provisions; by degrees his army vanished, and he had finally to retreat with rapidity to Ispahan with the few men that remained to him. Finding his position there to be untenable, he retreated still farther to the country of his own tribe, while his rival advanced to Ispahan, where he received the submission of nearly all the chief cities of Persia. The ablest of Karīm's officers, Shaikh 'Ali, was sent in pursuit of the Kajar chief. The fidelity of the commander to whom that chieftain had confided the care of the pass leading into Mazandarān, was corrupted; and, as no further retreat was open to him, he found himself under the necessity of fighting. The combat which ensued resulted in his complete defeat, although he presented to his followers an example of the most determined valour. While attempting to effect his escape he was recognized by the chief of the other branch of the Kajar tribe, who had deserted his cause, and who had a blood-feud with him, in pursuance of which he now put him to death.

"For nineteen years after this event Karīm Khan ruled with the title of wakil, or regent, over the whole of Persia, excepting the province of Khurāsān. He made Shirāz the seat of his government, and by means of his brothers put down every attempt which was made to subvert his authority. The rule of the great Zend chief was just and mild, and he is on the whole, considering his education and the circumstances under which he was placed, one of the most faultless characters to be met with in Persian history."

Karim Khan.

Karim Khan died at his capital in 1779 in the twentieth year of his reign, and, it is said, in the eightieth of his age. He built the great bazaar of Shiraz, had a tomb constructed over the remains of Hafiz, and repaired the "turbat" at the grave of Sa'di, outside the walls. He encouraged commerce and agriculture, gave much attention to the shores of the Persian Gulf, and carefully studied the welfare of the Armenian community settled in his dominions. In his time the British factory was removed from Bander Abbasi to Bushire.

On Karim's death a new period of anarchy supervened. His brother, Zaki, a cruel and vindictive chief who, when governor of Isfahan, had revolted against Karim, assumed the government. At the same time he proclaimed Abu 'l-Fatḥ Khan, second son of the deceased monarch, and his brother Mahommed 'Ali, joint-successors to the throne. The seizure of the citadel at Shiraz by the adherents of the former, among whom were the more influential of the Zends, may have induced him to adopt this measure as one of prudent conciliation. But the garrison held out, and, to avoid a protracted siege, he had recourse to treachery. The suspicious nobles were solemnly adjured to trust themselves to his keeping, under promise of forgiveness. They believed his professions, tendered their submission, and were cruelly butchered. Zaki did not long enjoy the fruits of his perfidious dealing. The death of Karim Khan had raised two formidable adversaries to mar his peace.

Zaki.

Aga Mahommed, son of Mahommed Ḥasan, the Kajar chief of Astarabad, a prisoner at large in Shiraz, was in the environs of that city awaiting intelligence of the old king's decease, and, hearing it, instantly escaped to Mazandaran, there to gather his tribesmen together and compete for the crown of Persia. Taken prisoner by Nadir and barbarously mutilated by 'Adil Shah, he had afterwards found means to rejoin his people, but had surrendered himself to Karim Khan when his father was killed in battle. On the other hand, Sadik, brother to Zaki, who had won considerable and deserved repute by the capture of Basra from the Turkish governor, abandoned his hold of the conquered town on hearing of the death of Karim, and appeared with his army before Shiraz. To provide against the intended action of the first, Zaki detached his nephew, 'Ali Murad, at the head of his best troops to proceed with all speed to the north; and, as to the second, the seizure of such families of Sadik's followers as were then within the walls of the town, and other violent measures, struck such dismay into the hearts of the besieging soldiers that they dispersed and abandoned their leader to his fate. From Kermān, however, where he found an asylum, the latter addressed an urgent appeal for assistance to 'Ali Murad. This chief, encamped at Teherān when the communication reached him, submitted the matter to his men, who decided against Zaki, but put forward their own captain as the only master they would acknowledge. 'Ali Murad, leaving the pursuit of Aga Mahommed, then returned to Isfahan, where he was received with satisfaction, on the declaration that his one object was to restore to his lawful inheritance the eldest son of Karim Khan, whom Zaki had set aside in favour of a younger brother. The sequel is full of dramatic interest. Zaki, enraged at his nephew's desertion, marched out of Shiraz towards Isfahan. On his way he came to the town of Yezdikhast, where he demanded a sum of money from the inhabitants, claiming it as part of secreted revenue; the demand was refused, and eighteen of the head men were thrown down the precipice beneath his window; a "saiyid," or holy man, was the next victim, and his wife and daughter were to be given over to the soldiery, when a suddenly-formed conspiracy took effect, and Zaki's own life was taken in retribution for his guilt (1779).

'Ali Murad.

When intelligence of these events reached Kermān, Sadik Khan hastened to Shiraz, proclaimed himself king in place of Abu 'l-Fatḥ Khan, whom he declared incompetent to reign, and put out the eyes of the young prince. He despatched his son Ji'afir to assume the government of Isfahan, and watch the movements of 'Ali Murad, who appears to have been then absent from that city; and he gave a younger son, 'Ali Naki, command of an army in the field. The campaign ended in the capture of Shiraz and assumption of sovereignty by 'Ali Murad, who caused Sadik Khan to be put to death.

From this period up to the accession of Aga Mahommed Khan the summarized history of Markham will supply the principal facts required.

Lutf 'Ali Khan.

'Ali Murad reigned over Persia until 1785, and carried on a successful war with Aga Mahommed in Mazandaran, defeating him in several engagements, and occupying Teherān and Sari. He died on his way from the former place to Isfahan, and was succeeded by Ji'afir, son of Sadik,[1] who reigned at Shiraz, assisted in the government by an able but unprincipled "kalantar," or head magistrate, named Hajji Ibrahim. This ruler was poisoned by the agency of conspirators, one of whom, Saiyid Murad, succeeded to the throne. Hajji Ibrahim, however, contriving to maintain the loyalty of the citizens towards the Zend reigning family, the usurper was killed, and Lutf 'Ali Khan, son of Ji'afir, proclaimed king. He had hastened to Shiraz on hearing of his father's death and received a warm welcome from the inhabitants. Hajji Ibrahim became his chief adviser, and a new minister was found for him in Mirza Ḥosain Shirazi. At the time of his accession Lutf 'Ali Khan was only in his twentieth year, very handsome, tall, graceful, and an excellent horseman. While differing widely in character, he was a worthy successor of Karim Khan, the great founder of the Zend dynasty. Lutf 'Ali Khan had not been many months on the throne when Aga Mahommed advanced to attack him, and invested the city of Shiraz, but retreated soon afterwards to Teherān, which he had made the capital of his dominions. The young king then enjoyed a short period of peace.

[1] A five days' usurpation of Bakir Khan, governor of Isfahan, is not taken into account.

Afterwards, in 1790, he collected his forces and marched against the Kajars, in the direction of Isfahan. But Hajji Ibrahim had been intriguing against his sovereign, to whose family he owed everything, not only with his officers and soldiers but also with Aga Mahommed, the chief of the Kajars, and arch-enemy of the Zends. Lutf 'Ali Khan was suddenly deserted by the whole of his army, except seventy faithful followers; and when he retreated to Shiraz he found the gates closed against him by Hajji Ibrahim, who held the city for the Kajar chief. Thence falling back upon Bushire, he found that the sheikh of that town had also betrayed him. Surrounded by treason on every side, he boldly attacked and routed the chief of Bushire and blockaded Shiraz. His unconquerable valour gained him many followers, and he defeated an army sent against him by the Kajars in 1792.

Aga Mahommed then advanced in person against his rival. He encamped with an army of 30,000 men on the plain of Mardasht, near Shiraz. Lutf 'Ali Khan, in the dead of night, suddenly attacked the camp of his enemy with only a few hundred followers. The Kajars were completely routed and thrown into confusion; but Aga Mahommed, with extraordinary presence of mind, remained in his tent, and at the first appearance of dawn his "muezzin," or public crier, was ordered to call the faithful to morning prayer as usual. Astonished at this, the few Zend cavaliers, thinking that the whole army of Kajars had returned, fled with precipitation leaving the field in possession of Aga Mahommed. The successful Kajar then entered Shiraz, and promoted the traitor Hajji Ibrahim to be his vizier. Lutf 'Ali Khan took refuge with the hospitable chief of Tabbas in the heart of Khorasan, where he succeeded in collecting a few followers; but advancing into Fars, he was again defeated, and forced to take refuge at Kandahar.

Capture of Kermān. In 1794, however, the undaunted prince once more crossed the Persian frontier, determined to make a last effort, and either regain his throne or die in the attempt. He occupied the city of Kermān, then a flourishing commercial town, half-way between the Persian Gulf and the province of Khorasan. Aga Mahommed besieged it with a large army in 1795, and, after a stout resistance, the gates were opened through treachery. For three hours the gallant young warrior fought in the streets with determined valour, but in vain. When he saw that all hope was gone he, with only three followers, fought his way through the Kajar host and escaped to Bam-Narmashir, the most eastern district of the province of Kermān on the borders of Seistan.

Furious at the escape of his rival, the savage conqueror ordered a general massacre; 20,000 women and children were sold into slavery, and 70,000 eyes of the inhabitants of Kermān were brought to Aga Mahommed on a platter.

Lutf 'Ali Khan took refuge in the town of Bam; but the governor of Narmashir, anxious to propitiate the conqueror, basely surrounded him as he was mounting his faithful horse Kuran to seek a more secure asylum. The young prince fought bravely; but, being badly wounded and overpowered by numbers, he was secured and sent to the camp of the Kajar chief. The spot where he was seized at Bam, when mounting his horse, was marked by a pyramid, formed, by order of his revengeful enemy, of the skulls of the most faithful of his adherents. The most hideous indignities and atrocities were committed upon his person by the cruel Kajar, and finally he was sent to Teherān and murdered, when only in his twenty-sixth year. Every member of his family and every friend was ordered to be massacred by Aga Mahommed; and the successful miscreant thus founded the dynasty of the Kajars at the price of all the best and noblest blood of Iran.

The Zend is said to be a branch of the Lak tribe, dating from the time of the Kaianian kings, and claims to have been charged with the care of the *Zend-Avesta* by Zoroaster himself.[1] The tree attached to Markham's chapter on the dynasty contains the names of eight members of the family only, *i.e.* four brothers, one of whom had a son, grandson and great-grandson, and one a son. Four of the eight were murdered, one was blinded, and one cruelly mutilated. In one case a brother murdered a brother, in another an uncle blinded his nephew.

Kajar Dynasty.—Aga Mahommed was undoubtedly one of the most cruel and vindictive despots that ever disgraced a throne. But he was not without care for the honour of his empire in the eyes of Europe and the outer world, and his early career in Mazandaran gave him a deeply-rooted mistrust of Russia, with the officers of which power he was in constant contact. The following story, told by Forster,[2] and varied by a later writer, is characteristic. A party of Russians having obtained permission to build a "counting-house" at Ashraf, in the bay of that name, erected instead a fort with eighteen guns. Aga Mahommed, learning the particulars, visited the spot, expressed great pleasure at the work done, invited the officers to dine with him, imprisoned them, and only spared their lives when they had removed the whole of the cannon and razed the fort to the ground. This occurrence must have taken place about 1782. **Aga Mahommed.**

Forster was travelling homeward by the southern shores of the Caspian in January 1784, and from him we gather many interesting details of the locality and period. He calls Aga Mahommed chief of Mazandaran, as also of Astarabad and "some districts situate in Khurasan," and describes his tribe the Kajar, to be, like the Indian Rajput, usually devoted to the profession of arms. Whatever hold his father may have had on Gilan, it is certain that this province was not then in the son's possession, for his brother, Ji'afir Kuli, governor of Balfrush (Balfroosh), had made a recent incursion into it and driven Hidaiyat Khan, its ruler, from Resht to Enzeli, and Aga Mahommed was himself meditating another attack on the same quarter. The latter's palace was at Sari, then a small and partly fortified town, thickly inhabited, and with a plentifully-supplied market. As "the most powerful chief in Persia" since the death of Karim Khan, the Russians were seeking to put their yoke upon him.

As Aga Mahommed's power increased, his dislike and jealousy of the Muscovite assumed a more practical shape. His victory over Lutf 'Ali was immediately followed by an expedition into Georgia. After the death of Nadir the wali of that country had looked around him for the safest means of shaking off the yoke of Persia; and in course of time an opportunity had offered of a promising kind. In 1783, when the strength of the Persian monarchy was concentrated upon Isfahan and Shiraz, the Georgian tsar Heraclius entered into an agreement with the empress Catherine by which all connexion with the shah was disavowed, and a quasi-vassalage to Russia substituted—the said empire extending her aegis of protection over her new ally. Aga Mahommed now demanded that Heraclius should return to his position of tributary and vassal to Persia, and, as his demand was rejected, prepared for war. Dividing an army of 60,000 men into three corps, he sent one of these into Daghestan, another was to attack Erivan, and with the third he himself laid siege to Shusha in the province of Karabakh. The stubborn resistance offered at the last-named place caused him to leave there a small investing force only, and to move on with the remainder of his soldiers to join the *corps d'armée* at Erivan. Here, again, the difficulties presented caused him to repeat the same process and to effect a junction with his first corps at Ganja, the modern Elisavetpol. At this place he encountered the Georgian army under Heraclius, defeated it, and marched upon Tiflis, which he pillaged, massacring and enslaving[3] the inhabitants. Then he returned triumphant to Teherān, where (or at Ardebil on the way) he was publicly crowned shah of Persia. Erivan surrendered, but Shusha continued to hold out. These proceedings caused Russia to enter the field. Derbent was taken possession of by Imhov, Baku and Shumakhy were occupied and Gilan was threatened. The death of the empress, however, caused the issue of an order to retire, and Derbent and Baku remained the only trophies of the campaign. **Campaign against Georgia.**

In the meantime Aga Mahommed's attention had been called away to the east. Khorasan could hardly be called an integral part of the shah's kingdom so long as it was under even the nominal rule of the blind grandson of Nadir. But the eastern division of the province and its outlying parts were actually in the hands of the Afghans, and Meshed was not Persian in 1796 in the sense that Delhi was British at the outbreak of the Indian Mutiny. Shah Rukh held his position, such as it was, rather under Ahmad **Operations in Khorasan.**

[1] Markham. Morier says of Karim Khan's family, "it was a low branch of an obscure tribe in Kurdistan."

[2] *Journey from Bengal to England* (1798), ii. 201; see also Markham, pp. 341, 342.

[3] Lady Sheil says (1849): "I saw a few of these unhappy captives who all had to embrace Mahommedanism, and many of whom had risen to the highest stations, just as the Circassian slaves in Constantinople."

Shah and his successors in Afghanistan than under any other sovereign power. Aga Mahommed determined to restore the whole province to Persia, and, after a brief residence in Teherān on his return from the Georgian expedition, he set out for Meshed. It is important to note that on the occasion of his coronation he had girded on the sabre consecrated at the tomb of the founder of the Safawid—thus openly pledging himself to support the Shi'ite faith.

But there had been continual dissatisfaction in the capital of Khorasan, and constant inroads upon it from without, which the royal puppet was unable to prevent. His popularity was real, but never seemed to have effect outside the limited sphere of personal sympathy and regard. Owing to the frequent revolutions in the holy city the generals of Timur Shah, king of the Afghans, had made three expeditions on Shah Rukh's behalf. Meshed had been taken and retaken as though he were not a resident in it, much less its *de jure* king. Moreover, his two sons Nadir Mirza and Wali Ni'amat had long been fighting, and the former was in 1796 the actual ruler of the place. Three years before Timur had died, and his third son, Zaman Shah, hy the intrigues of an influential sirdar, Paiyanda Khan, had been proclaimed his successor at Kabul.

Aga Mahommed's entry into Meshed was effected without a struggle on the part of those in possession. The Kajar shah walked on foot to the tomb of Imam Riza, before which he knelt and kissed the ground in token of devotion, and was recognized as a Shi'ite of Shi'ites. Shah Rukh submissively followed in his train. Then began the last act of the local tragedy. The blind king's gradual revelation, under horrible torture, of the place of concealment of his several jewels and treasures, and his deportation and death (of the injuries thus received, at Damghan, en route to Mazandaran), must be classed among the darkest records of Oriental history.

From Meshed Aga Mahommed sent an envoy to Zaman Shah, asking for the cession of Balkh, and explaining his invasion of Khorasan; but the Afghan monarch was too perplexed with the troubles in his own country and his own insecure position to do more than send an unmeaning reply. It is not shown what was the understood boundary between the two countries at this particular period; but Watson states that on the shah's departure he had received the submission of the whole of Khorasān, and left in Meshed a garrison of 12,000 men.

Aga Mahommed had now fairly established his capital at Teherān. On his return thither in September 1796 he dismissed his troops for the winter, directing their reassembly in the following spring. The re-invasion by Russia of the provinces and districts he had recently wrested from her west of the Caspian had made great progress, but the circumstance does not seem to have changed his plans for the army. Although, when the spring arrived and the shah led his forces to the Aras, the Russians had, it is true, retreated, yet territory had been regained by them as far south as the Talysh. Aga Mahommed had now arrived at the close of his career. He was enabled, with some difficulty, to get his troops across the river, and take possession of Shusha, which had given them so much trouble a year or two before. There, in camp, he was murdered (1797) by his own personal attendants—men who were under sentence of death, but allowed to be at large. He was then fifty-seven years of age, and had ruled over part of Persia for more than eighteen years—over the kingdom generally for about three years, and from his coronation for about one year only.

Death and Character of Aga Mahommed.

The brutal treatment he had experienced in boyhood under the orders of 'Adil Shah, and the opprobrious name of "eunuch" with which he was taunted by his enemies, no doubt contributed to embitter his nature. His contempt of luxury, his avoidance of hyperbole and dislike of excessive ceremony, his protection to commerce and consideration for his soldiers, the reluctance with which he assumed the crown almost at the close of his reign—all these would have been praiseworthy in another man; but on his death the memory of his atrocious tyranny alone survived. Those who have seen his portrait once will recognize the face wherever presented. "Beardless and shrivelled," writes Sir John Malcolm, "it resembled that of an aged and wrinkled woman, and the expression of his countenance, at no time pleasant, was horrible when clouded, as it very often was, with indignation. He was sensible of this, and could not bear that any one should look at him."

Aga Mahommed had made up his mind that he should be succeeded by his nephew Fath 'Ali Shah, son of his full brother, Hosain Kuli Khan, governor of Fars. There was a short interval of confusion after the murder. The remains of the sovereign were exposed to insult, the army was disturbed, the recently captured fort on the left bank of the Aras was abandoned; but the wisdom and resolution of the minister, Hajji Ibrahim, and of Mirza Mahommed Khan Kajar secured order and acceptance of the duly appointed heir. The first, proclaiming his own allegiance, put himself at the head of a large body of troops and marched towards the capital. The second closed the gates of Teherān to all comers until Fath 'Ali Shah came himself from Shiraz. Though instantly proclaimed on arrival, the new monarch was not crowned until the spring of the following year (1798).

Fath Ali Shah.

The so-called rebellions which followed were many, but not of any magnitude. Such as belong to local history are three in number, *i.e.* that of Sadik Khan Shakaki, the general whose possession of the crown jewels enabled him, after the defeat of his army at Kazvin, to secure his personal safety and obtain a government; of Hosain Kuli Khan, the shah's brother, which was compromised by the mother's intervention; and of Mahommed, son of Zaki Khan, Zend, who was defeated on more than one occasion in battle, and fled into Turkish territory. Later, Sadik Khan, having again incurred the royal displeasure, was seized, confined and mercilessly bricked up in his dungeon to die of starvation.

Rebellions.

Another adversary presented himself in the person of Nadir Mirza, son of Shah Rukh, who, when Aga Mahommed appeared before Meshed, had taken refuge with the Afghans. Fath 'Ali sent to warn him of the consequences, but without the desired effect. Finally, he advanced into Khorasan with an army which appears to have met with no opposition save at Nishapur and Turbet, both of which places were taken, and when it reached Meshed, Nadir Mirza tendered his submission, which was accepted. Peace having been further cemented by an alliance between a Kajar general and the prince's daughter, the shah returned to Teherān.

Now that the narrative of Persian kings has been brought up to the period of the consolidation of the Kajar dynasty and commencement of the 19th century, there remains but to summarize the principal events in the reigns of Fath 'Ali Shah and his immediate successors, Mahommed Shah and Nasru 'd-Din Shah.

Fath 'Ali Shah came to the throne at about thirty-two years of age, and died at sixty-eight, after a reign of thirty-six years. Persia's great aim was to recover in the north-west, as in the north-east of her empire, the geographical limits obtained for her by the Safawid kings; and this was no easy matter when she had to contend with a strong European power whose territorial limits touched her own. Fath 'Ali Shah undertook, at the outset of his reign, a contest with Russia on the western side of the Caspian, which became constant and harassing warfare. Georgia was, clearly, not to revert to a Mahommedan suzerain. In 1800 its tsar, George, son and successor of Heraclius, notwithstanding his former professions of allegiance to the shah, renounced his crown in favour of the Russian emperor. His brother Alexander indignantly repudiated the act and resisted its fulfilment, but he was defeated by General Lazerov on the banks of the Lora. Persia then re-entered the field. Among the more notable occurrences which followed were a three days' battle, fought near Echmiadzin, between the crown prince, 'Abbas Mirza, and General Zizianov, in which the Persians suffered much from the enemy's artillery, but would not admit they were defeated; unsuccessful attempts on the part of the Russian commander to get possession of Erivan; and a surprise, in camp, of the shah's forces, which caused them to disperse, and necessitated the king's own presence with reinforcements. On the latter occasion the shah is credited with gallantly swimming his horse across the Aras, and setting an example of energy and valour. In the following year 'Abbas Mirza advanced upon Shishah, the chief of which place and of the Karabagh had declared for Russia; much fighting ensued, and Erivan was formally taken possession of in the name of

War with Russia.

the shah. The Russians, moreover, made a futile attempt on Gilan by landing troops at Enzeli, which returned to Baku, where Zizianov fell a victim to the treachery of the Persian governor. Somewhat later Ibrahim Khalil of Shusha, repenting of his Russophilism, determined to deliver up the Muscovite garrison at that place, but his plans were betrayed, and he and his relatives put to death. Reprisals and engagements followed with varied success; and the crown prince of Persia, after a demonstration in Shirvan, returned to Tabriz. He had practically made no progress; yet Russia, in securing possession of Derbent, Baku, Shirvan, Sheki, Ganja, the Talysh and Mugan, was probably indebted to gold as well as to the force of arms. At the same time Persia would not listen to the overtures of peace made to her by the governor-general who had succeeded Zizianov.

Relations with England, India and France.

Relations had now commenced with England and British India. A certain Mahdi 'Ali Khan had landed at Bushire, entrusted by the governor of Bombay with a letter to the shah, and he was followed shortly by an English envoy from the governor-general, Captain Malcolm of the Madras army. He had not only to talk about the Afghans but about the French, and the trade of the Persian Gulf. The results were a political and commercial treaty, and a return mission to India from Fath 'Ali Shah. To him France next sent her message. In 1801 an Armenian merchant from Bagdad had appeared as the bearer of credentials from Napoleon, but his mission was mistrusted and came to nothing. Some five years afterwards Jaubert, after detention and imprisonment on the road, arrived at Teherān and went back to Europe with a duly accredited Persian ambassador, who concluded a treaty with the French emperor at Finkenstein. On the return of the Persian diplomatist, a mission of many officers under General Gardane to instruct and drill the local army was sent from France to Persia. Hence arose the counter-mission of Sir Harford Jones from the British government, which, on arrival at Bombay in April 1808, found that it had been anticipated by a previously sent mission from the governor-general of India, under Malcolm again, then holding the rank of brigadier-general.

The home mission, however, proceeded to Bushire, and Malcolm's return thence to India enabled Sir Harford to move on and reach the capital in February 1809. A few days before his entry General Gardane had been dismissed, as the peace of Tilsit debarred France from aiding the shah against Russia. Sir Harford concluded a treaty with Persia the month after his arrival at the capital; but the government of India were not content to leave matters in his hands: notwithstanding the anomaly of a double mission, Malcolm was in 1810 again despatched as their own particular envoy. He brought with him Captains Lindsay and Christie to assist the Persians in the war, and presented the shah with some serviceable field-pieces; but there was little occasion for the exercise of his diplomatic ability save in his non-official intercourse with the people, and here he availed himself of it to the great advantage of himself and his country.[1] He was welcomed by the shah in camp at Ujani, and took leave a month afterwards to return via Bagdad and Basra to India. The next year Sir Harford Jones was relieved as envoy by Sir Gore Ouseley.

Renewal of Russian War.

Meanwhile hostilities had been resumed with Russia, and in 1812 the British envoy used his good offices for the restoration of peace, but the endeavour failed. To add to the Persian difficulty, in July of this year a treaty was concluded between England and Russia, and this circumstance caused the envoy to direct that British officers should take no further part in Russo-Persian military operations. Christie and Lindsay, however, resolved to remain at their own risk, and advanced with the Persian army to the Aras. On the 31st of October the force was surprised by an attack of the enemy, and retreated; the next night they were again attacked and routed at Aslanduz. Christie fell bravely fighting at the head of his brigade; Lindsay saved two of his nine guns; but neither of the two Englishmen was responsible for the disaster. Lenkoran was taken by Persia, but retaken by Russia during the next three months; and on the 13th of October 1813, through Sir Gore Ouseley's intervention, the Treaty of Gulistan put an end to the war. Persia formally ceded Georgia and the seven provinces before named, with Karabakh.

On the death of the emperor Alexander in December 1825 Prince Menshikov was sent to Teherān to settle a dispute which had arisen between the two governments regarding the prescribed frontier. But, as the claim of Persia to a particular district then occupied by Russia could not be admitted, the special envoy was given his *congé*, and war was recommenced. The chief of Talysh struck the first blow, and drove the enemy from Lenkoran. The Persians then carried all before them; and the hereditary chiefs of Shirvan, Sheki and Baku returned from exile to co-operate with the shah's general in the south. In the course of three weeks the only advanced post held by the governor-general of the Caucasus was the obstinate little fortress of Shusha. But before long all was again changed. Hearing that a Russian force of some 9000 men was concentrated at Tiflis, Mahommed Mirza, son of the crown prince, advanced to meet them on the banks of the Zezam. He was defeated; and his father was routed more seriously still at Ganja. The shah made great efforts to renew the war; but divisions took place in his son's camp, not conducive to successful operations, and new proposals of peace were made. But Russia demanded Erivan and Nakhichevan as well as the cost of the war; and in 1827 the campaign was reopened. Briefly, after successive gains and losses, not only Erivan was taken from Persia but Tabriz also, and finally, through the intervention of Sir John Macdonald, the English envoy, a new treaty was concluded at Turkmanchai, laying down the boundary between Russia and Persia. Among the hard conditions for the latter country were the cession in perpetuity of the khanates of Erivan and Nakhichevan, the inability to have an armed vessel in the Caspian, and the payment of a war indemnity of some £3,000,000.

War with Turkey.

After Russia, the neighbouring state next in importance to the well-being of Persia was Turkey, with whom she was united on the west by a common line of frontier. Selim had not scrupled, in 1804 and 1805, to allow the Russians to make free use of the south-eastern coasts of the Black Sea, to facilitate operations against the shah's troops; and there had been a passage of arms between the king's eldest son, Mahommed 'Ali Mirza, and Suleiman Pasha, son-in-law of the governor-general of Bagdad, which is locally credited as a battle won by the former. But there was no open rupture between the two sovereigns until 1821, when the frontier disputes and complaints of Persian travellers, merchants and pilgrims culminated in a declaration of war. This made 'Abbas Mirza at once seize upon the fortified places of Toprak Kal'ah and Ak Sarai within the limits of the Ottoman Empire, and, overcoming the insufficient force sent against him, he was further enabled to extend his inroads to Mush, Bitlis, and other known localities. The Turkish government retaliated by a counter-invasion of the Persian frontier on the south. At that time the Pasha of Bagdad was in command of the troops. He was defeated by Mahommed 'Ali Mirza, then prince-governor of Kermanshah, who drove his adversary back towards his capital and advanced to its immediate environs. Being attacked with cholera, however, the Persian commander recrossed the frontier, but only to succumb to the disease in the pass of Kirind. In the sequel a kind of desultory warfare appears to have been prosecuted on the Persian side of Kurdistan, and the shah himself came down with an army to Hamadan. Cholera broke out in the royal camp and caused the troops to disperse.

In the north the progress of 'Abbas Mirza was stopped at Bayazid by a like deadly visitation; and a suspension of hostilities was agreed upon for the winter season. At the expiration of four months the sirdar of Erivan took possession of a Turkish military station on the road to Erzerum, and the crown prince marched upon that city at the head of 30,000 men. The Ottoman army which met him is said to have numbered some 52,000; but victory was on the side of their opponents. Whether the result was owing to the defection of 15,000 Kurds or not the evidence adduced is insufficient to decide. In the English records of the period it is stated that the defeat of the Turks was complete.

Profiting from this victory, 'Abbas Mirza repeated an offer of peace before made without avail to the pasha of Erzerum; and, in order to conciliate him more effectually, he retired within the old limits of the dominions of the shah, his father. But more troubles arose at Bagdad, and other reasons intervened to protract negotiations for a year and a half. At length, in July 1823, the Treaty of Erzerum closed the war between Turkey and Persia. It provided especially against a recurrence of the proved causes of war, such as extorting taxes from Persian travellers or pilgrims, disrespect to the ladies of the royal harem and other ladies of rank proceeding to Mecca or Karbala (Kerbela), irregular levies of custom-duties, non-punishment of Kurdish depredators transgressing the boundary, and the like.

The Afghan Question.

With respect to the eastern boundaries of his kingdom, Fath 'Ali Shah was fortunate in having to deal with a less dangerous neighbour than the Muscovite of persistent policy and the Turk of precarious friendship. The Afghan, though equal to the Persian in physical force and prowess, was his inferior in worldly knowledge and experience. Moreover, the family divisions among the ruling houses of Afghanistan grew from day to day more destructive to that patriotism and sense of nationality which Ahmad Shah had held out to his countrymen as the sole specifics for becoming a strong people.

The revolt of Nadir Mirza had, as before explained, drawn the shah's attention to Khorasan in the early part of his reign; but, although quiet had for the moment been restored at Meshed by the presence of the royal camp, fresh grounds of complaint were urged against the rash but powerless prince, and recourse was had to extreme measures. Charged with the murder of a holy saiyid, his hands were cut off and his tongue was plucked out, as part of the horrible punishment inflicted on him. It does not appear that Nadir Mirza's cause was ever seriously espoused by the Afghans

---

[1] The "wakiln 'l-mulk," governor of Kerman, told Colonel Goldsmid, when his guest in 1866, that "his father had been Sir John Malcolm's *Mihmandar*. There never was such a man as 'Malcolm Sahib.' Not only was he generous on the part of his government, but with his own money also."—(*Telegraph and Travel*, p. 585.)

nor that Fath 'Ali Shah's claim to Meshed, as belonging to the Persian crown, was actively resisted. But the large province of Khorasan, of which Meshed was the capital, had never been other than a nominal dependency of the crown since the death of Nadir; and in the autumn of 1830 the shah, under Russian advice, assembled a large force to bring into subjection all turbulent and refractory chiefs on the east of his kingdom. Yezd and Kerman were the first points of attack; Khorasan was afterwards entered by Samnan, or the main road from Teherān. The expedition, led by 'Abbas Mirza, involved some hard fighting and much loss of life; several forts and places were captured, among them Kuchan and Serrakhs; and it may be concluded that the objects contemplated were more or less attained. An English officer, Colonel Shee, commanded what was called the "British detachment" which accompanied the prince. Thus far as regards Yezd, Kerman and Khorasan. It was otherwise with Herat.

Hajji Firuzu'd-Din, son of Timur Shah, reigned undisturbed in that city from 1800 to 1816. Since Fath 'Ali Shah's accession he and his brother Mahmud had been, as it were, under Persian protection. Persia claimed the principality of Herat as part of the empire of Nadir, but her pretensions had been satisfied by payments of tribute or evasive replies. Now, however, that she marched her army against the place, Firuzu 'd-Din called in the aid of his brother Mahmud Shah of Kabul, who sent to him the famous vizier, Fath Khan Barakzai. The latter, intriguing on his own account, got possession of the town and citadel; he then sallied forth, engaged the Persian forces, and forced them to retire into their own country. In 1824, on a solicitation from Mustafa Khan, who had got temporary hold of Herat, more troops were despatched thither, but, by the use of money or bribes, their departure was purchased. Some eight or nine years afterwards 'Abbas Mirza, when at the head of his army in Meshed, invited Yar Mahommed Khan of Herat to discuss a settlement of differences between the two governments. The meeting was unproductive of good. Again the Persian troops advanced to Herat itself under the command of Mahommed Mirza, son of 'Abbas; but the news of his father's death caused the commander to break up his camp and return to Meshed.

Sir Gore Ouseley returned to England in 1814, in which year Mr Ellis, assisted by Mr Morier—whose "Hajji Baba" is the unfailing proof of his ability and deep knowledge of Persian character—negotiated on the part of Great Britain the Treaty of Teherān. England was to provide troops or a subsidy in the event of unprovoked invasion, while Persia was to attack the Afghans should they invade India. Captain Willock succeeded Morier as chargé d'affaires in 1815, and since that period Great Britain has always been represented at the Persian court. It was in Fath 'Ali Shah's reign that Henry Martyn was in Persia, and completed his able translation of the New Testament into the language of that country. Little more remains to be here narrated of the days of Fath 'Ali Shah. Among the remarkable occurrences may be noted the murder at Teherān in 1828 of M. Grebayadov, the Russian envoy, whose conduct in forcibly retaining two women of Erivan provoked the interference of the mullas and people. To repair the evil consequences of this act a conciliatory embassy, consisting of a young son of the crown prince and some high officers of the state, was despatched to St Petersburg. Shortly afterwards the alliance with Russia was strengthened, and that with England slackened in proportion.

Fath 'Ali Shah had a numerons family. Agreeably to the Persian custom, asserted by his predecessors, of nominating the heir-apparent from the sons of the sovereign without restriction to seniority, he had passed over the eldest, Mahommed 'Ali, in favour of a junior, 'Abbas; but, as the nominee died in the lifetime of his father, the old king had proclaimed Mahommed Mirza, the son of 'Abbas, and his own grandson, to be his successor. Why a younger son had been originally selected, to the prejudice of his elder brother, is differently stated by different writers. The true reason was probably the superior rank of his mother.

Mahommed Shah.

Mahommed Shah was twenty-eight years old when he came to the throne in 1834. He died at the age of forty-two, after a reign of about thirteen and a half years. His accession was not publicly notified for some months after his grandfather's death, for it was necessary to clear the way of all competitors, and there were two on this occasion—one 'Ali Mirza, governor of Teherān, who actually assnmed a royal title, and one Hasan 'Ali Mirza, governor of Shiraz. Owing to the steps taken by the British envoy, Sir John Campbell, assisted by Colonel Bethune, at the head of a considerable force, supplied with artillery, the opposition of the first was neutralized, and Mahommed Shah, entering Teherān on the 2nd of January, was proclaimed king on the 31st of the same month. It cost more time and trouble to bring the second to book. Hasan 'Ali, "farman-farma," or commander-in-chief, and his brother and abettor, had an army at their disposal in Fars. Sir Henry Lindsay Bethune marched his soldiers to Isfahan to be ready to meet them. An engagement which took place near Kumishah, on the road between Isfahan and Shiraz, having been successful, the English commander pushed on to the latter town, where the two rebel princes were seized and imprisoned. Forwarded under escort to Teherān, they were, according to Watson, ordered to be sent on thence as state prisoners to Ardebil, but the farman-farma died on the way, and his brother was blinded before incarceration. Markham, however, states that both 'Ali Mirza and Hasan 'Ali were allowed to retire with a small pension, and that no atrocities stained the beginning of the reign of Mahommed Shah. It is presumed that the fate of the prime minister or "kaim-makam," who was strangled in prison, was no more than an ordinary execution of the law. This event, and the prevalence of plague and cholera at Teherān, marked somewhat gloomily the now monarch's first year.

The selection of a premier was one of the first weighty questions for solution. A member of the royal family, the "asafu 'd-daula," governor of Khorasan, left his government to urge his candidature for the post. The king's choice, however, fell on Hajji Mirza Aghasi, a native of Erivan, who in former years, as tutor to the sons of 'Abbas Mirza, had gained a certain reputation for learning and a smattering of the occult sciences, but whose qualifications for statesmanship were craftiness and suspicion. As might have been anticipated, the hajji fell into the hands of Russia, represented by Count Simonich, who urged him to a fresh expedition into Khorasan and the siege of Herat. There was no doubt a plausible pretext for both proposals. The chiefs, reduced to temporary submission by 'Abbas Mirza, had again revolted; and Shah Kamran, supported by his vizier, Yar Mahommed, had broken those engagements and pledges on the strength of which Fath 'Ali Shah had withdrawn his troops. In addition to these causes of offence he had appropriated the province of Seistan, over which Persia had long professed to hold the rights of suzerainty. But the king's ambition was to go farther than retaliation or chastisement. He refused to acknowledge any right to separate government whatever on the part of the Afghans, and Kandahar and Ghazni were to be recovered, as belonging to the empire of the Safawid dynasty. The advice of the British envoy was dissuasive in this respect, and therefore distasteful.

Expedition against Herat.

Sir John Campbell, in less than a year after the sovereign's installation, went home, and was succeeded as British envoy by Henry Ellis. The change in personnel signified also a transfer of superintendence of the Persian legation, which passed from the government in India to the authorities in England. The expedition was to commence with a campaign against the Turcomans—Herat being its later destination. Such counter-proposals as Ellis had suggested for consideration had been politely put aside, and the case was now more than ever complicated by the action of the Barakzai chiefs of Kandahar, who had sent a mission to Teherān to offer assistance against their Saduzai rival at Herat. Fresh provocation had, moreover, been given to the shah's government by the rash and incapable Kamran.

About the close of the summer the force moved from Teherān. The royal camp was near Astarabad in November 1836. Food was scarce: barley sold for ten times the usual price, and wheat was not procurable for any money. The troops were dissatisfied, and, being kept without pay and on short rations, took to plundering. There had been operations on the banks of the Gurgan, and the Turcomans had been driven from one of their strongholds; but little or no progress had been made in the subjection of these marauders, and the Heratis had sent word that all they could do was to pay tribute, and, if that were insufficient, the shah had better march to Herat. A military council was held at Shahrud, when it was decided to return to the capital and set out again in the spring. Accordingly the troops dispersed, and the sovereign's presence at Teherān was taken advantage of by the British minister to renew his attempts in the cause of peace. Although on the present occasion Simonich ostensibly aided the British chargé d'affaires M'Neill, who had succeeded Ellis in 1836, no argument was of any avail to divert the monarch from his purpose. He again set out in the summer, and, invading the Herat territory in November 1837, began the siege on the 23rd of that month.

Siege of Herat.

Not until September in the following year did the Persian army withdraw from before the walls of the city; and then the movement only took place on the action of the British government. M'Neill, who had joined the Persian camp on the 6th of April, left it again on the 7th of June. He had done all in his power to effect a reasonable agreement between the contending parties; but both in this respect and in the matter of a commercial treaty with England, then under negotiation, his efforts had been met with evasion and latent hostility. The Russian envoy, who had appeared among the tents of the besieging army almost simultaneously with his English colleague, no sooner found himself alone in his diplomacy than he resumed his aggressive counsels, and little more than a fortnight had clapsed since M'Neill's departure when a vigorous assault, planned, it is asserted, by Simonich himself, was made upon Herat. The Persians attacked at five points, at one of which they would in all likelihood have been successful had not the Afghans been aided by Eldred Pottinger, a young Englishman, who with the science of an artillery officer combined a courage and determination which inevitably influenced his subordinates. Still the garrison was disheartened; but Colonel Stoddart's arrival on the 11th of August to threaten the shah with British intervention put a stop to further action. Colonel Stoddart's refusal to allow any but British mediators to decide the pending dispute won the day; and that officer was able to report that on

the 9th of September Mahommed Shah had "mounted his horse" and gone from before the walls of the beleaguered city.

The siege of Herat, which lasted for nearly ten months, was the great event in the reign of Mahommed Shah. The British expedition in support of Shah Shuj'a, which may be called its natural consequence, involves a question foreign to the present narrative.

The remainder of the king's reign was marked by new difficulties with the British government; the rebellion of Aga Khan Mahlati otherwise known as the chief of the Assassins; a new rupture with Turkey; the banishment of the asafu 'd-daula, governor of Khorasan, followed by the insurrection and defeat of his son; and the rise of Bâbîism (*q.v.*). The first of these only calls for any detailed account.

Difficulty with England. In the demands of the British Government was included the cession by Persia of places such as Farah and Sabzowar, which had been taken during the war from the Afghans, as well as reparation for the violence offered to the courier of the British legation. M'Neill gave a certain time for decision, at the end of which, no satisfactory reply having reached him, he broke off diplomatic relations, ordered the British officers lent to the shah to proceed towards Bagdad *en route* to India, and retired to Erzerum with the members of his mission. On the Persian side, charges were made against M'Neill, and a special envoy was sent to England to support them. An endeavour was at the same time made to interest the cabinets of Europe in influencing the British government on behalf of Persia. The envoy managed to obtain an interview with the minister of foreign affairs in London, who, in July 1839, supplied him with a statement, fuller than before, of all English demands upon his country. Considerable delay ensued, but the outcome of the whole proceedings was not only acceptance but fulfilment of all the engagements contracted. In the meantime the island of Kharak had been taken possession of by an expedition from India.

On the 11th of October 1841 a new mission arrived at Teherān from London, under John (afterwards Sir John) M'Neill, to renew diplomatic relations. It was most cordially received by the shah, and as one of its immediate results, Kharak was evacuated by the British-Indian troops.

There had been a long diplomatic correspondence in Europe on the proceedings of Count Simonich and other Russian officers at Herat. Among the papers is a very important letter from Count Nesselrode to Count Pozzo di Borgo in which Russia declares herself to be the first to counsel the shah to acquiesce in the demand made upon him, because she found "justice on the side of England" and "wrong on the side of Persia." She withdrew her agent from Kandahar and would "not have with the Afghans any relations but those of commerce, and in no wise any political interests."

Aga Khan's rebellion was fostered by the defection to his cause of a large portion of the force sent against him; but he yielded at last to the local authorities of Kerman and fled the province and country. He afterwards resided many years at Bombay, where, while maintaining among natives a quasi-spiritual character, he was better known among Europeans for his doings on the turf.

The quarrel with Turkey was generally about frontier relations. Eventually the matter was referred to an Anglo-Russian commission, of which Colonel Williams (afterwards Sir Fenwick Williams of Kars) was president. A massacre of Persians at Kerbela might have seriously complicated the dispute, but, after a first burst of indignation and call for vengeance, an expression of the regret of the Ottoman government was accepted as a sufficient apology for the occurrence.

The rebellion of the asafu 'd-daula, maternal uncle of the shah, was punished by exile, while his son, after giving trouble to his opponents, and once gaining a victory over them, took shelter with the Turcomans.

Before closing the reign of Mahommed Shah note should be taken of a prohibition to import African slaves into Persia, and a commercial treaty with England—recorded by Watson as gratifying achievements of the period by British diplomatists. The French missions in which occur the names of MM. de Lavalette and de Sartiges were notable in their way, but somewhat barren of results.

In the autumn of 1848 the shah was seized with the malady, or combination of maladies, which caused his death. Gout and erysipelas had, it is said,[1] ruined his constitution, and he died at his palace in Shimran on the 4th of September. He was buried at Kum, where is situated the shrine of Fatima, daughter of Imam Riza, by the side of his grandfather, Fath 'Ali, and other kings of Persia. In person he is described as short and fat, with an aquiline nose and agreeable countenance.[2]

Nasru 'd-Din Shah. On the occasion of his father's death, Nasru 'd-Din Mirza, who had been proclaimed wali 'ahd, or heir-apparent, some years before, was absent at Tabriz, the headquarters of his province of Azerbaijan. Colonel Farrant, then chargé d'affaires on the part of the British government, in the absence of Colonel Sheil, who had succeeded Sir John M'Neill, had, in anticipation of the shah's decease and consequent trouble, sent a messenger to summon him instantly to Teherān. The British officer, moreover, associated himself with Prince Dolgoruki, the representative of Russia, to secure the young prince's accession.

[1] Watson. [2] Markham.

The queen mother, as president of the council, showed much judgment and capacity in conciliating adverse parties. But the six or seven weeks which passed between the death of the one king and the coronation of the other proved a disturbed interval, and full of stirring incident. The old minister, Hajji Mirza Aghasi, shut himself up in the royal palace with 1200 followers, and had to take refuge in the sanctuary of Shah 'Abdul-'Azim near Teherān. On the other hand Mirza Aga Khan, a partisan of the asafu 'd-daula, and himself an ex-minister of war, whom the hajji had caused to be banished, was welcomed back to the capital. At Isafahan, Shiraz and Kerman serious riots took place, which were with difficulty suppressed. While revolution prevailed in the city, robbery was rife in the province of Yezd; and from Kazvin the son of 'Ali Mirza otherwise called the "zillu's-sultan," the prince-governor of Teherān, who disputed the succession of Mahommed Shah, came forth to contest the crown with his cousin, the heir-apparent. The last-named incident soon came to an inglorious termination for its hero. But a more serious revolt was in full force at Meshed when, on the 20th of October 1848, the young shah entered his capital and was crowned at midnight king of Persia.

The chief events in the long reign of Nasru 'd-Din, fall under four heads: (1) the insurrection in Khorasan, (2) the insurrection of the Babis, (3) the fall of the amiru 'n-nizam, and (4) the war with England.

Insurrection in Khorasan. It has been stated that the asafu 'd-daula was a competitor with Hajji Mirza Aghasi for the post of premier in the cabinet of Mahommed Shah, that he was afterwards, in the same reign, exiled for rising in rebellion, and that his son, the salar, took shelter with the Turcomans. Some four months prior to the Mahommed Shah's decease the latter chief had reappeared in arms against his authority; he had gained possession of Meshed itself, driving the prince-governor, Hamza Mirza, into the citadel; and so firm was his attitude that Yar Mahommed of Herat, who had come to help the government officials, had retired after a fruitless co-operation, drawing away the prince-governor also. The salar now defied Murad Mirza, Nasru 'd-Din's uncle, who was besieging the city. In April 1850, after a siege of more than eighteen months, fortune turned against the bold insurgent, and negotiations were opened for the surrender of the town and citadel. Treachery may have had to do with the result, for when the shah's troops entered the holy city the salar sought refuge in the mosque of Imam Riza, and was forcibly expelled. He and his brother were seized and put to death, the instrument used being, according to Watson, "the bowstring of Eastern story." The conqueror of Meshed, Murad Mirza, became afterwards himself the prince-governor of Khorasan.

Babiism. In the article on Babiism, the facts as to the life of the *Bab*, Mirza Ali Mahommed of Shiraz, and the progress of the Babiist movement, are separately noticed. The Bab himself was executed in 1850, but only after serious trouble over the new religious propaganda; and his followers kept up the revolutionary propaganda.

In the summer of 1852 the shah was attacked, while riding in the vicinity of Teherān, by four Babis, one of whom fired a pistol and slightly wounded him. This man was killed, and two others were captured by the royal attendants; the fourth jumped down a well. The existence of a conspiracy was then discovered in which some forty persons were implicated; and ten of the conspirators were put to death—some under cruel torture.

Fall of Mirza Taki. Mirza Taki, the amiru 'n-nizam (vulgarly amir nizam), or commander-in-chief, was a good specimen of the self-made man of Persia. He was the son of a cook of Bahram Mirza, Mahommed Shah's brother, and he had filled high and important offices of state and amassed much wealth when he was made by the young shah Nasru 'd-Din, on his accession, both his brother-in-law and his prime-minister. The choice was an admirable one; he was honest, hard-working, and liberal according to his lights; and the services of a loyal and capable adviser were secured for the new régime. Unfortunately, he did not boast the confidence of the queen-mother; and this circumstance greatly strengthened the hands of those enemies whom an honest minister must ever raise around him in a corrupt Oriental state. For a time the shah closed his eyes to the accusations and insinuations against him; but at last he fell under the evil influence of designing counsellors, and acts which should have redounded to the minister's credit became the charges on which he lost his office and his life. He was credited with an intention to grasp in his own hands the royal power; his influence over the army was cited as a cause of danger; and on the night of the 13th of November 1851 he was summoned to the palace and informed that he was no longer premier. Mirza Aga Khan, the "'itimadu 'd-daulah," was named to succeed him, and had been accordingly raised to the dignity of "sadr'azim." As the hostile faction pressed the necessity of the ex-minister's removal from the capital, he was offered the choice of the government of Fars, Isfahan or Kum. He declined all; but, through the mediation of Colonel Sheil, he was afterwards offered and accepted Kashan. Forty days after his departure an order for his execution was signed, but he anticipated his fate by committing suicide.

When England was engaged in the Crimean War of 1854–55 her alliance with a Mahommedan power in no way added to her

popularity or strengthened her position in Persia. The Sunnite Turk was almost a greater enemy to his neighbour the Shi'ite than the formidable Muscovite, who had curtailed him of so large a section of his territory west of the Caspian. Since Sir John M'Neill's arrival in Teherān in 1841, formally to repair the breach with Mahommed Shah, there had been little differences, demands and explanations, and these symptoms had culminated in 1856, the year of the peace with Russia. As to Afghanistan, the vizier Yar Mahommed had in 1842, when the British troops were perishing in the passes, or otherwise in the midst of dangers, caused Kamran to be suffocated in his prison. Since that event he had himself reigned supreme in Herat, and, dying in 1851, was succeeded by his son Sa'id Mahommed. This chief soon entered upon a series of intrigues in the Persian interests, and, among other acts offensive to Great Britain, suffered one 'Abbas Kuli, who had, under guise of friendship, betrayed the cause of the salar at Meshed, to occupy the citadel of Herat, and again place a detachment of the shah's troops in Ghurian. Colonel Sheil remonstrated, and obtained a new engagement of non-interference with Herat from the Persian government, as well as the recall of 'Abbas Kuli. In September 1855 Mahommed Yusuf Saduzal seized upon Herat, putting Sa'id Mahommed to death with some of his followers who were supposed accomplices in the murder of his uncle Kamran. About this time Kohan Dil Khan, one of the chiefs of Kandahar, died, and Dost Mahommed of Kabul annexed the city to his territory. Some relations of the deceased chief made their escape to Teherān, and the shah, listening to their complaint, directed the prince-governor of Meshed to march across to the eastern frontier and occupy Herat, declaring that an invasion of Persia was imminent. Negotiations were useless, and on the 1st of November 1856 war against Persia was declared.

Rupture with England.

In less than three weeks after its issue by proclamation of the governor-general of India, the Sind division of the field force left Karachi. On the 13th of January following the Bombay government orders notified the formation of a second division under Lieut.-General Sir James Outram. Before the general arrived the island of Kharak and port of Bushire had both been occupied, and the fort of Rishir had been attacked and carried. After the general's arrival the march upon Borazjan and the engagement at Khushab—two places on the road to Shiraz—and the operations at Muhamrah and the Karun River decided the campaign in favour of England. On the 5th of April, at Muhamrah, Sir James Outram received the news that the treaty of peace had been signed in Paris, where Lord Cowley and Farrukh Khan had conducted the negotiations. The stipulations regarding Herat were much as before; but there were to be apologies made to the mission for past insolence and rudeness, and the slave trade was to be suppressed in the Persian Gulf. With the exception of a small force retained at Bushire under General John Jacob for the three months assigned for execution of the ratifications and giving effect to certain stipulations of the treaty with regard to Afghanistan, the British troops returned to India, where their presence was greatly needed, owing to the outbreak of the Mutiny.

The question of constructing a telegraph in Persia as a link in the overland line to connect England with India was broached in Teherān by Colonel Patrick Stewart and Captain Champain, officers of engineers, in 1862, and an agreement on the subject concluded by Edward Eastwick, when chargé d'affaires, at the close of that year. Three years later a more formal convention, including a second wire, was signed by the British envoy Charles Alison and the Persian foreign minister; meantime the work had been actively carried on, and communication opened on the one side between Bushire and Karachi and the Makran coast by cable, and on the other between Bushire and Bagdad via Teherān. The untrustworthy character of the line through Asiatic Turkey caused a subsequent change of direction; and an alternative line—the Indo-European—from London to Teherān, through Russia and along the eastern shores of the Black Sea, was constructed, and has worked well since 1872, in conjunction with the Persian land telegraph system and the Bushire-Karachi line.

Anglo-Indian Telegraph Line.

The Seistan mission, under Major-General (afterwards Sir Frederic) Goldsmid, left England in August 1870, and reached Teherān on the 3rd of October. Thence it proceeded to Isfahan, from which city it moved to Baluchistan, instead of seeking its original destination. Difficulties had arisen both in arranging the preliminaries to arbitration and owing to the disordered state of Afghanistan, and it was therefore deemed advisable to commence operations by settling a frontier dispute between Persia and the Kalat state. Unfortunately, the obstructions thrown in the way of this settlement by the Persian commissioner, the untoward appearance at Bampur of an unexpected body of Kalatis, and the absence of definite instructions marred the fulfilment of the programme sketched out; but a line of boundary was proposed, which was afterwards accepted by the litigants. In the following year the same mission, accompanied by the same Persian commissioner, proceeded to Seistan, where it remained for more than five weeks, prosecuting its inquiries, until joined by another mission from India, under Major-General (afterwards Sir Richard) Pollock, accompanying the Afghan commissioner. Complications then ensued by the determined refusal of the two native officials to meet in conference; and the arbitrator had no course available but to take advantage of the notes already obtained on the spot, and return with them to Teherān, there to deliver his decision. This was done on the 19th of August 1872. The contending parties appealed to the British secretary of state for foreign affairs, as provided by previous understanding; but the decision held good, and was eventually accepted on both sides.

Nasru 'd-Din Shah, unlike his predecessors, visited Europe—in 1873 and in 1879. On the first occasion only he extended his journey to England, and was then attended by his "sadr 'azim," or prime minister, Mirza Husain Khan, an able and enlightened adviser, and a Grand Cross of the Star of India. His second visit was to Russia, Germany, France and Austria, but he did not cross the Channel. (F. J. G.; X.)

E.—*Persia from 1884 to 1901.*

In 1865 the shah had mooted the idea of a Persian naval flotilla in the Persian Gulf, to consist of two or three steamers manned by Arabs and commanded by English naval officers; but the idea was discountenanced by the British government, to whom it was known that the project really concealed aggressive designs upon the independence of the islands and pearl fisheries of Bahrein (Curzon, *Persia*, ii. 294). Fifteen or sixteen years later it was repeatedly pointed out to the authorities that the revenues from the customs of the Persian Gulf would be much increased if control were exercised at all the ports, particularly the small ones where smuggling was being carried on on a large scale, and in 1883 the shah decided upon the acquisition of four or five steamers, one to be purchased yearly, and instructed the late 'Ali Kuli Khan, Mukhber ad-daulah, minister of telegraphs, to obtain designs and estimates from British and German firms. The tender of a well-known German firm at Bremerhaven was finally accepted, and one of the minister's sons then residing in Berlin made the necessary contracts for the first steamer. Sir Ronald Thomson, the British representative in Persia, having at the same time induced the shah to consider the advantages to Persia of opening the Karun River and connecting it with Teherān by a carriageable road, a small river steamer for controlling the shipping on the Karun was ordered as well, and the construction of the road was decided upon. Two steamers, the "Susa" and the "Persepolis," were completed in January 1885 at a cost of £32,000, and despatched with German officers and crew to the Persian Gulf. When the steamers were ready to do the work they had been intended for, the farmer, or farmers, of the Gulf customs raised difficulties and objected to pay the cost of maintaining the "Persepolis"; the governor of Muhamrah would not allow any interference with what he considered his hereditary rights of the shipping monopoly on the Karun, and the objects for which the steamers had been brought were not attained. The "Persepolis" remained idle at Bushire, and the "Susa" was tied up in the Failieh creek, near Muhamrah. The scheme of opening the Karun and of constructing a carriageable road from Ahvaz to Teherān was also abandoned.

The Control of the Persian Gulf.

Frequent interruptions occurred on the telegraph line between Teherān and Meshed in 1885, at the time of the "Panjdeh incident," when the Russians were advancing towards Afghanistan and Sir Peter Lumsden was on the Afghan frontier; and Sir Ronald Thomson concluded an agreement with the Persian government for the line to be kept in working order by an English inspector, the Indian government paying a share not exceeding 20,000 rupees per annum of the cost of maintenance, and an English signaller being stationed at Meshed. Shortly afterwards Sir Ronald Thomson left Persia (he died on the 15th of November 1888), and Arthur (afterwards Sir Arthur) Nicolson was appointed chargé d'affaires. During the latter's tenure of office an agreement was concluded between the Persian and British governments regarding the British telegraph settlement at Jask, and the telegraph conventions of 1868 and 1872 relative to telegraphic communication between Europe and India through Persia, in force until the 1st of January 1895, were prolonged until the 31st of January 1905 by two conventions dated the 3rd of July 1887. Since then these conventions have been prolonged to 1925.

Ayub Khan, son of Shir 'Ali (Shere Ali) of Afghanistan, who had taken refuge in Persia in October 1881, and was kept interned in Teherān under an agreement, concluded on the 17th of April 1884, between Great Britain and Persia, with a pension of £8000 per annum from the British government, escaped on the 14th of August 1887. After a futile attempt to enter Afghan territory and raise a revolt

against the Amir Abdur Rahman, he gave himself up to the British consul-general at Meshed in the beginning of November, and was sent under escort to the Turkish frontier and thence via Bagdad to India. Yahya Khan, Mushir-ad-daulah, the Persian minister for foreign affairs (died 1892), who was supposed to have connived at Ayub Khan's escape in order to please his Russian friends, was dismissed from office.

In December 1887 Sir Henry Drummond Wolff was appointed minister to Persia. The appointment greatly pleased the Persian court, and the shah lent a willing ear to his advocacy for the development of trade and commerce, construction of roads, abolition of various restrictions hampering Persian merchants, &c. The shah soon afterwards (May 26, 1888) issued a proclamation assuring freedom of life and property to all his subjects, and (Oct. 30) declared the Karun river open to international navigation up to Ahvaz. At about the same time he appointed Amin-es-Sultan, who had been prime-minister since 1884, Grand Vizier (Sadr 'azim). In the same year (June 25) the first railway in Persia, a small line of 5½ miles from Teherān to Shah-abdul-Azim, was opened under the auspices of a Belgian company. A few months later (Jan. 30, 1889) Baron Julius de Reuter—in consideration of giving up the rights which he held by his concession obtained in 1873—became the owner of a concession for the formation of a Persian State Bank, with exclusive rights of issuing bank-notes and working the mines of iron, copper, lead, mercury, coal, petroleum, manganese, borax, and asbestos in Persia. Russia now insisted upon what she considered a corresponding advantage; and Prince Dolgoruki, the Russian minister, obtained in February 1889 a document from the shah which gave to Russia the refusal of any railway concession in Persia for a period of five years. The Persian State Bank was established by British royal charter, dated the 2nd of September 1889, and started business in Persia (Oct. 23) as the "Imperial Bank of Persia." The railway agreement with Russia was changed in November 1890 into one interdicting all railways whatsoever in Persia.

Shah's Visit to Europe, 1889.

In April 1889 the shah set out upon his third voyage to Europe. After a visit to the principal courts, including a stay of a month in England, where he was accompanied by Sir Henry Drummond Wolff, he returned to his capital (Oct. 20). Sir Henry returned to Persia soon afterwards, and in March of the following year the Persian government granted another important concession, that of a tobacco monopoly, to British capitalists. In the autumn bad health obliged the British minister to leave Persia. It was during his stay in England that the shah, for two or three days without his grand vizier, who was mourning for the death of his brother, listened to bad advice and granted a concession for the monopoly of lotteries in Persia to a Persian subject. The latter ceded the concession to a British syndicate for £40,000. Very soon afterwards the shah was made aware of the evil results of this monopoly, and withdrew the concession, but the syndicate did not get the money paid for it returned. This unfortunate affair had the effect of greatly discrediting Persia on the London Stock Exchange for a long time. The concession for the tobacco monopoly was taken up by the Imperial Tobacco Corporation (1891). The corporation encountered opposition fostered by the clergy, and after a serious riot at Teherān (Jan. 4, 1892) the Persian government withdrew the concession and agreed to pay an indemnity of £500,000 (April 5, 1892). In order to pay this amount Persia contracted the 6 % loan of £500,000 through the Imperial Bank of Persia, which was redeemed in 1900 out of the proceeds of the Russian 5 % loan of that year. (For details of the tobacco concession and an account of the events which led to its withdrawal, see E. Lorini, *La Persia economica*, Rome, 1900, pp. 164–169; and Dr Feuvrier, *Trois ans à la cour de Perse*, Paris, 1899, ch. v., the latter ascribing the failure of the tobacco monopoly to Russian intrigue.)

In November 1889 Malcolm Khan, Nizam-ul-Mulk, who had been Persian representative to the court of Great Britain since October 1872, was recalled, and Mirza Mahommed 'Ali Khan, consul-general at Tiflis, was appointed in his stead, arriving in London the following March. In 1890 the scheme of a carriageable road from Teherān to Ahvaz was taken up again; the Imperial Bank of Persia obtained a concession, and work of construction was begun in the same year, and continued until 1893. In this year, too, the mining rights of the Imperial Bank of Persia were ceded to the Persian Bank Mining Rights Corporation, and a number of engineers were sent out to Persia. The total absence of easy means of communication, the high rates of transport, and the scarcity of fuel and water in the mineral districts made profitable operations impossible, and the corporation liquidated in 1894, after having expended a large sum of money.

Kate Greenfield Case.

Great excitement was caused in the summer of 1891 by the report that an English girl, Kate Greenfield, had been forcibly carried away from her mother's house at Tabriz by a Kurd. The British authorities demanded the girl's restitution from the Persian government. The Kurd, a Turkish subject, refused to give up the girl, and took her to Saujbulagh. The Turkish authorities protected him, and serious complications were imminent; but finally an interview between the girl and the British agent was arranged, and the matter was promptly settled by her declaring that she had left her mother's house of her own accord, and was the wife of the Kurd. It also became known that she was the daughter of a British-protected Hungarian named Grünfeld, who had died some years since, and an American lady of Tabriz.

Sir Frank Lascelles, who had been appointed minister to Persia in July, arrived at Teherān in the late autumn of 1891. In the following year Persia had a visitation of cholera. In Teherān and surrounding villages the number of fatal cases exceeded 28,000, or about 8 % of the population. In 1893 the epidemic appeared again, but in a milder form. In June 1893 Persia ceded to Russia the small but very fertile and strategically important district of Firuza and the adjacent lands between Baba Durmaz and Lutfabad on the northern frontier of Khorasan, and received in exchange the important village of Hissar and a strip of desert ground near Abbasabad on the frontier of Azerbaijan, which had become Russian territory in 1828, according to the Treaty of Turkmanchai.

French Archaeological Concession.

Sir Frank Lascelles left Persia in the early part of 1894, and was succeeded by Sir Mortimer Durand, who was appointed in July and arrived in Teherān in November. In the following year the shah, by a firman dated the 12th of May gave the exclusive right of exploring ancient sites in Persia to the French government, with the stipulation that one-half of the discovered antiquities, excepting those of gold and silver and precious stones, should belong to the French government, which also had the preferential right of acquiring by purchase the other half and any of the other antiquities which the Persian government might wish to dispose of. In 1897 M. J. de Morgan, who had been on a scientific mission in Persia some years before and later in Egypt, was appointed chief of a mission to Persia, and began work at Susa in December.

Assassination of the Shah, 1896.

On the 1st of May 1896 Nasru 'd-Din Shah was assassinated while paying his devotions at the holy shrine of Shah-abdul-Azim. Five days later he would have entered the fiftieth (lunar) year of his reign, and great preparations for duly celebrating the jubilee had been made throughout the country. The assassin was a small tradesman of Kermān named Mirza Reza, who had resided a short time in Constantinople and there acquired revolutionary and anarchist ideas from Kemalu 'd-Din, the so-called Afghan sheikh, who, after being very kindly treated by the shah, preached revolution and anarchy at Teherān, fled to Europe, visited London, and finally took up his residence in Constantinople. Kemalu 'd-Din was a native of Hamadan and a Persian subject, and as the assassin repeatedly stated that he was the sheikh's emissary and had acted by his orders, the Persian government demanded the extradition of Kemal from the Porte; but during the protracted negotiations which followed he died. Mirza Reza was hanged on the 12th of August 1896. There were few troubles in the country when the news of the shah's death became known. Serious rioting arose only in Shiraz and Fars, where some persons lost their lives and a number of caravans were looted. European firms who had lost goods during these troubles were afterwards indemnified by the Persian government. The new shah, Muzaffar-ud-Din (born March 25, 1853), then governor-general of Azerbaijan, residing at Tabriz, was enthroned there on the day of his father's death, and proceeded a few days later, accompanied by the British and Russian consuls, to Teherān, where he arrived on the 8th of June.

Currency Difficulties.

An excessive copper coinage during the past three or four years had caused much distress among the poorer classes since the beginning of the year, and the small trade was almost paralysed. Immediately after his accession the shah decreed that the coining of copper money should cease and the excess of the copper coinage be withdrawn from circulation. In order to reduce the price of meat, the meat tax, which had existed since ancient times was abolished. The Imperial Bank of Persia, which had already advanced a large sum of money, and thereby greatly facilitated the shah's early departure from Tabriz and enabled the grand vizier at Teherān to carry on the government, started buying up the copper coinage at all its branches and agencies. The nominal value of the copper money was 20 shahis equal to 1 kran, but in some places the copper money circulated at the rate of 80 shahis to the kran, less than its intrinsic value; at other places the rates varied between 70 and 25 shahis, and the average circulating value in all Persia was over 40. If government had been able to buy up the excess at 40 and reissue it gradually after a time at its nominal value when the people required it, the loss would have been small. But although the transport of copper money from place to place had been strictly prohibited, dishonest officials found means to traffic in copper money on their own account, and by buying it where it was cheap and forwarding it to cities where it was dear, the bank bought it at high rates, thus rendering the arrangement for a speedy withdrawal of the excess at small cost to government futile. It was only in 1899 that the distress caused by the excessive copper coinage ceased, and then only at very great loss to government. The well-intentioned abolition of the tax on meat also had not the desired result, for by a system of "cornering" the price of meat rose to more than it was before.

In the autumn of 1896 the grand vizier (Amin-es-Sultan) encountered much hostility from some members of the shah's entourage and various high personages. Amin-ad-daulah was appointed chief administrator (vizier) of Azerbaijan and sent to Tabriz. Shortly afterwards the grand vizier found it impossible to carry on his work, resigned, and retired to Kum (Nov. 24), and the shah formed a cabinet composed for the greater part of the leading members of the opposition to the grand vizier. After three months of the new régime affairs of state fell into arrears, and the most important department, that of the interior, was completely disorganized. The shah accordingly recalled Amin-ad-daulah from Tabriz (Feb. 1897), and appointed him minister president (raïs-i-vuzara) and minister of the interior. In June Amin-ad-daulah was made prime minister (vizir 'azim) and given more extended powers, and in August raised to the dignity of grand vizier (sadr 'azim). Nasru 'l-Mulk was appointed minister of finance (Feb. 1898), and made an attempt to introduce a simple system of accounts, establish a budget, reorganize the revenue department, make a new assessment of the land-tax, &c.; but resistance on the part of the officials rendered it abortive.

Ministerial Changes, 1896-1898.

In the latter part of 1897 E. Graves, the inspector of the English telegraph line from Jask eastwards, was brutally murdered by Baluchis, and the agents of the Persian government sent to seize the murderers were resisted by the tribes. A considerable district breaking out into open revolt, troops under the command of the governor-general of Kermān were despatched into Baluchistan. The port of Fannoch was taken in March 1898, and order was restored. One of the murderers was hanged at Jask (May 31).

Various attempts to obtain a foreign loan had been made during the previous year, but with the sole result of discrediting the Persian government in Europe. In the beginning of 1898 the shah's medical advisers strongly recommended a cure of mineral waters in Germany or France, and as his departure from Persia without paying the arrears to the army and to thousands of functionaries, or providing a sufficient sum for carrying on the government during his absence, would have created grave discontent, serious negotiations for a loan were entered upon. It was estimated that £1,000,000 would be required to pay all debts, including the balance of the 1892 loan, and leave a surplus sufficient for carrying on the government until the shah's return. London capitalists offered to float a loan for £1,250,000 at 5 % and on the guarantee of the customs of Fars and the Persian Gulf ports, and to give £1,025,000, or 82 % to the Persian government. They stipulated for a kind of control over the custom-houses by placing their own agents as cashiers in them. This stipulation was agreed to in principle by the grand vizier, Amin ad-daulah, who in March, in order to meet some pressing demands on the treasury borrowed £50,000 on the customs receipts of Kermānshāh and Bushire, and agreed to the lenders, the Imperial Bank of Persia's agents, being placed as cashiers in the custom-houses of both cities. He encountered, however, much opposition from the other ministers. Further negotiations ensued, and the shah's visit to Europe was abandoned. The assistance of the British government not being forthcoming, the grand vizier's position became more and more difficult, and on the 5th of June he had to resign. Muhsin Khan, Mushir-ad-daulah, minister for foreign affairs, then became president of the cabinet, and continued the negotiations, but could not bring them to a successful issue. Moreover, the Persian government, finding that the previous estimate of the money required for paying its debts was about 50 % below the mark, now asked for double the amount offered by the London capitalists, without, however, proportionately increasing the guarantee. This disorganized all previous arrangements, and the negotiations for a London loan came to an end for a time at the end of July, leaving in the minds of the Persians the unfortunate impression that the British government had done nothing to aid them.

Abortive Negotiations for British Loan in 1898.

On the 9th of July the former grand vizier, Amin-es-Sultan, was recalled from Kum, where he had resided since November 1896, arrived at Teherān three days later, and was reinstated as grand vizier on the 10th of August. His immense popularity, his friendly relations with the clergy, and some temporary advances from the banks, tided over difficulties for some time. The reform of the customs department was now (Sept. 1898) taken up seriously, and the three Belgian custom-house officials who had been engaged by Amin-ad-daulah in the beginning of the year were instructed to collect information and devise a scheme for the reorganization of the department and the abolition of the farm system. In March 1899 the custom-houses of the provinces of Azerbaijan and Kermānshāh were given over to the Belgians. The results of this step were so satisfactory that government was induced to abolish the farm system and set up the new régime in the other provinces in March 1900, and a number of other Belgian custom-houses officials were engaged.

In September, when renewed negotiations for a loan from London were not appearing to progress favourably, and the long-thought-of visit to Europe was considered to be absolutely necessary in the following year, the shah issued a firman authorizing the Russian Banque des Prêts de Perse to float a loan. Shortly after this it was said that the London capitalists were willing to lend £1,250,000 without insisting upon the objectionable control clause; but the proposal came too late, and on the 30th of January 1900, the Russian government had permitted the issue of a loan for 22½ million roubles (£2,400,000) at 5 %, guaranteed by all the customs receipts of Persia, excepting those for Fars and the Persian Gulf ports. Only in the event of any default of paying instalments and interests was the bank to be given control of the custom-houses. Persia received 85 % of the nominal capital, and the Russian government guaranteed the bondholders. Money was immediately remitted to Teherān, and nearly all the arrears were paid, while the balance of the 1892 London 6 % loan was paid off by direct remittance to London.

Russian Loan of 1900.

Sir Mortimer Durand left Teherān in the early spring, and proceeded to Europe on leave. On the 12th of April the shah, accompanied by the grand vizier and a numerous suite, started on his voyage to Europe. The affairs of State during his absence were entrusted to a council of ministers, under the presidency of his second son, Malik Mansur Mirza, Shua-es-Sultaneh, who had made a long stay on the Continent the year before.

Shah's Visits to Europe, 1900, 1902.

After a residence of a month at Contrexéville, the shah proceeded (July 14) to St Petersburg, and thence to Paris (July 29), intending to go to London on the 8th of August. But on account of the mourning in which several courts were thrown through the death of the king of Italy (July 29) and the duke of Saxe-Coburg-Gotha (July 30), the visits to England, Germany and Italy were abandoned. On the 2nd of August an anarchist made an attempt upon the shah's life in Paris.

F.—*Russo-British Rivalry (1902–1907) and the Persian Revolution (1906–1909).*

In 1902 Muzaffar-ud-Dīn Shah revisited the principal European capitals, and was received by King Edward VII. at Portsmouth in August. A mission headed by Viscount Downe was afterwards despatched to Persia, to invest the shah with the order of the Garter, a ceremony which took place in Teherān on the 2nd of February 1903. A week later, a new commercial treaty was concluded between Great Britain and Persia, which instituted various reforms in the customs service, secured to both countries the "most-favoured-nation" treatment, and substituted specific import and export duties for the charge of 5 % *ad valorem* provided for in the treaty of 1857. These provisions to some extent counterbalanced the losses inflicted on British trade by the Russo-Persian commercial treaty signed in 1902, which had seriously damaged the Indian tea trade, and had led to a rapid extension of Russian influence. Between 1899 and 1903 the Russian Bank had lent Persia £4,000,000, of which fully half was paid to the shah for his personal requirements. Russian concessionnaires were given the right to build roads from Tabriz to Teherān (1902) and from Tabriz to Kazvin (1903); and the Russian Bank opened new branches in Seistan—an example followed in 1903 by the Bank of Persia. It was, however, in the Persian Gulf that the rivalry between Great Britain and Russia threatened to become dangerous. Great Britain had almost a monopoly of maritime commerce in the Gulf, and was alone responsible for buoying, lighting and policing its waters. The British claim to political supremacy in this region had thus a solid economic basis; it had been emphasized by the British action at Kuwet (*q.v.*) in 1899, and by the declaration made in the House of Lords by Lord Lansdowne, as secretary of state for foreign affairs, to the effect that Great Britain would resist by all means in its power the attempt of any other nation to establish itself in force on the shores of the Gulf. On the 16th of November 1903, Lord Curzon, the viceroy of India, sailed from Karachi for the Persian Gulf. His ship, the "Hardinge," was escorted by four cruisers, and the voyage was regarded as a political demonstration, to be interpreted in connexion with Lord Lansdowne's declaration. At Bushire, on the 1st of December, the Persian governor of Fars, Ala ad-daula, committed a breach of diplomatic etiquette which induced Lord Curzon to sail away without landing. This incident was considered by some British observers to have been brought about by Russian intrigue, and the fact that Ala ad-daula was dismissed in 1904, after the Japanese had achieved several initial successes in the Russo-Japanese war, was held to confirm this opinion. But Russian financial and commercial influence in

Persia continued to increase; in December 1904 a special mission under Mirza Riza Khan was received in audience by the tsar; and in May 1905 Muzaffar-ud-Dīn Shah himself left Persia to visit the courts of Vienna and St Petersburg.

The Seistan Mission of 1902–1905.—A dispute as to the frontier between Afghanistan and Seistan arose in 1902. The boundary delimited by the Seistan mission of 1870–1872, and known as the "Goldsmid line," was drawn along the course of the river Helmund. Between 1872 and 1902 the Helmund took a more westerly direction; no boundary marks had been erected, and a wide strip of territory remained in dispute. The Persians claimed that the boundary was the old bed of the river, the Afghans that it was the new bed; and in accordance with the treaty of 1857 both parties asked the British government to arbitrate. In January 1903, Colonel Arthur Henry MacMahon, who had previously delimited the frontier between Afghanistan and British India, was despatched from Quetta. The Persian officials were at first hostile, but their opposition, which was attributed to Russian influence at Teherān, was eventually overcome, and Colonel MacMahon (who was knighted in 1906) delivered his final award, sustaining the Persian contention, in February 1905.

British Commercial Missions.—Owing to the success of the Maclean mission, which visited and reported upon the markets and trade-routes of north-western Persia in 1903, under the direction of the Board of Trade, a similar mission was sent to southern Persia in 1904, under the auspices of the Upper India Chamber of Commerce, the Bengal Chamber and the Indian Tea Cess Company. The report of this mission (by Gleadowe-Newcomen) was published in 1906. After showing that civilized government was practically non-existent in the regions visited, it suggested as the chief remedy the conclusion of a Russo-British convention, and the division of Persia into "spheres of influence."

Russo-British Convention of 1907.—The political situation created by the Russo-Japanese War and by an internal crisis in Persia itself rendered possible such an agreement between the two rival powers, and a Russo-British convention was signed on the 31st of August 1907. Its chief provisions, in regard to Persia, are as follow: (1) north of a line drawn from Kasr-i-Shirin, Isfaban, Yezd and Kakh to the junction of the Russian, Persian and Afghan frontiers Great Britain undertook to seek no political or commercial concession, and to refrain from opposing the acquisition of any such concession by Russia or Russian subjects; (2) Russia gave to Great Britain a like undertaking in respect of the territory south of a line extending from the Afghan frontier to Gazik, Birjend, Kermān and Bander Abbasi; (3) the territory between the lines above-mentioned was to be regarded as a neutral zone in which either country might obtain concessions; (4) all existing concessions in any part of Persia were to be respected; (5) should Persia fail to meet its liabilities in respect of loans contracted, before the signature of the convention, with the Persian Banque d'Escompte and de Prêts, or with the Imperial Bank of Persia, Great Britain and Russia reserved the right to assume control over the Persian revenues payable within their respective spheres of influence. With this convention was published a letter from the British secretary of state for foreign affairs (Sir E. Grey), stating (1) that the Persian Gulf lay outside the scope of the convention, (2) that Russia admitted the special interests of Great Britain in the Gulf, and (3) that these interests were to be maintained by Great Britain as before.

The Persian Constitution.—The misgovernment and disorder which were revealed to Europe by the Gleadowe-Newcomen report, and by such sporadic outbreaks as the massacre of the Babis in Yezd (1903), had caused widespread discontent in Persia. In 1905, partly owing to the example shown by the revolutionary parties in Russia, this discontent took the form of a demand for representative institutions. On the 5th of August 1906, Muzaffar-ud-Dīn Shah issued a rescript in which he undertook to form a national council (Majlis) representing the whole people (see above, *Constitution*). The Majlis was duly elected, and was opened by the shah in person on the 7th of October 1906. In January 1907 the shah died, and was succeeded by his eldest son, Mahommed 'Ali Mirza, who on the 11th of February published a message to his people, pledging himself to adhere to the new constitution.

The Revolution.—On the 12th of November the shah visited the Majlis, and repeated his pledge, but during December a riot in Teherān developed into a political crisis, in which the shah's troops were employed against the civil population. The Majlis issued a manifesto to the powers, declaring that the shah intended to overthrow the constitution, and demanding intervention. The Russian and British ministers in Teherān urged Mahommed 'Ali to maintain the constitution, and he sent a message to the Majlis, promising compliance with its demands and agreeing to place the whole army under the control of the ministry of war. These concessions allayed the prevailing unrest for a time, but the Royalist and Nationalist parties continued secretly to intrigue against one another, and in February 1908, while the shah was driving in Teherān, two bombs were exploded under his motor-car. Two persons were killed, but the shah was unhurt, and the Majlis formally congratulated him on his escape. A prolonged ministerial crisis, in April and May, was attributed by the Nationalists to the influence of reactionary courtiers, and by the Royalists to the influence of the Anjumans, or political clubs, which were alleged to control the Nationalist majority in the Majlis. Early in June the Majlis urged the shah to dismiss the courtiers under suspicion. Mahommed 'Ali consented, but withdrew from Teherān; and on his departure the royal bodyguard of so-called "Cossacks"—Persian soldiers officered by Russians in the shah's service—at once came into conflict with the Nationalists. The house of parliament was bombarded, and when the Majlis appointed commissioners to discuss terms, the shah issued a manifesto dissolving the Majlis, and entrusted the restoration of order in Teherān to military administrators. He also proposed to substitute for the elected Majlis a council of forty members, nominated by himself; but under pressure from Great Britain and Russia he promised to abandon this scheme and to order another general election. Meanwhile, civil war had broken out in the provinces; Kurdish raiders had sacked many villages near Tabriz; Persian brigands had attacked the Russian frontier-guards on the borders of Transcaucasia, and the indemnity demanded by the tsar's government was not paid until several Persian villages had been burned by Russian troops. This incident, combined with the employment of the so-called Cossacks, evoked a protest from the Nationalists, who asserted that Russia was aiding the Royalists; the accusation was true only in so far as it referred to the conduct of certain Russian officials who acted without the consent of the Russian government. Early in 1909, indeed, a Russian force of 2600 men was sent to watch events near Tabriz, and if necessary to intervene in favour of the Nationalists who held the town, and had for some months been besieged by the shah's troops. The presence of the Russians ultimately induced the Royalists to abandon the siege. In January of the same year the revolution spread to Isfahan, where the Bakhtiari chiefs made common cause with the Nationalists, deposed the Royalist governor and marched on the capital. In May and June the shah issued proclamations declaring his fidelity to the constitution, and promising an amnesty to all political offenders; but he was powerless to stay the advance of the combined Bakhtirai and Nationalist troops, who entered Teherān on the 13th of July. After severe street fighting the Cossacks deserted to the rebels, and the shah took refuge in the Russian legation (July 15). This was interpreted as an act of abdication; on the same day the national council met, and chose Mahommed 'Ali's son, Sultan Ahmad Mirza, aged thirteen, as his successor. Asad ul-Mulk, head of the Kajar tribe was appointed regent. On the 9th of September 1909, the ex-shah departed for his place of exile in the Crimea, escorted by Russian Cossacks and Indian sowars. On the 15th of November a newly elected Majlis was formally opened by the shah.

Bibliography.—1. *General*: Lord Curzon of Kedleston, *Persia and the Persian Question* (London, 1892), contains an account of European literature relating to Persia (A.D. 900–1901) and numerous bibliographical notes. Other official publications of historical importance are the annual British F. O. Reports and the U.S. Consular Reports.

Language and Literature

I. *Persian* (*Iranian*) *Languages*.—Under the name of Persian is included the whole of that great family of languages occupying a field nearly coincident with the modern Iran, of which true Persian is simply the western division. It is therefore common and more correct to speak of the Iranian family. The original native name of the race which spoke these tongues was Aryan. King Darius is called on an inscription "a Persian, son of a Persian, an Aryan of Aryan race"; and the followers of the Zoroastrian religion in their earliest records never give themselves any other title but *Airyavō danghavō*, that is to say, "Aryan races." The province of the Iranian language is bounded on the west by the Semitic, on the north and north-east by the Ural-altaic or Turanian, and on the south-east by the kindred language of India.

Iranian Languages.

The Iranian languages form one of the great branches of the Indo-European stem, first recognized as such by Sir William Jones and Friedrich Schlegel. The Indo-European or Indo-Germanic languages are divided by Brugmann into (1) Aryan, with sub-branches (*a*) Indian, (*b*) Iranian; (2) Armenian; (3) Greek; (4) Albanian; (5) Italic; (6) Celtic; (7) Germanic, with sub-branches (*a*) Gothic, (*b*) Scandinavian, (*c*) West Germanic; and (8) Balto-Slavonic. (See Indo-European.) The Aryan family (called by Professor Sievers the "Asiatic base-language") is subdivided into (1) Iranian (Eranian, or Erano-Aryan) languages, (2) Pisacha, or non-Sanskritic Indo-Aryan languages, (3) Indo-Aryan, or Sanskritic Indo-Aryan languages (for the last two see Indo-Aryan); Iranian being also grouped into Persian and non-Persian.

The common characteristics of all Iranian languages, which distinguish them especially from Sanskrit, are as follow:—

1. Changes of the original *s* into the spirant *h*. Thus—

Sanskrit.	*Zend.*	*Old Persian.*	*New Persian.*
sindhu (Indus)	hindu	hindu	hind
sarva (all)	haurva	haruva	har
sama (whole)	hama	hama	ham
santi (sunt)	henti	hantiy	hend.

2. Change of the original aspirates *gh, dh, bh* (= χ, θ, ϕ) into the corresponding medials—

Sanskrit.	*Zend.*	*Old Persian.*	*New Persian.*
bhūmi (earth)	būmi	bumi	būm
dhita (θετός)	dāta	dāta	dād
gharma (heat)	garema	garma	garm.

3. *k, t, p* before a consonant are changed into the spirants *kh, th, f*—

Sanskrit.	*Zend.*	*Old Persian.*	*New Persian.*
prathama (first)	fratema	fratama	fradum (Parsi)
kratu (insight)	khratu	. . . .	khirad.

4. The development of soft sibilants—

Sanskrit.	*Zend.*	*Old Persian.*	*New Persian.*
Asurō Medhās [1]	Ahurō Mazdāo	Auramazdā	Ormuzd
bāhu (arm)	bāzu	. . .	bāzū
hima (hiems)	zima	. . . .	zim.

Our knowledge of the Iranian languages in older periods is too fragmentary to allow of our giving a complete account of this family and of its special historical development. It will be sufficient here to distinguish the main types of the older and the more recent periods. From antiquity we have sufficient knowledge of two dialects, the first belonging to eastern Iran, the second to western.

Zend.

1. *Zend or Old Bactrian*.—Neither of these two titles is well chosen. The name Old Bactrian suggests that the language was limited to the small district of Bactria, or at least that it was spoken there—which is, at the most, only an hypothesis. Zend, again (originally *āzaintish*), is not the name of a language, as Anquetil Duperron supposed, but means "interpretation" or "explanation," and is specially applied to the medieval Pahlavi translation of the *Avesta*. Our "Zend-Avesta" does not mean the *Avesta* in the Zend language, but is an incorrect transcription of the original expression "Avistāk va zand," *i.e.* "the holy text (*Avesta*) together with the translation." But, since we still lack sure data to fix the home of this language with any certainty, the convenient name of Zend has become generally established in Europe, and may be provisionally retained. But the home of the Zend language was certainly in eastern Iran; all attempts to seek it farther west—*e.g.* in Media [2]—must be regarded as failures.

Zend is the language of the so-called *Avesta*,[3] the holy book of the Persians, containing the oldest documents of the religion of Zoroaster. Besides this important monument, which is about twice as large as the *Iliad* and *Odyssey* put together, we only possess very scanty relics of the Zend language in medieval glosses and scattered quotations in Pahlavi books. These remains, however, suffice to give a complete insight into the structure of the language. Not only amongst Iranian languages, but amongst all the languages of the Indo-European group, Zend takes one of the very highest places in importance for the comparative philologist. In age it almost rivals Sanskrit; in primitiveness it surpasses that language in many points; it is inferior only in respect of its less extensive literature, and because it has not been made the subject of systematic grammatical treatment. The age of Zend must be examined in connexion with the age of the *Avesta*. In its present form the *Avesta* is not the work of a single author or of any one age, but embraces collections produced during a long period. The view which became current through Anquetil Duperron, that the *Avesta* is throughout the work of Zoroaster (in Zend, *Zarathushtra*), the founder of the religion, has long been abandoned as untenable. But the opposite view, that not a single word in the book can lay claim to the authorship of Zoroaster, also appears on closer study too sweeping. In the *Avesta* two stages of the language are plainly distinguishable. The older is represented in but a small part of the whole work, the so-called *Gāthās* or songs. These songs form the true kernel of the book Yasna;[4] they must have been in existence long before all the other parts of the *Avesta*, throughout the whole of which allusions to them occur. These gāthās are what they claim to be, and what they are honoured in the whole *Avesta* as being—the actual productions of the prophet himself or of his time. They bear in themselves irrefutable proofs of their authenticity, bringing us face to face not with the Zoroaster of the legends but with a real person, announcing a new doctrine and way of salvation, no supernatural Being assured of victory, but a mere man, struggling with human conflicts of every sort, in the midst of a society of fellow-believers yet in its earliest infancy. It is almost impossible that a much later period could have produced such unpretentious and almost depreciatory representations of the deeds and personality of the prophet. If, then, the gāthās reach back to the time of Zoroaster, and he himself, according to the most probable estimate, lived as early as the 14th century B.C., the oldest component parts of the *Avesta* are hardly inferior in age to the oldest Vedic hymns. The gāthās are still extremely rough in style and expression; the language is richer in forms than the more recent Zend; and the vocabulary shows important differences. The predominance of the long vowels is a marked characteristic, the constant appearance of a long final vowel contrasting with the preference for a final short in the later speech.

[1] Name of the supreme god of the Persians.

[2] Cf. J. Darmesteter, *Études iraniennes*, i. 10 (Paris, 1883).

[3] This, and not *Zend-Avesta*, is the correct title for the original text of the Persian Bible. The origin of the word is doubtful, and we cannot point to it before the time of the Sassanians. Perhaps it means "announcement," "revelation."

[4] The *Avesta* is divided into three parts: (1) Yasna, with an appendix, Visparad, a collection of prayers and forms for divine service; (2) Vendidad, containing directions for purification and the penal code of the ancient Persians; (3) Khordah-Avesta, or the Small Avesta, containing the Yasht, the contents of which are for the most part mythological, with shorter prayers for private devotion.

Sanskrit.	*Gāthā.*	*Later Zend.*
abhi (near)	aibī	aiwi
īhā (work)	īzhā	īzha.

The clearest evidence of the extreme age of the language of the gāthās is its striking resemblance to the oldest Sanskrit, the language of the Vedic poems. The gāthā language (much more than the later Zend) and the language of the *Vedas* have a close resemblance, exceeding that of any two Romanic languages; they seem hardly more than two dialects of one tongue. Whole strophes of the gāthās can be turned into good old Sanskrit by the application of certain phonetic laws; for example—

" mat vāo padāish yā frasrūtā īzhayāo
pairijasāi mazdā nstānazastō
aṭ vāo ashā aredrahyācā nemanghā
āt vāo vangēhush mananghō hunaretātā,"

becomes in Sanskrit—

" mana vah padāih yā pracrutā ihāyāh
parigachāi medha uttānahastah
āt va rtena radhrasyaca namasā
āt vō vasor manasah sūnṛtayā." [1]

The language of the other parts of the *Avesta* is more modern, but not all of one date, so that we can follow the gradual decline of Zend in the *Avesta* itself. The later the date of a text, the simpler is the grammar, the more lax the use of the cases. We have no chronological points by which to fix the date when Zend ceased to be a living language; no part of the *Avesta* can well be put later than the 5th or 4th century B.C. Before Alexander's time it is said to have been already written out on dressed cowhides and preserved in the state archives at Persepolis.

The followers of Zoroaster soon ceased to understand Zend. For this reason all that time had spared of the *Avesta* was translated into Middle Persian or PAHLAVĪ (*q.v.*) under the Sassanians. This translation, though still regarded as canonical by the Parsees, shows a very imperfect knowledge of the original language. Its value for modern philology has been the subject of much needless controversy amongst European scholars. It is only a secondary means towards the comprehension of the ancient text, and must be used with discrimination. A logical system of comparative exegesis, aided by constant reference to Sanskrit, its nearest ally, and to the other Iranian dialects, is the best means of recovering the lost sense of the Zend texts.

The phonetic system of Zend consists of simple signs which express the different shades of sound in the language with great precision. In the vowel-system a notable feature is the presence of the short vowels *e* and *o*, which are not found in Sanskrit and Old Persian; thus the Sanskrit *santi*, Old Persian *hantiy*, becomes *henti* in Zend. The use of the vowels is complicated by a tendency to combinations of vowels and to epenthesis, *i.e.* the transposition of weak vowels into the next syllable; *e.g.* Sanskrit *bharati*, Zend *baraiti* (he carries); Old Persian *margu*, Zend *mōurva* (Merv); Sanskrit *rinakti*, Zend *irinakhti*. Triphthongs are not uncommon, *e.g.* Sanskrit *açvebhyas* (dative plural of *açva*, a horse) is in Zend *aspaēibyō*; Sanskrit *kṛnoti* (he does), Zend *kerenaoiti*. Zend has also a great tendency to insert irrational vowels, especially near liquids; owing to this the words seem rather inflated; *e.g.* *savya* (on the left) becomes in Zend *hāvaya*; *bhrājati* (it glitters), Zend *barāzaiti*; *gnā* (γυνή), Zend *genā*. In the consonantal system we are struck by the abundance of sibilants (*s* and *sh*, in three forms of modification, *z* and *zh*) and nasals (five in number), and by the complete absence of *l*. A characteristic phonetic change is that of *rt* into *sh*; *e.g.* Zend *asha* for Sanskrit *ṛta*, Old Persian *arta* (in *Artaxerxes*); *fravashi* for Pahlavī *fravardin*, New Persian *ferver* (the spirits of the dead). The verb displays a like abundance of primary forms with Sanskrit, but the conjugation by periphrasis is only slightly developed. The noun has the same eight cases as in Sanskrit. In the gāthās there is a special ablative, limited, as in Sanskrit, to the " a " stems, whilst in later Zend the ablative is extended to all the stems indifferently.

We do not know in what character Zend was written before the time of Alexander. From the Sassanian period we find an alphabetic and very legible character in use, derived from Sassanian Pahlavī, and closely resembling the younger Pahlavī found in books. The oldest known manuscripts are of the 14th century A.D.[2]

Although the existence of the Zend language was known to the Oxford scholar Thomas Hyde, the Frenchman Anquetil Duperron, who went to the East Indies in 1755 to visit the Parsee priests, was the first to draw the attention of the learned world to the subject. Scientific study of Zend texts began with E. Burnouf, and has since then made rapid strides, especially since the *Vedas* have opened to us a knowledge of the oldest Sanskrit.

Old Persian.

2. *Old Persian.*—This is the language of the ancient Persians properly so-called,[3] in all probability the mother-tongue of Middle Persian of the Pahlavī texts, and of New Persian. We know Old Persian from the rock-inscriptions of the Achaemenians, now fully deciphered. Most of them, and these the longest, date from the time of Darius, but we have specimens as late as Artaxerxes Ochus. In the latest inscriptions the language is already much degraded; but on the whole it is almost as antique as Zend, with which it has many points in common. For instance, if we take a sentence from an inscription of Darius as—

" Auramazdā hya imām bumim adā hya avam asmānam adā hya martiyam adā hya siyātim adā martiyahyā hya Dārayavaum khshāyathiyam akunaush aivam paruvnām khshāyathiyam,"

it would be in Zend—

" Ahurō mazdāo yō imām būmīm adāṭ yō aom asmanem adāṭ yō mashīm adāṭ yō shāitīm adāṭ mashyahē yō dārayaṭvohūm khshaētem akerenaoṭ ōyūm pourunām khshaētem." [4]

The phonetic system in Old Persian is much simpler than in Zend; we reckon twenty-four letters in all. The short vowels *e*, *o* are wanting; in their place the old " a " sound still appears as in Sanskrit, *e.g.* Zend *bagem*, Old Persian *bagam*, Sanskrit *bhagam*; Old Persian *hamarana*, Zend *hamerena*, Sanskrit *samarana*. As regards consonants, it is noticeable that the older *z* (soft *s*) still preserved in Zend passes into *d*—a rule that still holds in New Persian; compare—

Sanskrit.	*Zend.*	*Old Persian.*	*New Persian.*
hasta (hand)	zasta	dasta	dast
jrayas (sea)	zrayō	daraya	daryā
aham (I)	azem	adam	. . .

Also Old Persian has no special *l*. Final consonants are almost entirely wanting. In this respect Old Persian goes much farther than the kindred idioms, *e.g.* Old Persian *abara*, Sanskrit *abharat*, Zend *abarat*, ἔφερε: nominative *baga*, root-form *baga-s*, Sanskrit *bhagas*. The differences in declension between Old Persian and Zend are unimportant.

Old Persian inscriptions are written in the cuneiform character of the simplest form, known as the " first class." Most of the inscriptions have besides two translations into the more complicated kinds of cuneiform character of two other languages of the Persian Empire. One of these is the Assyrian; the real nature of the second is still a mystery. The interpretation of the Persian cuneiform, the character and dialect of which were equally unknown, was begun by G. F. Grotefend, who was followed by E. Burnouf, Sir Henry Rawlinson and J. Oppert. The ancient Persian inscriptions have been collected in a Latin translation with grammar and glossaries by F. Spiegel (Leipzig, 1862; new and enlarged ed., 1881). The other ancient tongues and dialects of this family are known only by name; we read of peculiar idioms in Sogdiana, Zabulistan, Herat, &c. It is doubtful whether the languages of the Scythians, the Lycians and the Lydians, of which hardly anything remains, were Iranian or not.

After the fall of the Achaemenians there is a period of five centuries, from which no document of the Persian language has come down to us.

Under the Arsacids Persian nationality rapidly declined; all that remains to us from that period—namely, the inscriptions on coins—is in the Greek tongue. Only towards the end of the Parthian dynasty and after the rise of the Sassanians, under whom the national traditions were again cultivated in Persia, do we recover the lost traces of the Persian language in the Pahlavī inscriptions and literature.

Middle Persian.

3. *Middle Persian.*—The singular phenomena presented by Pahlavī writing have been discussed in a separate article (see PAHLAVĪ). The languages which it disguises rather than expresses—Middle Persian, as we may call it—presents many changes as compared with the Old Persian of the Achaemenians. The abundant grammatical forms of the ancient language are much reduced in number; the case-ending is lost; the noun has only two inflexions, the singular and the plural; the cases are expressed by prepositions—*e.g.* *rūbān* (the soul), nom. and acc. sing., plur. *rūbānān*; dat. *val* or *avo rūbān*, abl. *min* or *az rūbān*. Even distinctive forms for gender are entirely abandoned, *e.g.* the pronoun *avo* signifies " he," " she," " it." In the verb compound forms predominate. In this respect Middle Persian is almost exactly similar to New Persian.

[1] " With verses of my making, which are now heard, and with prayerful hands, I come before thee, Mazda, and with the sincere humility of the upright man and with the believer's song of praise."

[2] *Grammars* by F. Spiegel (Leipzig, 1867) and A. V. W. Jackson (Stuttgart, 1892); *Dictionary* by F. Justi (Leipzig, 1864); editions of the *Avesta* by N. L. Westergaard (Copenhagen, 1852) and C. F. Geldner (Stuttgart, 1886–1895; also in English); translation into German by Spiegel (Leipzig, 1852), and into English by Darmesteter (Oxford, 1880) in Max Müller's *Sacred Books of the East*.

[3] And perhaps of the Medes. Although we have no record of the Median language we cannot regard it as differing to any great extent from the Persian. The Medes and Persians were two closely-connected races. There is nothing to justify us in looking for the true Median language either in the cuneiform writings of the second class or in Zend.

[4] " Ormuzd, who created this earth and that heaven, who created man and man's dwelling-place, who made Darius king, the one and only king of many."

New Persian.

4. *New Persian.*—The last step in the development of the language is New Persian, represented in its oldest form by Firdousī. In grammatical forms it is still poorer than Middle Persian; except English, no Indo-European language has so few inflexions, but this is made up for by the subtle development of the syntax. The structure of New Persian has hardly altered at all since the *Shāhnāma*; but the original purism of Firdousī, who made every effort to keep the language free from Semitic admixture, could not long be maintained. Arabic literatnre and speech exercised so powerful an influence on New Persian, especially on the written language, that it could not withstand the admission of an immense number of Semitic words. There is no Arabic word which would be refused acceptance in good Persian. But, nevertheless, New Persian has remained a language of genuine Iranian stock.

Among the changes of the sound system in New Persian, as contrasted with earlier periods, especially with Old Persian, the first that claims mention is the change of the tenues *k, t, p, c,* into *g, d, b, z*. Thus we have—

Old Persian or Zend.	*Pahlavi.*	*New Persian.*
mahrka (death)	mark	marg
Thraētaona	Frītūn	Farīdūn
āp (water)	āp	āb
hvatō (self)	khōt	khōd
raucah (day)	rōj	rūz
haca	aj	az.

A series of consonants often disappear in the spirant; thus—

Old Persian or Zend.	*Pahlavī.*	*New Persian.*
kaufa (mountain)	kof	kōh
gāthu (place), Z. gātu	gās	gāh
cathware (four)	....	cihār
hañdaka (slave)	bandak	bandah
spāda (army)	....	sipāh
dadāmi (I give)	....	diham.

Old *d* and *dh* frequently become *y*—

Old Persian or Zend.	*Pahlavī.*	*New Persian.*
madhu (wine)	....	mai
baodhō (consciousness)	bōd	bōi
pādha (foot)	....	pāi
kadha (when)	....	kai.

Old *y* often appears as *j*: Zend *yāma* (glass), New Persian *jām*; *yavan* (a youth), New Persian *javān*. Two consonants are not allowed to stand together at the beginning of a word; hence vowels are frequently inserted or prefixed, *e.g.* New Persian *sitādan* or *istādan* (to stand), root *stā*; *birādar* (brother), Zend and Pahlavi *brātar*.[1]

Modern Dialects.

Amongst modern languages and dialects other than Persian which must be also assigned to the Iranian family may be mentioned:—

1. *Kurdish*, a language nearly akin to New Persian, with which it has important characteristics in common. It is chiefly distinguished from it by a marked tendency to shorten words at all costs, *e.g.* Kurd. *berā* (brother) = New Persian *birādar*; Kurd. *dim* (I give) = New Persian *diham*; Kurd. *spī* (white) = New Persian *sipēd*.

2. *Baluch*, the language of Baluchistan, also very closely akin to New Persian, but especially distinguished from it in that all the old spirants are changed into explosives, *e.g.* Baluch *vāb* (sleep) = Zend *hvafna*; Baluch *kap* (slime) = Zend *kafa*, New Persian *haf*; Baluch *hapt* (seven) = New Persian *haft*.

3. *Ossetic*, true Iranian, in spite of its resemblance in sound to the Georgian.[2]

4. *Pushtu* (less accurately Afghan), which has certainly been increasingly influenced by the neighbouring Indian languages in inflexion, syntax and vocabulary, hut is still at bottom a pure Iranian language, not merely intermediate between Iranian and Indian.

The position of *Armenian* remains doubtful. Some scholars attribute it to the Iranian family; others prefer to regard it as a separate and independent member of the Indo-European group. Many words that at first sight seem to prove its Iranian origin are only adopted from the Persian.[3] (K. G.)

II. *Modern Persian Literature.*—Persian historians are greatly at variance about the origin of their national poetry. Most of them go back to the 5th Christian century and ascribe to one of the Sassanian kings, Bahrām V. (420–439), the invention of metre and rhyme; others mention as author of the first Persian poem a certain Abulhafs of Soghd, near Samarkand. In point of fact, there is no doubt that the later Sassanian rulers fostered the literary spirit of their nation (see Pahlavī). Pahlavī books, however, fall outside of the present subject, which is the literature of the idiom which shaped itself out of the older Persian speech by slight modifications and a steadily increasing mixture of Arabic words and phrases in the 9th and 10th centuries of our era, and which in all essential respects has remained the same for the last thousand years. The death of Hārūn al-Rashīd in the beginning of the 9th century, which marks the commencement of the decline of the caliphate, was at the same time the starting-point of movements for national independence and a national literature in the Iranian dominion, and the common cradle of the two was in the province of Khorāsān, between the Oxus and the Jaxartes. In Merv, a Khorāsānian town, a certain 'Abbās composed in 809 A.D. (193 A.H.), according to the oldest biographical writer of Persia, Mahommed 'Aufī, the first real poem in modern Persian, in honour of the Abbāsid prince Mamūn, Hārūn al-Rashīd's son, who had himself a strong predilection for Persia, his mother's native country, and was, moreover, thoroughly imbued with the freethinking spirit of his age. Soon after this, in 820 (205 A.H.), Tāhir, who aided Mamūn to wrest the caliphate from his brother Amīn, succeeded in establishing the first semi-independent Persian dynasty in Khorāsān, which was overthrown in 872 (259 A.H.) by the Ṣaffārids.

Earliest Modern Persian Poet.

The development of Persian poetry under these first native dynasties was slow. Arabic language and literature had gained too firm a footing to be supplanted at once by a new literary idiom still in its infancy; nevertheless the few poets who arose under the Ṭāhirids and Ṣaffārids show already the germs of the characteristic tendency of all later Persian literature, which aims at amalgamating the enforced spirit of Islamism with their own Aryan feelings, and reconciling the strict deism of the Mahommedan religion with their inborn loftier and more or less pantheistic ideas; and we can easily trace in the few fragmentary verses of men like Ḥanzala, Ḥakīm Fīrūz and Abū Salīk those principal forms of poetry now used in common by all Mahommedan nations—the forms of the *qaṣīda* (the encomiastic, elegiac or satirical poem), the *ghazal* or ode (a love-ditty, wine-song or religious hymn), the *rubā'ī* or quatrain (our epigram, for which the Persians invented a new metre in addition to those adopted from the Arabs), and the *mathnawī* or double-rhymed poem (the legitimate form for epic and didactic poetry). The first who wrote such a mathnawī was Abū Shukūr of Balkh, the oldest literary representative of the third dynasty of Khorāsān, the Sāmānids, who had been able in the course of time to dethrone the Ṣaffārids, and to secure the government of Persia, nominally still under the supremacy of the caliphs in Bagdad, but in fact with full sovereignty. The undisputed reign of this family dates from the accession of Amīr Naṣr II. (913–942; 301–331 A.H.), who, more than any of his predecessors, patronized arts and sciences in his dominions. The most accomplished minstrels of his time were Mahommed Farālādī (or Farālāwī); Abū 'l-'Abbās of Bokhārā, a writer of very tender verses; Abū 'l-Muẓaffar Naṣr of Nīshāpūr; Abū 'Abdallāh Mahommed of Junaid, equally renowned for his Arabic and Persian poetry; Ma'nawī of Bokhārā, full of original thoughts and spiritual subtleties; Khusrawānī, from whom even Firdousī condescended to borrow quotations; Abū 'l-Hasan Shahīd of Balkh, the first who made a dīwān or alphabetical collection of his lyrics; and Rūdagī (or Rūdakī), the first classic genius of Persia, who impressed upon every form of lyric and didactic poetry its peculiar stamp and individual character (see Rūdagī). His graceful and captivating style was imitated by Ḥakīm Khabbaz of Nīshāpūr, a great baker, poet and quack; Abū Shu'aib Ṣāliḥ of Herāt, who left a spirited little song in honour of a young Christian maiden; Raunaqī of Bokhārā; Abū'l-Fatḥ of Bust, who was also a good Arabic poet; the amīr Abū 'l-Ḥasan 'Alī Alagātchī, who handled the pen as skilfully as the sword; 'Umāra of Merv, a famous

astronomer; and Kisā'ī, a native of the same town, a man of stern and ascetic manners, who sang in melodious rhythm the praise of 'Alī and the twelve imāms. All these poets flourished under the patronage of the Sāmānid princes, who also fostered the growing desire of their nation for historical and antiquarian researches, for exegetical and medical studies. Manṣūr I., the grandson of Rūdagī's patron, ordered (963; 352 A.H.) his vizier Bal'amī to translate the famous universal history of Ṭabarī (838–923 A.D.) from Arabic into Persian; and this

Tabari.

Ta'rīkh-i-Ṭabarī, the oldest prose work in modern Persian, is not merely remarkable from a philological point of view, it is also the classic model of an easy and simple style (French trans. by L. Dubeux and H. Zotenberg, 1867–1874). The same prince employed the most learned among the ulemā of Transoxiana for a translation of Ṭabarī's second great work, the *Tafsīr*, or commentary on the Koran, and accepted the dedication of the first Persian book on medicine, a pharmacopoeia by the physician Abū Manṣūr Muwaffaq b. 'Alī of Herāt (edited by Seligmann, Vienna, 1859), which forms a kind of connecting link between Greek and Indian medicine. It was soon after further developed by the great Avicenna (d. 1037; 428 A.H.), himself a Persian by birth and author of pretty wine-songs, moral maxims, psychological tracts, and a manual of philosophic science, the *Dānishnāma-i-Alā'ī*, in his native tongue.

A still greater impulse was given, both to the patriotic feelings and the national poetry of the Persians, by Manṣūr's son and successor, Prince Nūḥ II., who ascended the throne in 976 (365 A.H.). Full of enthusiasm for the glorious past of the old Iranian kingdom, he charged his court poet Daḳīḳī (Daqiqi), who openly professed in his ghazals the Zoroastrian

Daḳīḳī.

creed, to turn the *Khodā'ināma*, or "Book of Kings," into Persian verse. Shortly after commencing this work Daḳīḳī was murdered in the prime of life; his death was soon followed by the fall of the Sāmānid dynasty itself. But Daḳīḳī's great enterprise was not abandoned; a stronger hand, a higher genius, was to continue and to complete it, and this genius was found in Firdousī (940–1020; 328–411 A.H.), with whom we

Firdousi.

enter the golden age of the national epopee in Persia (see FIRDOUSĪ). In 1011, after thirty-five years of unremitting labour, he accomplished his gigantic task, and wrote the last distichs of the immortal *Shāhnāma*, that "glorious monument of Eastern genius and learning," as Sir W. Jones calls it, "which, if ever it should be generally understood in its original language, will contest the merit of invention with Homer itself." The *Shāhnāma*, from the very moment of its appearance, exercised such an irresistible fascination upon all minds that there was soon a keen competition among the younger poets as to who should produce the most successful imitation of that classic model; and this competition has gone on under different forms through all the following centuries, even to the most recent times. First of all, the old popular traditions, so far as they had not yet been exhausted by Firdousī, were ransacked for new epic themes, and a regular cycle of national epopees gathered round the *Book of Kings*, drawn almost exclusively from the archives of the princes of Sejistān, the family of Firdousī's greatest hero, Rustam. The first and most ambitious of these competitors seems to have been Asadī's own son, 'Alī b. Aḥmad al-Asadī, the author of the oldest Persian glossary, who completed in 1066 (458 A.H.), in upwards of 9000 distichs, the *Garshāspnāma*, or marvellous story of the warlike feats and love adventures of Garshāsp, one of Rustam's ancestors. The heroic deeds of Rustam's grandfather were celebrated in the *Sāmnāma*, which almost equals the *Shāhnāma* in length; those of Rustam's two sons, in the *Jahāgaīrnāma* and the *Farāmurznāma*; those of his daughter, an amazon, in the Brunhild style of the German Nibelunge, in the *Bānū Gushāspnāma*; those of his grandson in the *Barsūnāma*; those of his great-grandson in the *Shahriyārnāma* (ascribed to Mukhtārī and dedicated to Mas'ūd Shāh, who is probably identical with Mas'ūd b. Ibrāhīm, Sultan Maḥmūd's great-grandson, 1099–1114; 492–508 A.H.); and the wonderful exploits

Imitations of the "Shāhnāma."

of a son of Isfandiyār, another hero of the *Shāhnāma*, in the *Bahmannāma*.

When these old Iranian sources were almost exhausted, the difficulty was met in various ingenious ways. Where some slight historical records of the heroic age were still obtainable poetical imagination seized upon them at once; where no traditions at all were forthcoming fiction pure and simple asserted its right; and thus the national epopee gave way to the epic story, and—substituting prose for verse—to the novel and the fairy tale. Models of the former class are the various *Iskandarnāmas*, or "Books of Alexander the Great," the oldest and most original of which is that of Niẓāmī of Ganja, the modern Elizavetpol (completed about 1202; 599 A.H.); the latter begins with the *Kitāb-i-Samak 'Iyār*, a novel in three volumes (about 1189; 585 A.H.), and reaches its climax in the *Būstān-i-Khayāl*, or "Garden of Imagination," a prose romance of fifteen large volumes, by Mahommed Taḳī Khayāl, written between 1742 and 1756 (1155 and 1169 A.H.). Some writers, both in prose and verse, turned from the exhausted fields of the national glory of Persia, and chose their subjects from the chivalrous times of their own Bedouin conquerors, or even from the Jewish legends of the Koran. Of this description are the *Anbiyānāma*, or history of the pre-Mahommedan prophets, by Ḥasanī Shabistarī 'Ayānī (before the 8th century of the Hegira); Ibn Ḥusām's *Khāwarnāma* (1427; 830 A.H.), of the deeds of 'Alī; Bādhil's *Ḥamla-i-Haidarī*, which was completed by Najaf (1723; 1135 A.H.), or the life of Mahommed and the first four caliphs; Kāẓim's *Faraḥnāma-i-Fāṭima*, the book of joy of Fāṭima, Mahomet's daughter (1737; 1150 A.H.)—all four in the epic metre of the *Shāhnāma*; and the prose stories of *Ḥātim Ṭā'ī*, the famous model of liberality and generosity in pre-Islamitic times; of *Amīr Ḥamzah*, the uncle of Mahomet; and of the *Mu'jizāt-i-Mūsawī*, or the miraculous deeds of Moses, by Mu'īn-almiskīn (died about 1501; 907 A.H.).

Quite a different turn was taken by the ambition of another class of imitators of Firdousī, especially during the last four centuries of the Hegira, who tried to create a new heroic epopee by celebrating in rhythm and rhyme

Later Epics.

stirring events of recent date. The gigantic figure of Tīmūr inspired Hātifī (d. 1521; 927 A.H.) with his *Tīmūrnāma*; the stormy epoch of the first Ṣafawid rulers, who succeeded at last in reuniting for some time the various provinces of the old Persian realm into one great monarchy, furnished Ḳāsimī (died after 1560; 967 A.H.)[1] with the materials of his *Shāhnāma*, a poetical history of Shāh Isma'īl and Shāh Ṭahmāsp. Another *Shāhnāma*, celebrating Shāh 'Abbās the Great, was written by Kamālī of Sabzevār; and even the cruelties of Nādir Shāh were duly chronicled in a pompous epic style in 'Ishratī's *Shāhnāma-i-Nādirī* (1749; 1162 A.H.). But all these poems are surpassed in length by the 33,000 distichs of the *Shāhinshāhnāma* by the poet-laureate of Fatḥ 'Alī Shāh of Persia (1797–1834), and the 40,000 distichs of the *Georgenāma*, a poetical history of India from its discovery by the Portuguese to the conquest of Poona by the English in 1817. In India this kind of epic versification has flourished since the beginning of Humāyūn's reign (1530–1556); *e.g.* the *Ẓafarnāma-i-Shāhjahānī* by Ḳudsī (d. 1646; 1056 A.H.); the *Shāhinshāhnāma* by Ṭālib Kalīm (d. 1651; 1061 A.H.), another panegyrist of Shāh Jahān; Ātashī's *'Adilnāma*, in honour of Shāh Mahommed 'Ādil of Bījāpūr, who ascended the throne in 1629 (1039 A.H.) or 1627; the *Tawārīkh-i-Ḳulī Ḳuṭbshāh*, a metrical history of the Ḳuṭb shāhs of Golconda; and many more, down to the *Fatḥnāma-i-Tīpū Sulṭān* by Ghulām Ḥasan (1784; 1198 A.H.).

But the national epopee was not the only bequest the great Firdousī left to his nation. This rich genius gave also the first impulse to *romantic, didactic* and *mystic poetry*; and even his own age produced powerful co-operators in these three most conspicuous departments of Persian literature.

Romantic Fiction.

Romantic fiction, which achieved its highest triumph in Niẓāmī of Ganja's (1141–1203; 535–599 A.H.) brilliant pictures of the struggles and passions in the human heart

[1] After 1572 (979 A.H.), according to H. E. in *Grundriss*, ii. 237.

4. *New Persian.*—The last step in the development of the language is New Persian, represented in its oldest form by Firdousī.

New Persian.

In grammatical forms it is still poorer than Middle Persian; except English, no Indo-European language has so few inflexions, but this is made up for by the subtle development of the syntax. The structure of New Persian has hardly altered at all since the *Shāhnāma*; but the original purism of Firdousī, who made every effort to keep the language free from Semitic admixture, could not long be maintained. Arabic literatnre and speech exercised so powerful an influence on New Persian, especially on the written language, that it could not withstand the admission of an immense number of Semitic words. There is no Arabic word which would be refused acceptance in good Persian. But, nevertheless, New Persian has remained a language of genuine Iranian stock.

Among the changes of the sound system in New Persian, as contrasted with earlier periods, especially with Old Persian, the first that claims mention is the change of the tenues *k, t, p, c,* into *g, d, b, z.* Thus we have—

Old Persian or Zend.	*Pahlavi.*	*New Persian.*
mahrka (death)	mark	marg
Thraētaona	Fritūn	Feridūn
āp (water)	āp	āb
hvatō (self)	khōt	khōd
raucah (day)	rōj	rūz
haca	aj	az.

A series of consonants often disappear in the spirant; thus—

Old Persian or Zend.	*Pahlavī.*	*New Persian.*
kaufa (mountain)	kof	kōh
gāthu (place), Z. gātu	gās	gāh
cathware (four)	....	eihār
hañdaka (slave)	bandak	bandah
spāda (army)	....	sipāh
dadāmi (I give)	....	diham.

Old *d* and *dh* frequently become *y*—

Old Persian or Zend.	*Pahlavī.*	*New Persian.*
madhu (wine)	....	mai
baodhō (consciousness)	bōd	bōi
pādha (foot)	....	pāi
kadha (when)	....	kai.

Old *y* often appears as *j*: Zend *yāma* (glass), New Persian *jām*; *yavan* (a youth), New Persian *javān*. Two consonants are not allowed to stand together at the beginning of a word; hence vowels are frequently inserted or prefixed, *e.g.* New Persian *sitādan* or *istādan* (to stand), root *stā*; *birādar* (brother), Zend and Pahlavi *brātar*.[1]

Amongst modern languages and dialects other than Persian which must be also assigned to the Iranian family may be mentioned:—

Modern Dialects.

1. *Kurdish*, a language nearly akin to New Persian, with which it has important characteristics in common. It is chiefly distinguished from it by a marked tendency to shorten words at all costs, *e.g.* Kurd. *berā* (brother) = New Persian *birādar*; Kurd. *dim* (I give) = New Persian *diham*; Kurd. *spī* (white) = New Persian *sipēd*.

2. *Baluch*, the language of Baluchistan, also very closely akin to New Persian, but especially distinguished from it in that all the old spirants are changed into explosives, *e.g.* Baluch *vāb* (sleep) = Zend *hvafna*; Baluch *kap* (slime) = Zend *kafa*, New Persian *haf*; Baluch *hapt* (seven) = New Persian *haft*.

3. *Ossetic*, true Iranian, in spite of its resemblance in sound to the Georgian.[2]

4. *Pushtu* (less accurately Afghan), which has certainly been increasingly influenced by the neighbouring Indian languages in inflexion, syntax and vocabulary, but is still at bottom a pure Iranian language, not merely intermediate between Iranian and Indian.

The position of *Armenian* remains doubtful. Some scholars attribute it to the Iranian family; others prefer to regard it as a separate and independent member of the Indo-European group. Many words that at first sight seem to prove its Iranian origin are only adopted from the Persian.[3] (K. G.)

II. *Modern Persian Literature.*—Persian historians are greatly at variance about the origin of their national poetry. Most of them go back to the 5th Christian century and ascribe to one of the Sassanian kings, Bahrām V. (420–439), the invention of metre and rhyme; others mention as author of the first Persian poem a certain Abulhafs of Soghd, near Samarkand. In point of fact, there is no doubt that the later Sassanian rulers fostered the literary spirit of their nation (see PAHLAVĪ). Pahlavī books, however, fall outside of the present subject, which is the literature of the idiom which shaped itself out of the older Persian speech by slight modifications and a steadily increasing mixture of Arabic words and phrases in the 9th and 10th centuries of our era, and which in all essential respects has remained the same for the last thousand years. The death of Hārūn al-Rashīd in the beginning of the 9th century, which marks the commencement of the decline of the caliphate, was at the same time the starting-point of movements for national independence and a national literature in the Iranian dominion, and the common cradle of the two was in the province of Khorāsān, between the Oxus and the Jaxartes. In Merv, a Khorāsānian town, a certain 'Abbās composed in 809 A.D. (193 A.H.), according to the oldest biographical writer of Persia, Mahommed 'Aufī, the first real poem in modern Persian, in honour of the Abbāsid prince Mamūn, Hārūn al-Rashīd's son, who had himself a strong predilection for Persia, his mother's native country, and was, moreover, thoroughly imbued with the freethinking spirit of his age. Soon after this, in 820 (205 A.H.), Ṭāhir, who aided Mamūn to wrest the caliphate from his brother Amīn, succeeded in establishing the first semi-independent Persian dynasty in Khorāsān, which was overthrown in 872 (259 A.H.) by the Ṣaffārids.

Earliest Modern Persian Poet.

The development of Persian poetry under these first native dynasties was slow. Arabic language and literature had gained too firm a footing to be supplanted at once by a new literary idiom still in its infancy; nevertheless the few poets who arose under the Ṭāhirids and Ṣaffārids show already the germs of the characteristic tendency of all later Persian literature, which aims at amalgamating the enforced spirit of Islamism with their own Aryan feelings, and reconciling the strict deism of the Mahommedan religion with their inborn loftier and more or less pantheistic ideas; and we can easily trace in the few fragmentary verses of men like Ḥanzala, Ḥakīm Fīrūz and Abū Salīk those principal forms of poetry now used in common by all Mahommedan nations—the forms of the *qaṣīda* (the encomiastic, elegiac or satirical poem), the *ghazal* or ode (a love-ditty, wine-song or religious hymn), the *rubā'ī* or quatrain (our epigram, for which the Persians invented a new metre in addition to those adopted from the Arabs), and the *mathnawī* or double-rhymed poem (the legitimate form for epic and didactic poetry). The first who wrote such a mathnawī was Abū Shukūr of Balkh, the oldest literary representative of the third dynasty of Khorāsān, the Sāmānids, who had been able in the course of time to dethrone the Ṣaffārids, and to secure the government of Persia, nominally still under the supremacy of the caliphs in Bagdad, but in fact with full sovereignty. The undisputed reign of this family dates from the accession of Amīr Naṣr II. (913–942; 301–331 A.H.), who, more than any of his predecessors, patronized arts and sciences in his dominions.

Forms of Eastern Poetry.

The most accomplished minstrels of his time were Mahommed Farālādī (or Farālāwī); Abū 'l-'Abbās of Bokhārā, a writer of very tender verses; Abū 'l-Muẓaffar Naṣr of Nīshāpūr; Abū 'Abdallāh Mahommed of Junaid, equally renowned for his Arabic and Persian poetry; Ma'nawī of Bokhārā, full of original thoughts and spiritual subtleties; Khusrawānī, from whom even Firdousī condescended to borrow quotations; Abū 'l-Hasan Shahīd of Balkh, the first who made a dīwān or alphabetical collection of his lyrics; and Rūdagī (or Rūdakī), the first classic genius of Persia, who impressed upon every form of lyric and didactic poetry its peculiar stamp and individual character (see RŪDAGĪ). His graceful and captivating style was imitated by Ḥakīm Khabbaz of Nīshāpūr, a great baker, poet and quack; Abū Shu'aib Ṣāliḥ of Herāt, who left a spirited little song in honour of a young Christian maiden; Raunaqī of Bokhārā; Abū'l-Fatḥ of Bust, who was also a good Arabic poet; the amīr Abū 'l-Ḥasan 'Alī Alagātchī, who handled the pen as skilfully as the sword; 'Umāra of Merv, a famous

Minstrels of 10th Century.

the *Gulistan*, or "Rose-garden." However, both have found comparatively few imitations—the former in the *Dastūrnāma*, or "Book of Exemplars," of Nizārī of Kohistān (d. 1320; 720 A.H.), in the *Dah Bāb*, or "Ten Letters," of Kātibī (d. 1434; 838 A.H.), and in the *Gulzār*, or "Rose-bower," of Hairatī (murdered 1554; 961 A.H.); the latter in Mu'īn-uddīn Juwainī's *Nigāristān*, or "Picture-gallery" (1335; 735 A.H.) and Jāmī's *Bahāristān*, or "Spring-garden" (1487; 892 A.H.); whereas an innumerable host of purely Ṣūfic compositions followed in the wake of Sanā'ī's, 'Aṭṭar's and Jelāl ud-dīn Rumī's mathnawīs. It will suffice to name a few of the most conspicuous.

Sa'dī.

Further Sūfic Works.

The *Lama'āt*, or "Sparks," of 'Irāḳī (d. between 1287 and 1309; 686 and 709 A.H.), the *Zād-ulmusāfirīn*, or "Store of the Wayfarers," by Husainī (d. 1318; 718 A.H.), the *Gulshan-i-Rāz*, or "Rose-bed of Mystery," by Maḥmūd Shabistarī (d. 1320; 720 A.H.), the *Jām-i-Jam*, or "Cup of Jamshīd," by Auḥadī (d. 1338; 738 A.H.), the *Anīs-ul 'Arifīn*, or "Friend of the Mystics," by Ḳāsim(Qāsim)-i-Anwār (d. 1434; 837 A.H.), and others; 'Aṣṣār's *Mihr u Mushtarī*, or "Sun and Jupiter" (1376; 778 A.H.), 'Ārifī's *Gūi u Chaugān*, or "The Ball and the Bat" (1438; 842 A.H.), *Husn u Dil*, or "Beauty and Heart," by Fattāhī of Nīshāpūr (d. 1448; 852 A.H.), *Sham' u Parwāna*, or "The Candle and the Moth," by Ahlī of Shīrāz (1489; 894 A.H.), *Shāh u Gadā*, or "King and Dervish," by Hilālī (put to death 1532; 939 A.H.), Bahā-ud-dīn 'Amilī's (d. 1621; 1030 A.H.) *Nān u Halwā*, or "Bread and Sweets," *Shīr u Shakar*, or "Milk and Sugar," and many more.

Lyric Poetry.

During all these periods of literary activity, *lyric* poetry, pure and simple, had by no means been neglected; almost all the renowned poets since the time of Rūdagī had sung in endless strains the pleasures of love and wine, the beauties of nature, and the almighty power of the Creator; but it was left to the incomparable genius of Ḥāfiẓ (d. 1389; 791 A.H.; see ḤĀFIẒ) to give to the world the most perfect models of lyric composition; and the lines he had laid down were more or less strictly followed by all the ghazal-writers of the 9th and 10th centuries of the Hegira—by Salmān of Sāwa (d. about 1377; 779 A.H.), who excelled besides in ḳasīda and mathnawī; Kamāl Khujandī (d. 1400; 803 A.H.), Ḥāfiẓ's friend, and protégé of Sultan Ḥosain (1374–1382 A.D.); Mahommed Shīrīn Maghribī (d. at Tabrīz in 1406; 809 A.H.), an intimate friend of Kamāl; Ni'mat-ullāh Walī (d. 1431; 834 A.H.), the founder of a special religious order; Ḳāsim-i-Anwār (see above); Amīr Shāhī (d. 1453; 857 A.H.), of the princely family of the Sarbadārs of Sabzewār; Bannā'ī (d. 1512; 918 A.H.), who also wrote a romantic poem, *Bahrām u Bihrūz*; Bābā Fighānī of Shīrāz (d. 1519; 925 A.H.), usually called the "Little Ḥāfiẓ"; Nargisī (d. 1531; 938 A.H.); Lisānī (d. 1534; 941 A.H.), who himself was imitated by Damīrī of Iṣfahān, Muḥtashain Kāshī and Waḥshī Bāfiḳī (all three died in the last decade of the 10th century of the Hegira); Ahlī of Shīrāz (d. 1535; 942 A.H.), author of the *Siḥr-i-Ḥalāl*, or "Lawful Witchcraft," which, like Kātibī's (d. 1434; 838 A.H.) *Majma'-ulbaḥrain*, or the "Confluence of the Two Seas," can be read in two different metres; Nau'ī (d. 1610; 1019 A.H.), who wrote the charming romance of a Hindu princess who burned herself in Akbar's reign with her deceased husband on the funeral pile, called *Sūz u Gudāz*, or "Burning and Melting," &c. Among the immediate predecessors of Ḥāfiẓ in the 8th century of the Hegira, in which also Ibn Yamīn, the great ḳiṭ'a-writer,[1] flourished, the highest fame was gained by the two poets of Delhi, Amīr Ḥasan and Amīr Khosrau. The latter, who died in 1325 (725 A.H.), two years before his friend Ḥasan, occupies the foremost place among all the Persian poets of India by the richness of his imagination, his graphic style, and the historical interest attached to his writings. Five extensive dīwāns testify to his versatility in all branches of lyric poetry, and nine large mathnawīs to his mastership in the epic line. Four of the latter are poetical accounts of the reigns of the emperors of Delhi, 'Alā-uddīn Khiljī (1296–1316), his predecessor Feroz Shāh and his successor Ḳuṭb-uddīn Mubārek Shah—the *Miftāh-ulfutūh*, or "Key of Victories," the *Kirān-ussa'dain*, or "The Conjunction of the Two Lucky Planets," the *Nuh Sipihr*, or "Nine Spheres," and the love-story of *Khidrkhān u Duwalrānī*. His other five mathnawīs formed the first attempt ever made to imitate Niẓāmī's famous *Khamsah*, or five romantic epopees, and this attempt turned out so well that henceforth almost all epic poets wrote quintuples of a similar description. Khwājū Kirmānī (d. 1352; 753 A.H.) was the next aspirant to Niẓāmī's fame, with five mathnawīs, among which *Humāi u Humāyūn* is the most popular, but he had to yield the palm to 'Abd-urraḥmān Jāmī (1414–1492; 817–898 A.H.), the last classic poet of Persia, in whose genius were summed up all the best qualities of his great predecessors.

Ghazal-writers.

Jāmī and Later Poets.

Many poets followed in Jāmī's footsteps, first of all his nephew Hātifī (see above), and either wrote whole khamsahs or imitated at least one or other of Niẓāmī's epopees; thus we have a *Lailā u Majnūn*, for instance, by Maktabī (1490), Hilālī (see above), and Rūḥ-ulamīn (d. 1637). But their efforts could not stop the growing corruption of taste, and it was only at the court of the Mogul emperors, particularly of the great Akbar (1556–1605), who revived Sultan Maḥmūd's "round table," that Persian literature still enjoyed some kind of "Indian summer" in poets like Ghazālī of Mashhad or Meshed (d. 1572); 'Urfī of Shīrāz (d. 1591), who wrote spirited ḳasīdas, and, like his contemporaries Waḥshī and Kautharī, a mathnawī, *Farhād u Shīrīn*; and Faiḍī (d. 1595), the author of the romantic poem, *Nal u Daman*, who also imparted new life into the rubā'ī. In Persia proper only Zulālī, whose clever romance of "Sultan Maḥmūd and his favourite Ayāz" (1592) is widely read in the East, Ṣā'ib (d. 1677), who is commonly called the creator of a new style in lyric poetry, and, among the most modern, Hātif of Iṣfahān, the singer of sweet and tasteful odes (died about 1785), deserve a passing notice.

The Drama.

But we cannot conclude our brief survey of the national literature of Persia without calling attention to the rise of the *drama*, which has only sprung up in the beginning of the nineteenth century. Like the Greek drama and the mysteries of the European middle ages, it is the offspring of a purely religious ceremony, which for centuries has been performed annually during the first ten days of the month Muharram—the recital of mournful lamentations in memory of the tragic fate of the house of the caliph 'Alī, the hero of the Shī'itic Persians. Most of these passion-plays deal with the slaughter of 'Alī's son Ḥosain and his family in the battle of Kerbelā. But lately this narrow range of dramatic subjects has been considerably widened, Biblical stories and even Christian legends have been brought upon the Persian stage; and there is a fair prospect of a further development of this most interesting and important movement. (See further DRAMA : *Persian*.)

Historical Works.

In the various departments of general Persian literature not touched upon in the foregoing pages the same wonderful activity has prevailed as in the realm of poetry and fiction, since the first books on history and medicine appeared under the Sāmānids (see above). The most important section is that of historical works, which, although deficient in sound criticism and often spoiled by a highly artificial style, supply us with most valuable materials for our own research. Quite unique in this respect are the numerous histories of India, from the first invasion of Sultan Maḥmūd of Ghazni to the English conquest, and even to the first decades of the present century, most of which have been described and partly translated in the eight volumes of Sir H. M. Elliot's *History of India* (1867–1878). Persian writers have given us, besides, an immense variety of universal histories of the world, with many curious and noteworthy data (see, among others, Mīrkhond's and Khwāndamīr's works under MĪRKHOND); histories of Mahomet and the first caliphs, partly translated from Arabic originals, which have been lost; detailed accounts of all the Persian dynasties, from the Ghaznevids to the still reigning Kajars, of Jenghiz Khān and the Moguls (in Juwainī's and Waṣṣāf's elaborate *Ta'rīkhs*), and

[1] A ḳiṭ'a or muḳaṭṭa'a is a poem containing moral reflections, and differs from the ḳasīda and ghazal only by the absence of a maṭla' or initial distich.

of Tīmūr and his successors (see an account of the *Zafarnāma* under PETIS DE LA CROIX); histories of sects and creeds, especially the famous *Dabistān*, or "School of Manners" (translated by Shea and Troyer, Paris 1843); and many local chronicles of Iran and Tūrān. Next in importance to history rank geography, cosmography, and travels (for instance, the *Nuzhat-ulkulūb*, by Ḥamdallah Mustaufī, who died in 1349, and the translations of Istakhrī's and Kazvīnī's Arabic works), and the various *tadhkiras* or biographies of Ṣūfīs and poets, with selections in prose and verse, from the oldest of 'Aufī (about 1220) to the last and largest of all, the *Makhzan-ulgharā'ib*, or "Treasure of Marvellous Matters" (completed 1803), which contains biographies and specimens of more than 3000 poets. We pass over the well-stocked sections of philosophy, ethics and politics, of theology, law and Ṣūfīsm, of mathematics and astronomy, of medicine (the oldest thesaurus of which is the "Treasure of the shāh of Khwārizam," 1110), of Arabic, Persian and Turkish grammar and lexicography, and only cast a parting glance at the rich collection of old Indian folk-lore and fables preserved in the Persian version of *Kalīlah u Dimnah* (see RŪDAGĪ), of the *Sindbād-nāma*, the *Ṭūtīnāma*, or "Tales of a Parrot," and others, and at the translations of standard works of Sanskrit literature, the epopees of the *Rāmāyana* and *Mahābhārata*, the *Bhagavad-Gītā*, the *Yoga-Vasishtha*, and numerous *Purānas* and *Upanishads*, for which we are mostly indebted to the emperor Akbar's indefatigable zeal.

Indian Folk-lore.

AUTHORITIES.—The standard modern discussions of Persian literature are those of E. G. Browne, *Literary History of Persia* (1902, seq.), and Hermann Ethé, in vol. ii. of Geiger and Kuhn's *Grundriss der iranischen Philologie* (Strassburg, 1906); also the latter's *Höfische und romantische Poesie der Perser* (1887), and *Mystische, didaktische und lyrische Poesie und das spätere Schriftthum der Perser* (1888). See also P. Horn, *Geschichte der persischen Litteratur* (1901). Concise sketches of Persian poetry are contained in Sir G. Ouseley's *Biographical Notices of Persian Poets* (1846); in G. L. Flügel's article in Ersch and Gruber's *Allgemeine Encyklopädie* (1842); in N. Bland's papers in the *Journ. of the Roy. As. Soc.*, vii. 345 seq. and ix. 122 seq.; and in C. A. C. Barbier de Meynard's *Poésie en Perse* (Paris, 1877). Real mines of information are the catalogues of A. Sprenger (Calcutta, 1854); W. H. Morley (London, 1854); Flugel (3 vols., Vienna, 1865); and C. Rieu (3 vols., London, 1879-1883). For the first five centuries of the Hegira compare Ethé's editions and metrical translations of "Rūdagī's Vorläufer und Zeitgenossen," in *Morgenländische Forschungen* (Leipzig, 1875); of Kisā'ī's songs, Firdousī's lyrics, and Abū Sa'īd b. Abū 'l-Khair's rubā'īs, in *Sitzungsberichte der bayr. Akademie* (1872, p. 275 seq.; 1873, p. 622 seq.; 1874, p. 133 seq.; 1875, p. 145 seq.; and 1878, p. 38 seq.); of Avicenna's Persian poems, in *Göttinger Nachrichten* (1875, p. 555 seq.); and of Asadī and his munāẓarāt, in "Persische Tenzonen," *Verhandlungen des 5ten Orientalisten-Congresses* (Berlin, 1882, pt. ii., first half, p. 48 seq.); H. Zotenberg's *Chronique de Tabari* (Paris, 1867–1874); Jurjanī's *Wīs u Rāmīn*, ed. in the *Bibl. Indica* (1864) (trans. into German by C. H. Graf in *Zeitschrift der morgenländischen Gesellschaft*, xxiii. 375 seq.); and A. de B. Kasimirski's *Spécimen du dīwān de Menoutchehri* (Versailles, 1876). On Khākāni, see N. de Khanykoff's "Mémoire," in *Journal asiatique*, 6th series, vol. iv. p. 137 seq. and vol. v. p. 296 seq., and C. Salemann's edition of his rubā'īs, with Russian trans. (Petersburg, 1875); on Farīd uddīn 'Aṭṭār, S. de Sacy's edition of the *Pandnāma* (Paris, 1819), and Garcin de Tassy's *Mantiḳ-uṭṭair* (Paris, 1857); on the *Gulshan-i-rāz*, E. H. Whinfield's edition (London, 1880); and on Amīr Khosrau's mathnawīs, the abstracts given in Elliot's *History of India*, iii. 524 seq. German translations of Ibn Yamīn were published by O. Schlechta-Wssehrd, *Bruchstücke* (Vienna, 1852); of Jāmī's minor poems, by V. von Rosenzweig (Vienna, 1840); by F. Rückert, in *Zeitschrift fur die Kunde des Morgenlandes*, vols. v. and vi., and *Zeitschrift der d. morgenl. Gesellsch.*, vols. ii., iv., v., vi., xxiv., xxv. and xxix.; and by M. Wickerhauser (Leipzig, 1855, and Vienna, 1858); German translation of *Yūsuf u Zalīkhā*, by Rosenzweig (Vienna, 1824), English by R. T. H. Griffith (London, 1881); French translation of *Lailā u Majnūn*, by A. L. de Chézy (Paris, 1805), German by A. T. Hartmann (Leipzig, 1807); Hilālī's "König und Derwisch," by Ethé, in *Morgenländ. Stud.* (Leipzig, 1870, p. 197 seq.). On the Persian drama, compare J. A. de Gobineau's *Religions et philosophies dans l'Asie centrale* (Paris, 1866); A. Chodzko's *Théâtre persan* (new ed., Paris, 1878); and Ethé, "Persische Passionspiele," in *Morgenländ. Stud.*, p. 174 seq. (H. E.)

PERSIGNY, JEAN GILBERT VICTOR FIALIN, DUC DE (1808–1872), French statesman, was born at Saint-German Lespinasse (Loire) on the 11th of January 1808, the son of a receiver of taxes. He was educated at Limoges, and entered the cavalry school at Saumur in 1826, becoming *maréchal des logis* in the 4th Hussars two years later. The share taken by his regiment in supporting the revolution of 1830 was regarded as insubordination, and next year Fialin was dismissed from the army. He became a journalist, and in 1833 became a strong Bonapartist, assuming the title of comte de Persigny, said to be dormant in his family. He planned the attempt on Strassburg in 1836 and that on Boulogne in 1840. At Boulogne he was arrested and condemned to twenty years' imprisonment in a fortress, shortly afterwards commuted into mild detention at Versailles, where he wrote a book to prove that the Pyramids were built to prevent the Nile from silting up. This was published in 1845 under the title, *De la Destination et de l'utilité permanente des Pyramides.* At the revolution of 1848 he was arrested by the provisional government, and on his release took a prominent part in securing the election of Louis Napoleon to the presidency. With Morny and the marshal Saint Arnaud he plotted the restoration of the empire, and was a devoted servant of Napoleon III. He succeeded Morny as minister of the interior in January 1852, and later in the year become senator. He resigned office in 1854, being appointed next year to the London embassy, which he occupied with a short interval (1858–1859) until 1860, when he resumed the portfolio of the interior. But the growing influence of his rival Rouher provoked his resignation in 1863, when he received the title of duke. A more dangerous enemy than Rouher was the empress Eugénie, whose marriage he had opposed and whose presence in the council chamber he deprecated in a memorandum which fell into the empress's hands. He sought in vain to see Napoleon before he started to take over the command in 1870, and the breach was further widened when master and servant were in exile. Persigny returned to France in 1871, and died at Nice on the 11th of January 1872.

See *Mémoires du duc de Persigny* (2nd ed., 1896), edited by H. de Laire d'Espagny, his former secretary; a eulogistic life, *Le Duc de Persigny* (1865), by Delaroa; and Émile Ollivier's *Empire libéral* (1895, &c.).

PERSIMMON, the name given to the fruits of *Diospyros virginiana* in the United States. The tree which bears them belongs to the order Ebenaceae, is usually from 30 to 50 ft. in height, and has oval entire leaves, and unisexual flowers on short stalks. In the male flowers, which are numerous, the stamens are sixteen in number and arranged in pairs; the female flowers are solitary, with traces of stamens, and a smooth ovary with one ovule in each of the eight cells—the ovary is surmounted by four styles, which are hairy at the base. The fruit-stalk is very short, bearing a subglobose fruit an inch or rather more in diameter, of an orange-yellow colour, and with a sweetish astringent pulp. It is surrounded at the base by the persistent calyx-lobes, which increase in size as the fruit ripens. The astringency renders the fruit somewhat unpalatable, but after it has been subjected to the action of frost, or has become partially rotted or "bletted" like a medlar, its flavour is improved. The fruit is eaten in great quantities in the southern states of America, and is also fermented with hops, corn-meal or wheat-bran into a sort of beer or made into brandy. The wood is heavy, strong and very close-grained and used in turnery. The tree is very common in the South Atlantic and Gulf states, and attains its largest size in the basin of the Mississippi. It was brought to England before 1629 and is cultivated, but rarely if ever ripens its fruit. It is easily raised from seed and can also be propagated from stolons, which are often produced in great quantity. The Chinese and Japanese cultivate another species, the *Diospyros Kaki*, of which there exist numerous ill-defined varieties. The fruits are larger than those of the American kind, variable in shape, but have similar properties. An astringent fluid, known as *shibu*, rich in tannin, is expressed from the green fruit and used in various industries. The tree is hardy in the south of England and in the Channel Islands.

PERSIS (mod. Fars, *q.v.*), the south-western part of Iran (Persia), named from the inhabitants, the Iranian people of the Pārsa (Fars); their name was pronounced by the Ionians *Persai*, with change from *a* to *e*, and this form has become dominant

in Greek and in the modern European languages. The natural features of Persis are described very exactly by Nearchus, the admiral of Alexander the Great (preserved by Arrian, *Indic.* 40 and Strabo xv. 727). The country is divided into three parts, of very different character and climate: the coast is sandy and very hot, without much vegetation except date-palms; it has no good harbours, and the climate is very unwholesome; the population is scanty. About 50 m. from the coast rise the chains of the mountains, through which some steep passes lead into the interior valleys (called *κοιλὴ Περσίς*, Strabo xv. 729), which lie about 5000 ft. above the sea. Here the climate is temperate, the country watered by many rivers and lakes, the soil fertile, the vegetation rich, the cattle numerous. These regions, which were thickly populated, form the real Persis of history. "This land Persis," says Darius, in an inscription at Persepolis, "which Ahuramazda has given to me, which is beautiful and rich in horses and men, according to the will of Ahuramazda and myself it trembles before no enemy." The third part is the north, which belongs to the central plateau, still much higher, and therefore rough and very cold in the winter. Towards the north-west it borders on the Median district of Paraetacene (about Isfahan); towards the north and north-east it soon passes into the great desert, of which only the oasis of Yezd (*Isatichai* in Ptolem. vi. 4, 2) is inhabitable. In the east, Persis proper is separated by a desert (Laristan) from the fertile province of Carmania (Kerman), a mountainous region inhabited by a Persian tribe. To Carmania belonged also the coast, with the islands and harbours of Hormuz and Bander Abbasi. In the west Persis borders on the mountains and plains of Elam or Susiana. For the ancient topography cf. Tomaschek, "Beiträge zur historischen Topographie von Persien," in *Sitzungsber. der wiener Akademie, phil. Cl.* cii. cviii. cxxi.

The Persians are not mentioned in history before the time of Cyrus; the attempt to identify them with the Parsua, a district in the Zagros chains south of Lake Urmia, often mentioned by the Assyrians, is not tenable. The Parsua are perhaps the non-Arian tribe Πάρσιοι in northern Media, Strabo xi. 508. Herodotus i. 125, gives a list of Persian tribes: the Pasargadae (at Murghab), Maraphii, Maspii, Panthialaei (in western Carmania), Derusiaci, Germanii (*i.e.* the Carmanians) are husbandmen, the Dahae (*i.e.* the "enemies," a general name of the rapacious nomads, used also for the Turanian tribes), Mardi, Dropici, Sagartii (called by Darius *Asagarta*, in the central desert; cf. Herod. vii. 85) are nomads. The kings of the Pasargadae, from the clan of the Achaemenidae, had become kings of the Elamitic district Anshan (probably in 596, cf. CYRUS). When, in 553, Cyrus, king of Anshan, rebelled against Astyages, the Maraphians and Maspians joined with the Pasargadae; after his victory over Astyages all the Persian tribes acknowledged him, and he took the title of "king of Persia." But from then only the inhabitants of Persis proper were considered as the rulers of the empire, and remained therefore in the organization of Darius free from taxes (Herod. iii. 97). But Carmania, with the Sagartians, the Utians (called by Darius *Yautiya*), and other tribes, formed a satrapy and paid tribute (Herod. iii. 93); the later authors therefore always distinguished between Carmania and Persis. Names of other Persian tribes, partly of very doubtful authority, are given by Strabo xv. 727,[1] and Ptolem. vi. 4 and 8.

The Persians of Cyrus (see PERSIA: *Ancient History*) were a vigorous race of husbandmen, living in a healthy climate, accustomed to hardship, brave and upright; many stories in Herodotus (especially ix. 122) point the contrast between their simple life and the effeminate nations of the civilized countries of Asia. They were firmly attached to the pure creed of Zoroaster (cf. Herod. i. 131 sqq. and the inscriptions of Darius).

When Darius had killed the usurper Smerdis and galned the crown, a new usurper, Vahyazdâta, who likewise pretended to be Smerdis, the son of Cyrus, rose in *Yautiya*, but was defeated in two battles by Darius's generals and put to death (Behistun inscription). Cyrus had built his capital with his palace and tomb, in Pasargadae (*q.v.*). Darius founded a new city about 30 m. farther south on the left bank of the Pulwar, near its confluence with the Kur, with a large terrace, on which his magnificent palace and that of his son Xerxes were built. As Pasargadae was named after the tribe in whose district it lay, so the new capital is by the Persians and Greeks simply called "the Persians"; later authors call it Persepolis (*q.v.*), "the Persian city." Another Persian palace lay in Taoke, near the coast (Strabo xv. 728; Arrian, *Ind.* 39; Dionys. Perieg. 1069); Gabae, which Strabo mentions besides, is Isfahan in Paraetacene and belonged already to Media).

Both in Persepolis and Pasargadae large masses of gold and silver from the tribute of the subject nations were treasured, as in Susa and Ecbatana. But Persis lies too far off from the centre of the Asiatic world to be the seat of government. Like Arabia and similar countries, it could exercise a great momentary influence in history and produce a sudden change throughout the world; but afterwards it would sink into local insignificance. So the Persian kings fixed their residence at Susa, which is always considered as the capital of the empire (therefore Aeschylus wrongly considers it as a Persian town and places the tomb of Darius here). After the reign of Xerxes, Persis and Persepolis became utterly neglected, in spite of occasional visits, and even the palaces of Persepolis remained in part unfinished. But the national feeling of the Persians remained strong. When Alexander had won the victory of Arbela, and occupied Babylon and Susa, he met (in the spring of 330) with strong resistance in Persia, where the satrap Ariobarzanes tried to stop his progress at the "Persian gates," the pass leading up to Persepolis. Here he set fire to the cedar roof of the palace of Xerxes as a symbol that the Greek war of revenge against the Persians had come to an end. Our best information tells us that he soon had the fire extinguished (Plut. *Alex.* 38); the story of Thais is a pure fiction, and we may well believe that he repented the damage he had done (Arrian vi. 30, 1).

Alexander had planned to amalgamate the former rulers of the world with his Macedonians; but his death was followed by a Macedonian reaction. Peucestas, the new satrap of Persis, followed the example of Alexander, and thus gained a strong hold on his subjects (Diod. xix. 48); nor did Seleucus, to whom the dominion of the east ultimately passed (from 311 onwards), disdain the aid of the Persians; he is the only one among the Diadochi who retained his Persian wife, Apame, daughter of Spitamenes. At the same time Seleucus and his son Antiochus I. Soter tried to introduce Hellenism into Persis. Of Greek towns which they founded here we know Alexandria in Carmania (Plin. vi. 107; Ptol. vi. 8, 14; Ammian. Marc. 23, 6, 49), Laodicea in the east of Persis (Plin. 6, 115), Stasis, "a Persian town on a great rock, which Antiochus, the son of Seleucus, possessed" (Steph. Byz. *s.v.*), Antiochia in Persis, founded apparently by Seleucus I. and peopled by Antiochus I. with immigrants called together from all Greece, as we learn from a *psephisma* passed by "boulē and demos" of this town in 206 in honour of Magnesia on the Maeander (Kern, *Inschriften von Magnesia am Maeander*, No. 61 = Dittenberger, *Orientis gr. inscr.* 233, where they are mentioned together with a great many Seleucid towns in Susiana and Babylonia, and compare Kern, No. 18 = Dittenberger, No. 231). An insurrection of the Persians against Seleucus (II.) is mentioned in two stratagems of Polyaenus (vii. 39. 40). When in 221 Molon, the satrap of Media, rebelled against Antiochus III., his brother Alexander, satrap of Persis, joined him, but they were defeated and killed by the king. Persis remained a part of the Seleucid empire down to Antiochus IV. Epiphanes, who at the end of his reign restored once more the authority of the empire in Babylonia, Susiana and Persis; perhaps a battle, in which the satrap Numenius of Mesene (southern Babylonia) defeated the Persians on the shore of Carmania on sea and land (Plin. vi. 152), belongs to this time. But after the death of Antiochus IV. (164) the

[1] To the Pateiskhoreis belongs the lance-bearer of Darius, "Gobryas (Gaubaruva) the Pâtishuvari," mentioned in his tomb-inscription; they occur also in an inscription of Esarhaddon as Patush-ara, eastwards of Media, in Choarene at the Caspian gates; the Kyrtii are the Kurds.

Seleucid Empire began to dissolve. While the central provinces, Media and northern Babylonia, were conquered by the Parthians, Mesene, Elymais and Persis made themselves independent.

Persis never became a part of the empire of the Arsacids, although her kings recognized their supremacy when they were strong (Strabo xv. 728, 736). From the periplus of the Erythraean Sea 33-37 we learn that their authority extended over the shores of Carmania and the opposite coasts of Arabia. A Persian king, Artaxerxes, who was murdered by his brother Gosithros at the age of 93 years, is mentioned in a fragment of Isidore of Charax (Lucian, *Macrobii*, 15). Other names occur on their coins, the oldest of which are imitations of Seleucid coins, and were perhaps struck by local dynasts under their supremacy; most of the others show the king's head with the Perisan tiara, and on the reverse a fire-altar with the adoring king before it, a standard (perhaps the famous banner of the smith Kavi, which became the standard of Iran under the Sassanids), and occasionally the figure of Ahuramazda; they were first explained by A. D. Mordtmann in *Zeitschrift für Numismatik*, iii., iv. and vii.; cf. *Grundriss der iranischen Philol.* ii. 486 seq. The legends are in Aramaic characters and Persian (Pahlavi) language; among them occur Artaxerxes, Darius (from a dynast of this name the town Darabjird, "town of Darius," in eastern Persia seems to derive its name), Narses, Tiridates, Manocihr and others; the name Vahuburz seems to be identical with Oborzos, mentioned by Polyaenus vii. 40, who put down a rebellion of 3000 settlers (κάτοικοι) in Persis. From the traditions about Ardashir I. we know that at his time there were different petty kingdoms and usurpers in Persis; the principal dynasty is by Tabari called Bāzrangi. The coins demonstrate that Hellenism had become quite extinct in Persis, while the old historical and mythical traditions and the Zoroastrian religion were supreme. There can be no doubt that at this time the true form of Zoroastrianism and the sacred writings were preserved only in Persis, whereas everywhere else (in Parthia, in the Indo-Scythian kingdoms of the east and in the great propagandist movement in Armenia, Syria and Asia Minor, where it developed into Mithraism) it degenerated and was mixed with other cults and ideas. So the revival of Zoroastrianism came from Persis. When Ardashir I. attempted to restore the old empire of Cyrus and Darius, and in 212 A.D. rose against the Parthian king, Artabanus, his aim was religious as well as political. The new Sassanid Empire which he founded enforced the restored religion of Zoroaster (Zarathustra) on the whole of Iran.

The new capital of Persis was Istakhr on the Pulwar, about 9 m. above Persepolis, now Hajjiahād, where even the predecessors of Ardashir I. are said to have resided. It was a great city under the Sassanids, of which some ruins are extant. But it shared the fate of its predecessor; when the empire was founded the Sassanids could no longer remain in Persis but transferred their headquarters to Ctesiphon. (Ed. M.)

PERSIUS, in full Aulus Persius Flaccus (A.D. 34-62), Roman poet and satirist. According to the *Life* contained in the MSS., Persius was a native of Volaterrae, of good stock on both parents' side. When six years old he lost his father, and his step-father died in a few years. At the age of twelve Persius came to Rome, where he was taught by Remmius Palaemon and the rhetor Verginius Flavus. Four years later began a close intimacy with the Stoic Cornutus. In this philosopher's pupil Lucan, Persius found a generous admirer of all he wrote. Still in early youth he became the friend of the lyric poet Caesius Bassus, whilst with Thrasea Paetus (whose wife Arria was a relative) he had a close friendship of ten years' duration and shared some travels. Seneca he met later, and was not attracted by his genius. In his boyhood Persius wrote a tragedy dealing with an episode of Roman history, and a work, the title of which is rendered uncertain by corruption in our MSS. Pithou's generally accepted reading makes the subject that of travel; the excursions with Thrasea however must have taken place *after* boyhood. The perusal of Lucilius revealed to Persius his vocation, and he set to work upon a book of satires. But he wrote seldom and slowly; a premature death (*uitio stomachi*) prevented the completion of his task. He is described as possessed of a gentle disposition, girlish modesty and personal beauty, and living a life of exemplary devotion towards his mother Fulvia Sisenna, his sister and his aunt. To his mother and sister he left a considerable fortune. Cornutus suppressed all his work except the book of satires in which he made some slight alterations and then handed it over to Bassus for editing. It proved an immediate success.

The scholia add a few details—on what authority is, as generally with such sources, very doubtful. The *Life* itself, though not free from the suspicion of interpolation and undoubtedly corrupt and disordered in places, is probably trustworthy. The MSS. say it came from the commentary of Valerius Probus, no doubt a learned edition of Persius like those of Virgil and Horace by this same famous "grammarian" of Berytus, the poet's contemporary. The only case in which it seems to conflict with the *Satires* themselves is in its statement as to the death of Persius's father. The declaiming of a *suasoria* in his presence (*Sat.* 3. 4 sqq.) implies a more mature age than that of six in the performer. But *pater* might here mean "step-father," or Persius may have forgotten his own autobiography, may be simply reproducing one of his models. The mere fact that the *Life* and the *Satires* agree so closely does not of course prove the authenticity of the former. One of the points of harmony is, however, too subtle for us to believe that a forger evolved it from the works of Persius. It requires indeed a thoughtful reading of the *Life* before we realize how distinct is the impression it gives of a "bookish" youth, who has never strayed far, at least in spirit, from the domestic hearth and his women-folk. And of course this is notoriously the picture drawn by the *Satires*. So much better does Persius know his books than the world that he draws the names of his characters from Horace. A keen observer of what occurs within his narrow horizon, he cannot but discern the seamy side of life (cf. *e.g.* such hints as *Sat.* iii. 110); he shows, however, none of Juvenal's undue stress on unsavoury detail or Horace's easy-going acceptance of human weaknesses. The sensitive, home-bred nature of Persius shows itself perhaps also in his frequent references to ridicule, whether of great men by street *gamins* or of the cultured by Philistines.

The chief interest of Persius's work lies in its relation to Roman satire, in its interpretation of Roman Stoicism, and in its use of the Roman tongue. The influence of Horace on Persius can, in spite of the silence of the *Life*, hardly have been less than that of Lucilius. Not only characters, as noted above, but whole phrases, thoughts and situations come direct from him. The resemblance only emphasizes the difference between the caricaturist of Stoicism and its preacher. Persius strikes the highest note that Roman satire reached; in earnestness and moral purpose rising far superior to the political rancour or good natured persiflage of his predecessors and the rhetorical indignation of Juvenal, he seems a forerunner of the great Christian Apologists. From him we learn a lesson Seneca never taught, how that wonderful philosophy could work on minds that still preserved the depth and purity of the old Roman *gravitas*. When the *Life* speaks of Seneca's genius as not attracting Persius, it presumably refers to Seneca the philosopher. Some of the parallel passages in the works of the two are very close, and hardly admit of explanation by assuming the use of a common source. With Seneca, Persius censures the styles of the day, and imitates it. Indeed in some of its worst failings, straining of expression, excess of detail, exaggeration, he outbids Seneca, whilst the obscurity, which makes his little book of not seven hundred lines so difficult to read and is in no way due to great depth of thought, compares very ill with the terse clearness of the *Epistolae morales*. A curious contrast to this tendency is presented by his free use of "popular" words. As of Plato, so of Persius we hear that he emulated Sophron; the authority is a late one (Lydus, *De mag.* 1. 41), but we can at least recognize in the scene that opens *Sat.* 3. kinship with such work as Theocritus' *Adoniazusae* and the *Mimes* of Herodas.

Persius's satires are composed in hexameters, except for the scazons of the short prologue above referred to, in which he half ironically asserts that he writes to earn his bread, not because he is inspired. The first satire censures the literary tastes of the day as a reflection of the decadence of the national morals. The theme of Seneca's 114th letter is similar. The description of the *recitator* and the literary twaddlers after dinner is vividly natural, but an interesting passage which cites specimens of smooth versification

and the languishing style is greatly spoiled by the difficulty of appreciating the points involved and indeed of distributing the dialogue (a not uncommon crux in Persius). The remaining satires handle in order (2) the question as to what we may justly ask of the gods (cf. Plato's second *Alcibiades*), (3) the importance of having a definite aim in life, (4) the necessity of self-knowledge for public men (cf. Plato's first *Alcibiades*), (5) the Stoic doctrine of liberty (introduced by generous allusions to Cornutus' teaching), and (6) the proper use of money. The *Life* tells us that the *Satires* were not left complete; some lines were taken (presumably by Cornutus or Bassus) from the end of the work so that it might be *quasi finitus*. This perhaps means that a sentence in which Persius had left a line imperfect, or a paragraph which he had not completed, had to be omitted. The same authority says that Cornutus definitely blacked out an offensive allusion to the emperor's literary taste, and that we owe to him the reading of the MSS. in *Sat.* i. 121, —"auriculas asini *quis non* [for *Mida rex*] habet!" Traces of lack of revision are, however, still visible; cf. *e.g.* v. 176 (sudden transition from ambition to superstition) and vi. 37 (where criticism of Greek *doctores* has nothing to do with the context). The parallels to passages of Horace and Seneca are recorded in the commentaries: in view of what the *Life* says about Lucan, the verbal resemblance of *Sat.* iii. 3 to *Phars.* x. 163 is interesting. Examples of bold language or metaphor: i. 25, *rupto iecore exierit caprificus*, 60, *linguae quantum sitiat canis*; iii. 42, *intus palleat*, 81, *silentia rodunt*; v. 92, *ueteres auiae de pulmone reuello*. Passages like iii. 87, 100 sqq. show elaboration carried beyond the rules of good taste. "Popular" words: *baro*, *cëdo*, *ebullire*, *gluto*, *lallare*, *mamma*, *muttire*, *obba*, *palpo*, *stloppus*. Fine lines, &c., in i. 116 sqq., ii. 6 sqq., 61 sqq., 73 sqq., iii. 39 sqq.

Authorities.—The MSS. of Persius fall into two groups, the one represented by two of the best of them, the other by that of Pithoeus, so important for the text of Juvenal. Since the publication of J. Bieger's *de Persii cod. pith. recte aestimando* (Berlin, 1890) the tendency has been to prefer the tradition of the latter.

The important editions are: (1) with explanatory notes: Casaubon (Paris, 1605, enlarged edition by Dübner, Leipzig, 1833); O. Jahn (with the scholia and valuable prolegomena, Leipzig, 1843); Conington (with translation; 3rd ed., Oxford, 1893); B. L. Gildersleeve (New York, 1875); G. Némethy (Buda-Pesth, 1903); (2) with critical notes: Jahn-Bucheler (3rd ed., Berlin, 1893); S. G. Owen (with Juvenal, Oxford, 1902). Translations into English by Dryden (1693); Conington (*loc. cit.*) and Hemphill (Dublin, 1901). Criticism, &c., in Martha, *Les Moralistes sous l'empire romain* (5th ed., Paris, 1886); Nisard, *Poètes latins de la décadence* (Paris, 1834); Hirzel, *Der Dialog* (Leipzig, 1895); Saintsbury, *History of Criticism*, i. 248; Henderson, *Life and Principate of the Emperor Nero* (London, 1903); and the histories of Roman literature (especially Schanz, §§ 382 sqq.). A *Bibliography of Persius*, by M. H. Morgan (Cambridge, U.S.A., 1893). (W. C. Su.)

PERSON, OFFENCES AGAINST THE. This expression is used in English law to classify crimes involving some form of assault or personal violence or physical injury, *i.e.* offences affecting the life, liberty or safety of an individual: but it is also extended to certain offences against morality which cannot technically be described as assaults. The bulk of the offences thus classified, so far as their definition or punishment depends upon statute law, are included in the Offences Against the Person Act 1861 (24 & 25 Vict. c. 100), and in the Criminal Law Amendment Acts of 1880 and 1885, and the Prevention of Cruelty to Children Act 1904. The classification in these statutes is not scientific: *e.g.* bigamy is within the act of 1861 (s. 57), and certain offences involving assault, *e.g.* robbery, are to be found in other statutes. The particular offences dealt with by the acts above named are discussed under their appropriate titles, *e.g.* abortion, assault, bigamy, homicide, rape, &c. In the Indian penal code most of the offences above referred to fall under the head "offences against the human body" (ch. xvi.). In his *Digest of the Criminal Law* Sir James Stephen includes most of these offences under the title "offences against the person, the conjugal and parental rights, and the reputation of individuals," a classification also to be found in the English draft code of 1880 and adopted in the Queensland code of 1899. In working out this classification offences not involving assault are relegated to another and perhaps more appropriate title, "offences against morality."

PERSONALITY (from Lat. *persona*, originally an actor's mask, from *personare*,[1] to sound through), a term applied in philosophy and also in common speech to the identity or individuality which makes a being (person) what he is, or marks him off for all that he is not. The term "person," which is technically used not only in philosophy but also in law, is applied in theology (Gr. πρόσωπον) to the three hypostases of the Trinity. It was first introduced by Tertullian, who implied by it a single individual; the Father, the Son and the Holy Ghost were three *personae* though of one and the same substance (*unitas substantiae*). The nature of this unity in difference exercised the minds of the early Christian theologians, and was the subject of many councils and official pronouncements, according as emphasis was laid on the unity or on the separateness of the persons. There was perpetual schism between the Unitarians and Trinitarians (see, for example, Sabellius). The natural sense of the word "person" is undoubtedly individuality; hence those who found a difficulty in the philosophic conception of the three-in-one naturally tended to lay emphasis on the distinctions between the members of the Trinity (see Heresy; Monarchianism; Logos, &c.). A further theological question arises in connexion with the doctrine of immortality (*q.v.*), and it is argued that immortality is meaningless unless the soul of the dead man is self-conscious throughout.

In philosophy the term has an important ethical significance. The Greek moralists, attaching little importance to individual citizens as such, found the highest moral perfection in the subordination of the individual to the state. Man, as πολιτικὸν ζῷον, is good only when he is a good πολίτης. Subsequent ethical systems on the contrary have laid stress on the moral worth of personality, finding the *summum bonum* in the highest realization of the self. This view is specially characteristic of the Neo-hegelian school (*e.g.* T. H. Green), but it belongs also in various degrees to all intuitional and idealistic systems. Utilitarian universalistic hedonism and evolutionist ethics so far resemble the Greek theory that they tend to minimize the importance of personality, by introducing ulterior reasons (*e.g.* the perfection of the social organism, of humanity) as the ultimate sanctions of moral principles, whereas the intuitionists by making the criterion abstract and absolute limit goodness to *personal* obedience to the a priori moral law.

Still more important problems are connected with the psychological significance of personality. What is the origin and character of the consciousness of the self? The consciousness of the identity of another person is comparatively simple; but one's own individuality consists partly in being aware of that individuality; a man cannot use the word "I" unless he is conscious of the unity of his "self," and yet there is involved in the word "I" something more than this consciousness. In what does the unity of the "self" consist prior to its being recognized in consciousness; how does the consciousness arise? The answer to this problem is to be found—in so far as it can be found—in the subject-object relation, in the distinction between the external world and the subjective processes of knowing and willing which that relation involves. I will something, and afterwards perceive a corresponding change within the unity of my external world. Hence, we may suppose, arises the consciousness of a permanent self and not-self.

It should be observed that self-consciousness varies according to the intellectual development, and the term "personality" is usually connected only with the self-consciousness of an advanced type, not, for example, with that of an animal. Even among human beings there is considerable difference. The most elementary form of human self-consciousness includes in the self not only the soul but also the body, while to the developed self-consciousness the physical self is part of the external or objective world. Finally it is necessary to refer to the Kantian distinction of the pure and the empirical ego, the latter ("the Me known") being an object of thought to the former ("the I knowing").

From the use of the term "person" as distinguishing the

[1] So Gabius Bassus in Gell. *Noct. Att.* v. 7, 1. Since, however, it is difficult to explain *persōna* from *persŏnare* (Skeat suggests by analogy from πρόσωπον, the Greek equivalent!), Walde, in *Lateinisches etymologisches Wörterbuch* (1906), suggests a derivation from Greek ζώνη, a zone. In Roman law *persona* was one who had civil rights. For the ecclesiastical *persona ecclesiae*, see Parson.

self from the not-self arises the phrase "personal equation" for those peculiar characteristics or idiosyncrasies which have to be taken into account in estimating the value of an individual judgment or observation. This phrase, which is commonly used in any connexion, was first applied to the errors detected in the astronomical observations of a Greenwich observer named Kinnebrook in 1795. The recognized fact that the greater or less inaccuracy is habitual to individual observers has been investigated, *e.g.* by Bessel (*Abhandlungen*, iii. 300) and by Wundt (*Physiol. Psychol.*), and machines have been devised which make allowance for the error caused by the personal equation (see MICROMETER).

For the psychological problem, see PSYCHOLOGY. For the problems connected with sub-conscious action, &c., see SUBLIMINAL SELF; TRANCE; HYPNOTISM; TELEPATHY.

PERSONAL PROPERTY, one branch of the main division of the English law of property, the other being "real property." The division of property into real and personal represents in a great measure the division into immovable and movable incidentally recognized in Roman law and generally adopted since. "Things personal," according to Blackstone, "are goods, money, and all other movables which may attend the owner's person wherever he thinks proper to go" (*Comm.* ii. 16). This identification of things personal with movables, though logical in theory, does not, as will be seen, perfectly express the English law, owing to the somewhat anomalous position of chattels real. In England real property is supposed to be superior in dignity to personal property, which was originally of little importance from a legal point of view. This view is the result of feudal ideas, and had no place in the Roman system, in which immovables and movables were dealt with as far as possible in the same manner, and descended according to the same rules. The main differences between real and personal property which still exist in England are these. (1) In real property there can be nothing more than limited ownership; there can be no estate properly so called in personal property, and it may be held in complete ownership. There is nothing corresponding to an estate-tail in personal property; words which in real property would create an estate-tail will give an absolute interest in personalty. A life-interest may, however, be given in personalty, except in articles *quae ipso usu consumuntur*. Limitations of personal property, equally with those of real property, fall within the rule against perpetuities. (2) Personal property is not subject to various incidents of real property, such as rent, dower or escheat. (3) On the death of the owner intestate real property descends to the heir; personal property is divided according to the Statute of Distributions. (4) Real property as a general rule must be transferred by deed; personal property does not need so solemn a mode of transfer. (5) Contracts relating to real property must be in writing by the Statute of Frauds, 29 Car. II. c. 3, s. 4; contracts relating to personal property need only be in writing when it is expressly so provided by statute, as, for instance, in the cases falling under s. 17 of the Statute of Frauds. (6) A will of lands need not be proved, but a will of personalty or of personal and real property together must be proved in order to give a title to those claiming under it. (7) Devises of real estate fall as a rule within the Mortmain Acts (see CHARITY AND CHARITIES; CORPORATION); bequests of personal property, other than chattels real, are not within the act. (8) Mortgages of real property need not generally be registered; mortgages of personal property for the most part require registration under the Bills of Sale Acts (see PLEDGE, and BILL OF SALE).

Personal estate is divided in English law into *chattels real* and *chattels personal*; the latter are again divided into *choses in possession* and *choses in action* (see CHATTEL; CHOSE).

Interest in personal property may be either absolute or qualified. The latter case is illustrated by animals *ferae naturae*, in which property is only coextensive with detention. Personal property may be acquired by occupancy (including the *accessio, commixtio,* and *confusio* of Roman law), by invention, as patent and copyright, or by transfer, either by the act of the law (as in bankruptcy, judgment and intestacy), or by the act of the party (as in gift, contract and will).

There are several cases in which, by statute or otherwise, property is taken out of the class of real or personal to which it seems naturally to belong. By the operation of the equitable doctrine of conversion money directed to be employed in the purchase of land, or land directed to be turned into money, is in general regarded as that species of property into which it is directed to be converted. An example of property prima facie real which is treated as personal is an estate *pur autre vie*, which, since 14 Geo. II. c. 20, s. 9, 1740–1741 (now replaced by the Wills Act 1837, s. 6), is distributable as personal property in the absence of a special occupant. Examples of property prima facie personal which is treated as real are fixtures, heirlooms, such as deeds and family portraits, and shares in some of the older companies, as the New River Company, which are real estate by statute. In ordinary cases shares in companies are personal property, unless the shareholders have individually some interest in the land as land.

The terms *heritable* and *movable* of Scots law to a great extent correspond with the real and personal of English law. The main points of difference are these. (1) Leases are heritable as to the succession to the lessee, unless the destination expressly exclude heirs, but are movable as to the fisk. (2) Money due on mortgages and securities on land is personalty in England. At common law in Scotland debts secured on heritable property are themselves heritable. But by the Titles to Land Consolidation (Scotland) Act 1868, s. 117, heritable securities are movable as far as regards the succession of the creditor, unless executors are expressly excluded. They still, however, remain heritable *quoad fiscum*, as between husband and wife, in computing legitim, and as far as regards the succession of the debtor. (3) Up to 1868 the heir of heritage succeeded to certain movable goods called heirship movables, which bore a strong likeness to the heirlooms of English law. This right of the heir was abolished by the act of 1868, s. 160. (4) Annuities, as having *tractum futuri temporis*, are heritable, and an obligation to pay them falls upon the heir of the deceased (Watson, *Law Dict. s.v.* "Annuities").

The law in the United States agrees in most respects with that of England. Heirlooms are unknown, one reason being, no doubt, that the importance of title-deeds is much less than it is in England, owing to the operation of the Registration Acts. Long terms in some states have annexed to them the properties of freehold estates. In some states estates *pur autre vie* descend like real property; in others an estate *pur autre vie* is deemed a freehold only during the life of the grantee; after his death it becomes a chattel real. In yet other states the heir has a *scintilla* of interest as special occupant (Kent, *Comm.* iv. 27). In some states railway rolling-stock is considered as purely personal, in others it has been held to be a fixture, and so to partake of the nature of real property. Shares in some of the early American corporations were, like New River shares in England, made real estate by statute, as in the case of the Cape Sable Company in Maryland (Schouler, *Law of Personal Property*, i.). In Louisiana animals employed in husbandry are, and slaves were, regarded as immovables. Pews in churches are generally real property, but in some states they are made personal property by statute. The assignment of choses in action is generally permitted, and is in most states regulated by statute. (J. W.)

PERSONATION, in English law, a form of fraud consisting in a false representation by one person (by words or conduct) that he is another person living or dead. It is not an offence by the common law unless the representation is made on oath under circumstances constituting the offence of perjury, or unless the representation if not made on oath is made under circumstances amounting to a common law cheat. Personation has been made an offence by statute in the following cases: (1) where it amounts to a false pretence by words or conduct, and is done with intent to defraud, and property is by such false pretence obtained, 24 & 25 Vict. c. 96, ss. 88–90 (see FALSE PRETENCES); (2) in the case of false and deceitful personation of any person or of the heir, executor, administrator, wife, widow, next of kin or relative of any person with intent fraudulently to obtain any land, estate, chattel, money, valuable security or property (37 & 38 Vict. c. 36, s. 1); (3) in the case of personation of votes at elections (see CORRUPT PRACTICES).

The first of these offences is a misdemeanour only; the second is a felony punishable by penal servitude for life. The second offence was created in 1874 in consequence of the Tichborne case, in which under the law as it then stood it had been necessary

to prosecute the claimant for perjury. Besides the enactments above referred to there are also a number of provisions for dealing with the personation of sailors, soldiers, pensioners, and owners of stock in the public funds or shares in joint-stock companies, and of persons who falsely acknowledge in the name of another recognizances, deeds or instruments, before a court or person authorized to take the acknowledgment.

PERSPECTIVE (Lat. *perspicere*, to see through), in mathematics, the name given to the art of representing solid objects by a plane drawing which affects the eye as does the object itself. In the article PROJECTION it is shown that if all points in a figure be projected from a fixed centre to a plane, each point on the projection will be the projection of all points on the projecting ray. A complete representation by a single projection is therefore possible only when there is but one point to be projected on each ray. This is the case by projecting from one plane to another, but it is also the case if we project the *visible* parts of objects in nature; for every ray of light meeting the eye starts from that point in which the ray, if we follow its course from the eye backward, meets for the first time any object. Thus, if we project from a fixed centre the *visible* part of objects to a plane or other surface, then the outlines of the projection would give the same impression to the eye as the outlines of the things projected, provided that one eye only be used and that this be at the centre of projection. If at the same time the light emanating from the different points in the picture could be made to be of the same kind—that is, of the same colour and int nsity and of the same kind of polarization—as that coming from the objects themselves, then the projection would give sensibly the same impression as the objects themselves. The art of obtaining this result constitutes a chief part of the technique of a painter, who includes the rules which guide him under the name of perspective, distinguishing between *linear* and *aerial* perspective—the former relating to the projection, to the *drawing* of the outlines, the latter to the colouring and the shading off of the colours in order to give the appearance of distance. Here we deal only with the former, which is in fact a branch of geometry consisting in the applications of the rules of projection.

§ 1. Our problem is the following: *There is given a figure in space, the plane of a picture, and a point as centre of projection; it is required to project the figure from the point to the plane.*

From what has been stated about projection (*q.v.*) in general it follows at once that the projection of a point is a point, that of a line a line. Further, the projection of a point at infinity in a line is in general a finite point. Hence parallel lines are projected into a pencil of lines meeting at some finite point. This point is called the *vanishing point of the direction* to which it belongs. To find it, we project the point at infinity in one of the parallel lines; that is, we draw through the eye a line in the given direction. This cuts the picture plane in the point required.

Similarly all points at infinity in a plane are projected to a line (see PROJECTION: § 6) which is called the *vanishing line of the plane* and which is *common to all parallel planes.*

All lines parallel to a plane have their vanishing points in a line, viz. in the vanishing line of the plane.

All lines parallel to the picture plane have their vanishing points at infinity in the picture plane; hence *parallel lines which are parallel to the picture plane appear in the projection as parallel lines in their true direction.*

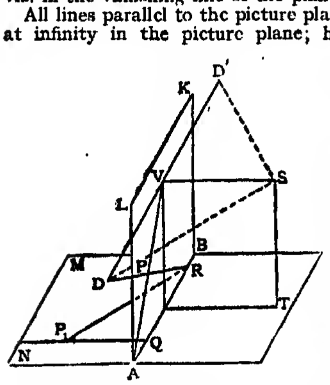

FIG. 1.

The projection of a line is determined by the projection of two points in it, these being very often its vanishing point and its trace on the picture plane. *The projection of a point is determined by the projection of two lines through it.*

These are the general rules which we now apply. We suppose the picture plane to be vertical.

§ 2. Let (fig. 1) S be the centre of projection, where the eye is situated, and which in perspective is called the *point of sight*, ABKL the picture plane, ABMN a horizontal plane on which we suppose the objects to rest of which a perspective drawing is to be made. The lowest plane which contains points that are to appear in the picture is generally selected for this purpose, and is therefore called the ground plane, or sometimes the geometrical plane. It cuts the picture plane in a horizontal line AB called the ground line or base line or fundamental line of the picture. A horizontal line SV, drawn through the eye S perpendicular to the picture, cuts the latter at a point V called the centre of the picture or the centre of vision. The distance SV of the eye from the picture is often called the distance simply, and the height ST of the eye above the ground the height of the eye.

The vanishing line of the ground plane, and hence of every horizontal plane, is got by drawing the projecting rays from S to the points at infinity in the plane—in other words, by drawing all horizontal rays through S. These lie in a horizontal plane which cuts the picture plane in a horizontal line DD' through the centre of vision V. This line is called the horizon in the picture. It contains the vanishing points of all horizontal lines, the centre of vision V being the vanishing point of all lines parallel to SV, that is perpendicular to the picture plane. To find the vanishing point of any other line we draw through S the ray projecting the point at infinity in the line; that is, we draw through S a ray parallel to the line, and determine the point where this ray cuts the picture plane. If the line is given by its plan on the ground plane, and its elevation on the picture plane, then its vanishing point can at once be determined; it is the vertical trace of a line parallel to it through the eye (cf. GEOMETRY: § *Descriptive*, § 6).

§ 3. To have construction in a single plane, we suppose the picture plane turned down into the ground plane; but before this is done the ground plane is pulled forward till, say, the line MN takes the place of AB, and then the picture plane is turned down. By this we keep the plan of the figure and the picture itself separate. In this new position the plane of the picture will be that of the paper (fig. 2). On it are marked the base line AB, the centre of vision V, and the horizon DD', and also the limits ABKL of the actual picture. These, however, need not necessarily be marked. In the plan the picture plane must be supposed to pass through A_1B_1, and to be perpendicular to the ground plane. If we further suppose that the horizontal plane through the eye which cuts the picture plane in the horizon DD' be turned down about the horizon, then the centre of sight will come to the point S, where VS equals the distance of the eye.

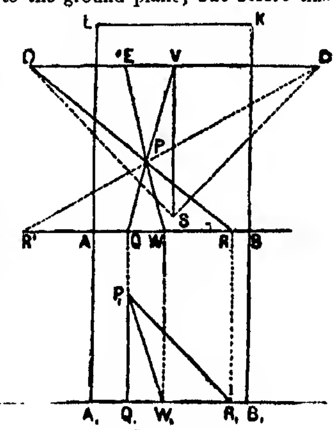

FIG. 2.

To find the vanishing point of any line in a horizontal plane, we have to draw through S a line in the given direction and see where it cuts the horizon. For instance to find the vanishing points of the two horizontal directions which make angles of 45° with the horizon, we draw through S lines SD and SD' making each an angle of 45° with the line DD'. These points can also be found by making VD and VD' each equal to the distance SV. The two points D, D' are therefore called the distance points.

§ 4. Let it now be required to find the perspective P of a point P_1 (figs. 1 and 2) in the ground plane. We draw through P_1 two lines of which the projection can easily be found. The most convenient lines are the perpendicular to the base line, and a line making an angle of 45° with the picture plane. These lines in the ground plane are P_1Q_1 and P_1R_1. The first cuts the picture at Q_1 or at Q, and has the vanishing point V; hence QV is its perspective. The other cuts the picture in R_1, or rather in R, and has the vanishing point D; its perspective is RD. These two lines meet at P, which is the point required. It will be noticed that the line $QR = Q_1R_1 = Q_1P_1$ gives the distance of the point P behind the picture plane. Hence if we know the point Q where a perpendicular from a point to the picture plane cuts the latter, and also the distance of the point behind the picture plane, we can find its perspective. We join Q to V, set off QR to the right equal to the distance of the point behind the picture plane, and join R to the distance point to the left; where RD cuts QV is the point P required. Or we set off QR' to the left equal to the distance and join R' to the distance point D' to the right.

If the distance of the point from the picture should be very great, the point R might fall at too great a distance from Q to be on the drawing. In this case we might set off QW equal to the *n*th part of the distance and join it to a point E, so that VE equals the *n*th part of VD. Thus if $QW = \frac{1}{4}QR$ and $VE = \frac{1}{4}VD$, then WE will again pass through P. It is thus possible to find for every point in the ground plane, or in fact in any horizontal plane, the perspective,

for the construction will not be altered if the ground plane be replaced by any other horizontal plane. We can in fact now *find the perspective of every point as soon as we know the foot of the perpendicular drawn from it to the picture plane, that is, if we know its elevation on the picture plane, and its distance behind it.* For this reason it is often convenient to draw in slight outlines the elevation of the figure on the picture plane.

Instead of drawing the elevation of the figure we may also proceed as follows. Suppose (fig. 3) A_1 to be the projection of the plan of a point A. Then the point A lies vertically above A_1 because *vertical lines appear in the perspective as vertical lines* (§ 1). If then the line VA_1 cuts the figure plane at Q, and we erect at Q a perpendicular in the picture plane to its base and set off on it QA_2 equal to the real height of the point A above the ground plane,

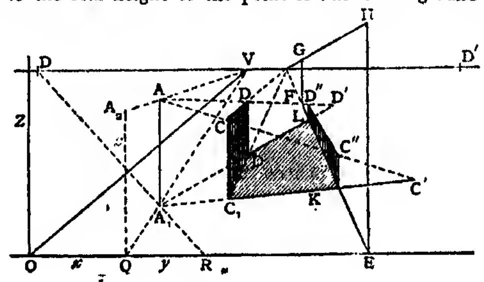

Fig. 3.

then the point A_2 is the elevation of A and hence the line A_2V will pass through the point A. The latter thus is determined by the intersection of the vertical line through A_1 and the line A_2V.

This process differs from the one mentioned before in this that the construction for finding the point is not made in the horizontal plane in which it lies, but that its plan is constructed in the ground plane. But this has a great advantage. The perspective of a horizontal plane from the picture to the line at infinity occupies in the picture the space between the line where the plane cuts the picture and the horizon, and this space is the greater the farther the plane is from the eye, that is, the farther its trace on the picture plane lies from the horizon. The horizontal plane through the eye is projected into a line, the horizon; hence no construction can be performed in it. The ground plane, on the other hand, is the lowest horizontal plane used. Hence it offers most space for constructions, which consequently will allow of greater accuracy.

§ 5. The process is the same if we know the co-ordinates of the point, viz. we take in the base line a point O as origin, and we take the base line, the line OV, and the perpendicular OZ as axes of co-ordinates. If we then know the co-ordinates x, y, z measured in these directions, we make $OQ = x$, set off on QV a distance QA such that its real length $QR = y$, make $QA_2 = z$, and we find A as before. This process might be simplified by setting off to begin with along OQ and OZ scales in their true dimensions and along OV a scale obtained by projecting the scale on OQ from D to the line OV.

§ 6. The methods explained give the perspective of any point in space. If lines have to be found, we may determine the perspective of two points in them and join these, and this is in many cases the most convenient process. Often, however, it will be advantageous to determine the projection of a line directly by finding its vanishing point. This is especially to be recommended when a number of parallel lines have to be drawn.

The perspective of any curve is in general a curve. The projection of a conic is a conic, or in special cases a line. The perspective of a circle may be any conic, not necessarily an ellipse. Similarly the perspective of the shadow of a circle on a plane is some conic.

§ 7. A few words must be said about the determination of shadows in perspective. The theory of their construction is very simple. We have given, say, a figure and a point L as source of light. We join the point L to any point of which we want to find the shadow and produce this line till it cuts the surface on which the shadow falls. These constructions must in many cases first be performed in plan and elevation, and then the point in the shadow has to be found in perspective. The constructions are different according as we take as the source of light a finite point (say, the flame of a lamp), or the sun, which we may suppose to be at an infinite distance.

If, for instance, in fig. 3, A is a source of light, EHGF a vertical wall, and C a point whose shadow has to be determined, then the shadow must lie on the line joining A to C. To see where this ray meets the floor we draw through the source of light and the point C a vertical plane. This will cut the floor in a line which contains the feet A_1, C_1 of the perpendiculars drawn from the points A, C to the floor, or the plans of these points. At C', where the line A_1C_1 cuts AC, will be the shadow of C on the floor. If the wall EHGF prevents the shadow from falling on the floor, we determine the intersection K of the line A_1C_1 with the base EF of the wall and draw a vertical through it, this gives the intersection of the wall with the vertical plane through A and C. Where it cuts AC is the shadow C'' of C on the wall

If the shadow of a screen CDD_1C_1 has to be found we find the shadow D' of D which falls on the floor; then D_1D' is the shadow of D_1D and D'C' is the shadow on the floor of the line DC. The shadow of D_1D, however, is intercepted by the wall at L. Here then the wall takes up the shadow, which must extend to D'' as the shadow of a line on a plane is a line. Thus the shadow of the screen is found in the shaded part in the figure.

§ 8. If the shadows are due to the sun, we have to find first the perspective of the sun, that is, the vanishing point of its rays. This will always be a point in the picture plane; but we have to distinguish between the cases where the sun is in the front of the picture, and so behind the spectator, or behind the picture plane, and so in front of the spectator. In the second case only does the vanishing point of the rays of the sun actually represent the sun itself. It will be a point above the horizon. In the other case the vanishing point of the rays will lie below the horizon. It is the point where a ray of the sun through the centre of sight S cuts the picture plane, or it will be the shadow of the eye on the picture. In either case the ray of the sun through any point is the line joining the perspective of that point to the vanishing point of the sun's rays. But in the one case the shadow falls away from the vanishing point, in the other it falls towards it. The direction of the sun's rays may be given by the plan and elevation of one ray.

For the construction of the shadow of points it is convenient first to draw a perpendicular from the point to the ground and to find its shadow on the ground. But the shadows of verticals from a point at infinity will be parallel; hence they have in perspective a vanishing point L_1 in the horizon. To find this point, we draw that vertical plane through the eye which contains a ray of the sun. This cuts the horizon in the required point L_1 and the picture plane in a vertical line which contains the vanishing point of the sun's rays themselves. Let then (fig. 4) L be the vanishing point

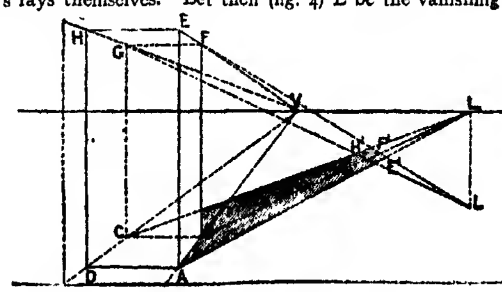

Fig. 4.

of the sun's rays, L_1 be that of their projection in a horizontal plane, and let it be required to find the shadow of the vertical column AH. We draw AL_1 and EL; they meet at E', which is the shadow of E. Similarly we find the shadows of F, G, H. Then E'F'G'H' will be the shadow of the quadrilateral EFGH. For the shadow of the column itself we join E' to A, &c., but only mark the outlines; F'B, the shadow of BF, does not appear as such in the figure.

If the shadow E has to be found when falling on any other surface we use the vertical plane through E, determine its intersection with the surface, and find the point where this intersection is cut by the line EL. This will be the required shadow of E.

§ 9. If the picture is not to be drawn on a vertical but on another plane—say, the ceiling of a room—the rules given have to be slightly modified. The general principles will remain true. But if the picture is to be on a curved surface the constructions become somewhat more complicated. In the most general case conceivable it would be necessary to have a representation in plan and elevation of the figure required and of the surface on which the projection has to be made. A number of points might also be found by calculation, using co-ordinate geometry. But into this we do not enter. As an example we take the case of a panorama, where the surface is a vertical cylinder of revolution, the eye being in the axis. The ray projecting a point A cuts the cylinder in two points on opposite sides of the eye, hence geometrically speaking every point has two projections; of these only the one lying on the half ray from the eye to the point can be used in the picture. But the other has sometimes to be used in constructions, as the projection of a line has to pass through both. Parallel lines have two vanishing points which are found by drawing a line of the given direction through the eye; it cuts the cylinder in the vanishing points required. This operation may be performed by drawing on the ground the plan of the ray through the foot of the axis, and through the point where it cuts the cylinder a vertical, on which the point required must lie. Its height above is easily found by making a drawing of a vertical section on a reduced scale.

Parallel planes have in the same manner a vanishing curve. This will be for horizontal planes a horizontal circle of the height of the eye above the ground. For vertical planes it will be a pair of generators of the cylinder. For other planes the vanishing curves will be ellipses having their centre at the eye.

The projections of vertical lines will be vertical lines on the

cylinder. Of all other lines they will be ellipses with the centre at the eye. If the cylinder be developed into a plane, then these ellipses will be changed into curves of sines. Parallel lines are thus represented by curves of sines which have two points in common. There is no difficulty in making all the constructions on a small scale on the drawing board and then transferring them to the cylinder.

§ 10. A variety of instruments have been proposed to facilitate perspective drawings. If the problem is to make a drawing from nature then a camera obscura or, better, Wollaston's camera lucida may be used. Other instruments are made for the construction of perspective drawings. It will often happen that the vanishing point of some direction which would be very useful in the construction falls at a great distance off the paper, and various methods have been proposed of drawing lines through such a point. For some of these see Stanley's *Descriptive Treatise on Mathematical Drawing Instruments.* (O. H.)

PERSPIRATION (Lat. *per*, through, and *spirare*, to breathe), the excretion of sweat from the sweat-glands of the skin. Sweat is a clear colourless neutral or slightly alkaline fluid containing 2 % of solids. Under pathological conditions, sugar urea and other substances are found. The secretion of sweat is constantly going on, the activity of the sweat-glands being under control of the central nervous system. The only function of sweat is the regulation of the heat discharge from the body. The chief morbid conditions of the sweat-glands are excessive sweating (*Hyperidrosis*) and foetid sweating (*Bromidrosis*). Excessive sweating is a symptom observed in various diseases, such as tuberculosis and rheumatic fever, but it may exist apart from such conditions, and either be general, affecting the whole body, or confined to a part, such as the axillae, head, hands, feet, or, as in some rare instances, the one half of the body. Excessive perspiration may often be prevented by the cold bath, and by tonics, such as iron, quinine, strychnia, &c. Locally, the use of astringent lotions of vinegar or a weak solution of lead will also be of service. Foetid sweating most frequently affects the feet, specially in those who have much fatigue, and is apparently due to rapid decomposition in the perspiration which has saturated the stockings; these should be frequently changed and the feet washed several times a day, dried carefully, and dusted with some antiseptic powder.

PERTAB (or Partab) **SINGH,** Sir, maharaja of Idar (1884–), native Indian soldier and statesman, belonging to the Rahtor Rajputs of the Jodha class, was born in 1844, being the son of Maharaja Takht Singh, ruler of Marwar (or Jodhpur). In 1878 and again in 1879 he was chief minister of Jodhpur. In the following year he accompanied the British mission to Afghanistan, and on his return he carried out many judicious reforms and administered Jodhpur with remarkable success. He visited England to take part in the celebration of the 1887 Jubilee of Queen Victoria's reign. He served on the staffs of Sir William Lockhart and General Elles in the Tirah and Momand expeditions in 1897–98, was slightly wounded, was mentioned in despatches, and promoted to the rank of full colonel. He won the reputation of being one of the keenest sportsmen and the best riders that even Rajputana has produced. When it was decided to send a force from India to China in 1900 to relieve the foreign embassies besieged in Peking, Sir Pertab Singh at once offered the services of the Jodhpur Lancers, and himself accompanied them. His father rendered good services to the British government in the Mutiny, and Pertab Singh always cherished the memory of the protection given to Jodhpur by the East India Company in 1818. His services to the empire in India were universally recognized. From Queen Victoria he received the honour of knighthood and the Bath and the Star of India; from King Edward VII. the distinction of "aide-de-camp"; and the university of Cambridge gave him the degree of LL.D. From his own state of Jodhpur he obtained the title of Maharaja-Dhiraj. In 1901 he succeeded to the rulership of the state of Idar.

PERTH, EARLS AND DUKES OF. The Scottish title of earl of Perth was bestowed upon James, 4th Lord Drummond (d. 1611) in 1605. His ancestor Sir John Drummond (d. 1519) had been created Lord Drummond in 1488. The 1st earl's great-nephew, James, 4th earl and 1st duke of Perth (1648–1716), was a son of James, the 3rd earl (*c.* 1615–1675). When John Maitland, duke of Lauderdale, was virtually the dictator of Scotland, Perth was among his opponents, and after Lauderdale's retirement in 1680 he was one of the committee of seven which managed Scottish affairs. He was made justice-general and extraordinary lord of session in 1682, and was lord chancellor of Scotland from 1684 to 1688. As a convert to Roman Catholicism after the death of Charles II., he stood high in the favour of James II. Perth, who is credited with the introduction of the thumbscrew, was very unpopular with the Scottish people, and during the Revolution of 1688 he was imprisoned at Stirling. Released from captivity in 1693 he joined James II. at St Germains, and was made duke of Perth, a titular dignity only, after the exiled king's death in 1701. His son James (*c.* 1675–1720) was with James II. in Ireland, and led the cavalry at the battle of Sheriffmuir. He was attainted in 1715, but claimed the dukedom of Perth after his father's death. His son James (1713–1746), regarded by friends and dependants as the 3rd duke of Perth, fought for the Young Pretender at Prestonpans and Culloden. His brother and heir, John, the 4th duke (*c.* 1716–1747), also joined Charles Edward, and fought at Falkirk and Culloden. The titular dukedom became extinct when the sixth holder, Edward, another son of the 1st duke, died in 1760.

The earldom was then claimed by Edward's cousin, James Lundin (1707–1781), a grandson of the 1st titular duke of Melfort, who was a brother of the 1st duke of Perth and took the name of Drummond. His son James (1744–1800) secured the Drummond estates in 1783, and was created a British peer as Lord Perth and Baron Drummond in 1797. On his death without sons in July 1800 his barony became extinct, but the claim to the earldom of Perth was inherited by his kinsman, the 4th titular duke of Melfort, and his descendants (see below). The Drummond estates, however, passed to the baron's daughter Clementina (d. 1865), afterwards the wife of Peter Robert, 20th Lord Willoughby de Eresby, and thence to her descendant the earl of Ancaster.

The 1st duke's brother, John (*c.* 1650–1715), earl of Melfort, rose to favour under Charles II. about the same time as his brother; like him, too, he became a Roman Catholic in 1686. In 1684 he was made secretary of state for Scotland; in 1686 he was created earl of Melfort by James II., and during his reign he took a leading part in Scottish affairs. After the Revolution of 1688 his great influence with James II. and with Mary of Modena drew upon him the hatred both of the French and of the Irish. He was with James II. at St Germains, but lost his former ascendancy, and died in Paris on the 25th of January 1715. In 1694 he was made duke of Melfort, and all his titles were held under the singular condition that they should descend to the children of his second wife, Euphemia (d. 1743), daughter of Sir Thomas Wallace, in preference to his children by his first wife, Sophia Lundin, who were Protestants. In 1701 Melfort was recognized as a French peer, the duc de Melfort, by Louis XIV. In 1695 he had been attainted, but his titles were claimed by John (1682–1754), his eldest son by his second wife, who shared in the rising of 1715. In 1800 John's grandson, James Louis, 4th titular duke of Melfort, claimed the earldom of Perth. This claim was unsuccessful, but in 1853 George (1807–1902), nominally 6th duke of Melfort, obtained a reversal of the various attainders, and his own recognition as earl of Perth and Melfort. The succeeding earl was his kinsman, William Huntly Drummond, Viscount Strathallan (1871–).

See Sir R. Douglas, *The Peerage of Scotland*; and *Histories of Noble British Families*, vol. ii., edited by H. Drummond (1846).

PERTH, the capital of Western Australia, situated on the Swan River, 12 m. by rail from the sea at Fremantle, and about 1700 m. W.N.W. of Melbourne. It is the seat of both Anglican and Roman Catholic bishops, and has two cathedrals. The fashionable street is St George's Terrace; in it are situated the public library, the government boys' school, the stock exchange, the town hall, the government offices and the parliament buildings. Between it and the broad reach of the river known as Perth Water lie the governor's residence and domain. The

town hall, built entirely by convict labour, stands on an eminence in the very heart of the city; opposite to it are the government offices, housed in a four-storeyed structure in the style of the French Renaissance. The mint, opened in 1899, is a massive freestone building. There are a public library, built as a memorial of Queen Victoria's Jubilee in 1887, a Scots college, two good theatres, a mechanics' institute, a museum, and a fine Wesleyan church-house, known as Queen's Hall. The Perth Park, containing about 1200 acres, is connected by tram with the city, and in it is a well-equipped observatory. There are several smaller parks and squares in the city, while the esplanade gardens are a feature of the place, being thrown out like a pier into Perth Water. There is a good cricket ground, and three race-courses are in easy reach. South Perth, on the other side of the river, is connected by bridges and steam ferry; and adjoining the city on the north-west are the suburban municipalities of Leederville and Subiaco. Outlying suburbs are Belmont, Victoria Park, Burswood, Claremont, Cottesloe, Peppermint Grove and Bayswater. The city is lighted by electricity, and has a good service of electric trams. Perth has an agreeable climate, the mean temperature is 64·9° F., and the average rainfall 33 in. Perth was founded in 1829, received its municipal charter in 1856, and was created a city in 1880. Between 1891 and 1901 the growth of the city was remarkably rapid; in 1891 the population was only 8447, but in 1901 it had grown to 27,471 in the city proper, and to 36,199 including the suburbs.

PERTH, a city, and royal, municipal and police burgh, and county town of Perthshire, Scotland, 32 m. N. by W. of Edinburgh direct, and 47¾ m. by the North British railway, via the Forth Bridge and Kinross Junction. Pop. (1901), 33,566. It is situated on the right bank of the Tay, between the meadows of the North Inch (98 acres) and those of the South Inch (72 acres), both laid out as public parks. The river is crossed by St John's Bridge of nine arches, completed in 1772 from the designs of John Smeaton and widened a century later; by Victoria Bridge, a modern structure connecting South Street with Dundee Road; and farther south (at the end of Tay Street) by a footway alongside of the viaduct belonging to the Caledonian railway. Of earlier bridges one, which crossed at High Street, was swept away by the flood of 1621, and another, constructed by General Wade in 1723-1733, was apparently the predecessor of Smeaton's bridge. On the left bank of the river lie the suburb of Bridgend and Kinnoull Hill (729 ft.). To the south are the wood-clad heights of Moncrieffe Hill (725 ft.), Magdalenes Hill (596 ft.), Kirkton Hill (540 ft.) and Craigie Wood (407 ft.). In the river are Friarton or Moncrieffe Island and the Stanners.

Notwithstanding the importance of Perth in former times, almost the sole relic of the past is the church of St John the Baptist, a large Decorated cruciform building surmounted by a massive square central tower 155 ft. high. The original edifice is believed to have been erected in the time of Columba, but the transept and nave of the existing structure date from the early part of the 13th century, the choir from the 15th. The church was restored in 1891, and is now divided into the East, Middle and West churches. The silver-gilt communion cup used in the Middle Church is said to have been presented by Queen Mary. In May 1559 John Knox preached in St John's his famous sermon in denunciation of idolatry. The Dominican or Blackfriars' monastery, founded by Alexander II. in 1231, occupied a site near the west end of St John's Bridge; in what is now King Street stood the Carthusian monastery, founded by James I. in 1425; the Franciscan or Greyfriars' monastery, founded in 1460 by Laurance, first Lord Oliphant, stood on the present Greyfriars' cemetery; the Carmelite or Whitefriars' monastery, founded in 1260, stood west of the town. The tombstone of James I. and his queen, who were buried in the Charterhouse, was afterwards removed to St John's East Church. During the period between the beginning of the 12th century and the assassination of James I. in 1437, many of the Scottish parliaments were held in Perth. The building in which they met stood off High Street and was only cleared away in 1818, its site being occupied by the Freemasons' Hall. The earl of Gowrie's palace, built in 1520, stood in spacious grounds near the river and was removed in 1805 to provide room for the county buildings. The castle of Perth stood on the north of High Street, not far from St John's. It was probably built about 860 and demolished about 1400. The Spey or Spy tower, the most important fortress on the city wall, guarded the south gate close to the river, but it was taken down early in the 19th century. The market cross, erected in High Street in 1669 to replace the older cross which Cromwell destroyed, was removed in 1765 as an obstruction. The huge fortress, 466 ft. square, which Cromwell erected in 1651 on the South Inch, close to the river and the Greyfriars' burying-ground, was demolished in 1663. The house of Catherine Glover, the "Fair Maid of Perth," still stands in Curfew Row. James VI.'s Hospital, founded in 1569, occupies the site of the Carthusian monastery, the original structure having been pulled down by Cromwell's orders. The pensioners now live out and the hospital has been converted into artisans' dwellings. Among modern public buildings the principal are St Ninian's Episcopal Cathedral, in the Early Middle Pointed style, an important example (completed 1890) of the work of William Butterfield (1814–1900); the municipal buildings (1881); the city hall; the Marshall Memorial Hall (1823), housing the public library and the museum of the Perth Literary and Antiquarian Society; the Perthshire natural history museum; the Sandeman public library (1898), founded by a bequest of Professor Sandeman of Owens College, Manchester. The general prison for Scotland, south of the South Inch, was originally erected in 1812 as a dépôt for French prisoners, but was remodelled as a convict prison in 1840 and afterwards enlarged. North-west of the city are the military barracks built in 1793-1794. Besides the regular elementary schools there are the Perth Academy (1807), with which was subsequently amalgamated the Burgh Grammar School, an institution supposed to date from the 12th century; Sharp's institute (1860); the Stewart's free school, an industrial school for girls, and the Fechney industrial school. The charitable institutions comprise the royal infirmary, in the Italian style, considerably enlarged since its foundation in 1836; the Murray royal lunatic asylum in Bridgend; the Hillside House in Kinnoull and the small-pox hospital.

From the south the city is entered by the North British railway and the Caledonian railway (which also runs west to St Fillans, east to Dundee and north-west to Aberdeen); and from the north by the Highland railway, the three systems utilizing a general station in the south-west of the town. During the season there is communication with Dundee and other river ports by steamer. The navigation of the stream is considerably obstructed by sandbanks, but vessels of 200 tons can unload at the quays, which, with the town and Friarton harbours, lie below the South Inch. The greatest tidal rise is 13 ft. The chief imports are Baltic timber, coal, salt and manure; and the exports, manufactured goods, grain, potatoes and slates. Perth has long been famous for its dyeing and bleaching, the bleach-fields being mostly situated outside of the city, in convenient proximity to the Tay and Almond. The other leading industries include manufactures of gauge-glasses, ink, muslins, India shawls, jute goods, woollens and winceys, floorcloth, and boots and shoes. There are iron foundries, breweries, distilleries, rope and sail works, coach-building yards, steam joinery works, and brick and tile works. The salmon fisheries of the Tay yield a substantial revenue. Perth is under the jurisdiction of a town council, with a lord provost and bailies, and returns one member to parliament.

History.—During the time that it was occupied by the Romans, a period estimated at 320 years, the city was called Victoria; but shortly after their withdrawal it seems to have borne the Celtic appellation of Aber-tha ("at the mouth of the Tay"). The transition to the latinized form Bertha and later to Perth (the Gaelic name being *Peart*) appears obvious. On the conversion of the original Pictish inhabitants and the dedication of the first church to St John the Baptist, the town

was designated St Johnstoun, and it continued to be known indifferently by this name and that of Perth down to the 17th century. Roman remains have often been found in excavations carried out within the existing boundaries, which suggests that the Roman settlement was at least twenty feet below the present surface. The obscurity of the early annals of the town is explained by the circumstance that Edward I. caused the records to be removed. Perth is stated to have been a burgh in 1106 and was made a royal burgh by William the Lion in 1210. During the Scottish wars of the Independence its fortifications were strengthened by Edward I. (1298). Robert Bruce several times ineffectually attempted to seize it, but in 1311 he succeeded in scaling the walls during a night attack. This was the fourth and most brilliant of the seven sieges which the city has sustained. Taken by Edward III. in 1335, it was recaptured in 1339. In 1396 the combat between the Clan Chattan and the Clan Quhele, described in Scott's *Fair Maid of Perth*, took place on the North Inch in presence of Robert III. and his queen, Annabella Drummond. The Blackfriars' monastery was the scene of the murder of James I. by Walter, earl of Atholl, in 1437. In consequence Perth lost its status as capital, in which it had succeeded to Scone, and the Parliament Courts were transferred to Edinburgh in 1482. Gowrie Palace was the scene of the mysterious "Gowrie" conspiracy against James VI. in 1600. The town was taken by Montrose in 1644, by Cromwell in 1651, and was occupied by Viscount Dundee in 1689. In 1715 the Old Pretender was proclaimed king at the Mercat Cross (Sept. 16), and the chevalier himself appeared in the city in the following January, only to leave it precipitately on the approach of the earl of Argyll. Prince Charles Edward spent a few days in Perth from the 3rd of September 1745. In both rebellions the magistrates took the side of the Crown and were supported by the townsfolk generally, the Jacobites drawing their strength mainly from the county noblemen and gentry with their retainers. Since then the city has devoted itself to the pursuits of trade and commerce. Perth was visited by plague in 1512, 1585–1587, 1608 and 1645; by cholera in 1832; and the floods of 1210, 1621, 1740, 1773 and 1814 were exceptionally severe.

PERTH AMBOY, a city and port of entry of Middlesex county, New Jersey, U.S.A., at the mouth of the Raritan River, on Raritan Bay and Staten Island Sound, about 15 m. S. by W. of Newark. Pop. (1910, U.S. census), 32,121. It is served by the Pennsylvania, Lehigh Valley, Central of New Jersey and Staten Island Rapid Transit railways, and by boats to New York City. It is connected by a railway bridge (C.R.R. of N.J.) and by a foot and wagon bridge with South Amboy, on the south shore of the Raritan. Perth Amboy has a good harbour, shipyards and dry-docks. In the city still stands Franklin Palace (erected in 1764–1774), the home of William Franklin (1729–1813), a natural son of Benjamin Franklin and the last royal governor of New Jersey. In the vicinity is the Bartow House, in which William Dunlap (1766–1839), the art historian, made his first drawings. Other buildings of historic interest are the Parker Castle (*c.* 1729), a centre of Loyalist influence at the time of the War of Independence, and the Kearny Cottage, the home of "Madam Scribblerus," a half-sister of Captain James Lawrence. The city has various manufactures, the factory product in 1905 being valued at $34,800,402. Clay is obtained in the vicinity, and large shipments of coal are made. Perth Amboy was founded in 1683. It was at first called Amboy after the original Indian name; in 1864 the proprietors named it Perth in honour of James, earl of Perth (1648–1716), one of their number, and a few years later the two names were combined. From 1686 until the end of the proprietary government in 1702 Perth Amboy was the capital of the province of East Jersey, and during the period of royal government the general assembly and supreme court of New Jersey met alternately here and at Burlington. Perth Amboy was incorporated as a city in 1718, and received a new charter in 1784, and another in 1844, the last being revised in 1870. The township of Perth Amboy was incorporated in 1693 and in 1844 was included in the city.

PERTHES, FRIEDRICH CHRISTOPH (1772–1843), German publisher, nephew of Johan Georg Perthes (*q.v.*), was born at Rudolstadt on the 21st of April 1772. At the age of fifteen he became an apprentice in the service of Adam Friedrich Böhme, a bookseller in Leipzig, with whom he remained for about six years. In Hamburg, where he settled in 1793 as an assistant to the bookseller B. G. Hoffmann, he started in 1796 a bookselling business of his own, and in 1798 he entered into partnership with his brother-in-law, Johann Heinrich Besser (1775–1826). By his marriage in 1797 with a daughter of the poet, Matthias Claudius, he was brought into intimate relation with a group of Protestant writers, who exercised a powerful influence on the growth of his religious opinions. This, however, did not prevent him from being on friendly terms with a number of eminent Roman Catholic authors. Perthes was an ardent patriot; and during the period of Napoleon's supremacy he distinguished himself by his steady resistance to French pretensions. His zeal for the national cause led him, in 1810–1811, to issue *Das deutsche Museum*, to which many of the foremost publicists in Germany contributed. For some time the French made it impossible for him to live in Hamburg; and when, in 1814, he returned to that city he found that his business had greatly diminished. In 1821, his wife having died, he left Hamburg, transferring his business there to his partner, and went to Gotha, where he established what ultimately became one of the first publishing houses in Germany. It was owing to his initiation that the *Börsenverein der deutschen Buchhändler* (Union of German Booksellers) in Leipzig was founded in 1825. When the foundation-stone of the fine building of the Union was laid in 1834, Perthes was made an honorary freeman of the city of Leipzig, and in 1840 the university of Kiel conferred upon him the degree of doctor of philosophy. Perthes died at Gotha on the 18th of May 1843. His *Life* was written by his son, Klemens Theodor Perthes (1809–1867), professor of law in the university of Bonn, and author of *Das deutsche Staatsleben vor der Revolution* (Hamburg and Gotha, 1845) and *Das Herbergswesen der Handwerksgesellen* (Gotha, 1856, and again 1883), whose son Hermann Friedrich Perthes (1840–1883) was the founder of the Fridericianum at Davos Platz. The publishing business at Gotha was carried on by Perthes's younger son, Andreas, (1813–1890) and his grandson, Emil (1841–), until 1889, when it was handed over to a company.

See also O. Adler, *Friedrich and Karoline Perthes* (Leipzig, 1900).

PERTHES, JOHAN GEORG JUSTUS (1749–1816), German publisher, was born at Rudolstadt on the 11th of September 1749. In 1785 he founded at Gotha the business which bears his name (Justus Perthes). In this he was joined in 1814 by his son Wilhelm (1793–1853), who had been in the establishment of Justus' nephew, Friedrich Christoph Perthes, at Hamburg. On the death of Justus at Gotha on the 2nd of May 1816, Wilhelm took entire control of the firm. He laid the foundation of the geographical branch of the business, for which it is chiefly famous, by publishing the *Hand-atlas* (1817–1823) of Adolf Stieler (1775–1836). Wilhelm Perthes engaged the collaboration of the most eminent German geographers of the time, including Heinrich Berghaus, Christian Gottlieb Reichard (1758–1837), who was associated with Stieler in the compilation of the atlas, Karl Spruner (1803–1892) and Emil von Sydow (1812–1873). The business passed to his son Bernard Wilhelm Perthes (1821–1857), who was associated with August Petermann (under whose direction the well-known periodical *Petermanns Mitteilungen* was founded), and Bruno Hassenstein (1839–1902); and subsequently to his son Bernard (1857–). In 1863 the firm first issued the *Almanach de Gotha*, a statistical, historical and genealogical annual (in French) of the various countries of the

town hall, built entirely by convict labour, stands on an eminence in the very heart of the city; opposite to it are the government offices, housed in a four-storeyed structure in the style of the French Renaissance. The mint, opened in 1899, is a massive freestone building. There are a public library, built as a memorial of Queen Victoria's Jubilee in 1887, a Scots college, two good theatres, a mechanics' institute, a museum, and a fine Wesleyan church-house, known as Queen's Hall. The Perth Park, containing about 1200 acres, is connected by tram with the city, and in it is a well-equipped observatory. There are several smaller parks and squares in the city, while the esplanade gardens are a feature of the place, being thrown out like a pier into Perth Water. There is a good cricket ground, and three race-courses are in easy reach. South Perth, on the other side of the river, is connected by bridges and steam ferry; and adjoining the city on the north-west are the suburban municipalities of Leederville and Subiaco. Outlying suburbs are Belmont, Victoria Park, Burswood, Claremont, Cottesloe, Peppermint Grove and Bayswater. The city is lighted by electricity, and has a good service of electric trams. Perth has an agreeable climate, the mean temperature is 64·9° F., and the average rainfall 33 in. Perth was founded in 1829, received its municipal charter in 1856, and was created a city in 1880. Between 1891 and 1901 the growth of the city was remarkably rapid; in 1891 the population was only 8447, but in 1901 it had grown to 27,471 in the city proper, and to 36,199 including the suburbs.

PERTH, a city, and royal, municipal and police burgh, and county town of Perthshire, Scotland, 32 m. N. by W. of Edinburgh direct, and 47¾ m. by the North British railway, via the Forth Bridge and Kinross Junction. Pop. (1901), 33,566. It is situated on the right bank of the Tay, between the meadows of the North Inch (98 acres) and those of the South Inch (72 acres), both laid out as public parks. The river is crossed by St John's Bridge of nine arches, completed in 1772 from the designs of John Smeaton and widened a century later; by Victoria Bridge, a modern structure connecting South Street with Dundee Road; and farther south (at the end of Tay Street) by a footway alongside of the viaduct belonging to the Caledonian railway. Of earlier bridges one, which crossed at High Street, was swept away by the flood of 1621, and another, constructed by General Wade in 1723-1733, was apparently the predecessor of Smeaton's bridge. On the left bank of the river lie the suburb of Bridgend and Kinnoull Hill (729 ft.). To the south are the wood-clad heights of Moncrieffe Hill (725 ft.), Magdalenes Hill (596 ft.), Kirkton Hill (540 ft.) and Craigie Wood (407 ft.). In the river are Friarton or Moncrieffe Island and the Stanners.

Notwithstanding the importance of Perth in former times, almost the sole relic of the past is the church of St John the Baptist, a large Decorated cruciform building surmounted by a massive square central tower 155 ft. high. The original edifice is believed to have been erected in the time of Columba, but the transept and nave of the existing structure date from the early part of the 13th century, the choir from the 15th. The church was restored in 1891, and is now divided into the East, Middle and West churches. The silver-gilt communion cup used in the Middle Church is said to have been presented by Queen Mary. In May 1559 John Knox preached in St John's his famous sermon in denunciation of idolatry. The Dominican or Blackfriars' monastery, founded by Alexander II. in 1231, occupied a site near the west end of St John's Bridge; in what is now King Street stood the Carthusian monastery, founded by James I. in 1425; the Franciscan or Greyfriars' monastery, founded in 1460 by Laurance, first Lord Oliphant, stood on the present Greyfriars' cemetery; the Carmelite or Whitefriars' monastery, founded in 1260, stood west of the town. The tombstone of James I. and his queen, who were buried in the Charterhouse, was afterwards removed to St John's East Church. During the period between the beginning of the 12th century and the assassination of James I. in 1437, many of the Scottish parliaments were held in Perth. The building in which they met stood off High Street and was only cleared away in 1818, its site being occupied by the Freemasons' Hall. The earl of Gowrie's palace, built in 1520, stood in spacious grounds near the river and was removed in 1805 to provide room for the county buildings. The castle of Perth stood on the north of High Street, not far from St John's. It was probably built about 860 and demolished about 1400. The Spey or Spy tower, the most important fortress on the city wall, guarded the south gate close to the river, but it was taken down early in the 19th century. The market cross, erected in High Street in 1669 to replace the older cross which Cromwell destroyed, was removed in 1765 as an obstruction. The huge fortress, 466 ft. square, which Cromwell erected in 1651 on the South Inch, close to the river and the Greyfriars' burying-ground, was demolished in 1663. The house of Catherine Glover, the "Fair Maid of Perth," still stands in Curfew Row. James VI.'s Hospital, founded in 1569, occupies the site of the Carthusian monastery, the original structure having been pulled down by Cromwell's orders. The pensioners now live out and the hospital has been converted into artisans' dwellings. Among modern public buildings the principal are St Ninian's Episcopal Cathedral, in the Early Middle Pointed style, an important example (completed 1890) of the work of William Butterfield (1814–1900); the municipal buildings (1881); the city hall; the Marshall Memorial Hall (1823), housing the public library and the museum of the Perth Literary and Antiquarian Society; the Perthshire natural history museum; the Sandeman public library (1898), founded by a bequest of Professor Sandeman of Owens College, Manchester. The general prison for Scotland, south of the South Inch, was originally erected in 1812 as a dépôt for French prisoners, but was remodelled as a convict prison in 1840 and afterwards enlarged. North-west of the city are the military barracks built in 1793-1794. Besides the regular elementary schools there are the Perth Academy (1807), with which was subsequently amalgamated the Burgh Grammar School, an institution supposed to date from the 12th century; Sharp's institute (1860); the Stewart's free school, an industrial school for girls, and the Fechney industrial school. The charitable institutions comprise the royal infirmary, in the Italian style, considerably enlarged since its foundation in 1836; the Murray royal lunatic asylum in Bridgend; the Hillside House in Kinnoull and the small-pox hospital.

From the south the city is entered by the North British railway and the Caledonian railway (which also runs west to St Fillans, east to Dundee and north-west to Aberdeen); and from the north by the Highland railway, the three systems utilizing a general station in the south-west of the town. During the season there is communication with Dundee and other river ports by steamer. The navigation of the stream is considerably obstructed by sandbanks, but vessels of 200 tons can unload at the quays, which, with the town and Friarton harbours, lie below the South Inch. The greatest tidal rise is 13 ft. The chief imports are Baltic timber, coal, salt and manure; and the exports, manufactured goods, grain, potatoes and slates. Perth has long been famous for its dyeing and bleaching, the bleach-fields being mostly situated outside of the city, in convenient proximity to the Tay and Almond. The other leading industries include manufactures of gauge-glasses, ink, muslins, India shawls, jute goods, woollens and winceys, floorcloth, and boots and shoes. There are iron foundries, breweries, distilleries, rope and sail works, coach-building yards, steam joinery works, and brick and tile works. The salmon fisheries of the Tay yield a substantial revenue. Perth is under the jurisdiction of a town council, with a lord provost and bailies, and returns one member to parliament.

History.—During the time that it was occupied by the Romans, a period estimated at 320 years, the city was called Victoria; but shortly after their withdrawal it seems to have borne the Celtic appellation of Aber-tha ("at the mouth of the Tay"). The transition to the latinized form Bertha and later to Perth (the Gaelic name being *Peart*) appears obvious. On the conversion of the original Pictish inhabitants and the dedication of the first church to St John the Baptist, the town

direction via Perth. At Crieff junction it sends off a branch to Crieff and at Perth branches to Dundee and Lochearnhead. The Stirling to Oban line of the same company crosses the shire from Dunblane to Tyndrum. The Highland railway runs northwards from Perth, and has a branch at Ballinluig to Aberfeldy. Branches of the North British railway reach Perth from Mawcarse in Kinross-shire and Ladybank in Fifeshire; part of the branch from Buchlyvie on the Forth and Clyde line runs to Aberfoyle, and the West Highland railway skirts the extreme west of the shire. At several points coaches supplement the rail. In the tourist season steamers ply on Loch Tay and Loch Katrine, and there is a service on the Tay between Perth and Dundee.

Population and Administration.—In 1891 the population amounted to 122,185 and in 1901 to 123,283, or 49 persons to the sq. m. The rate of increase was the smallest of any Scottish county for the decade. In 1901 there were 78 persons speaking Gaelic only and 11,446 Gaelic and English. The chief towns are Perth (pop. 32,873), Crieff (5208), Blairgowrie (3378), Dunblane (2516), Auchterarder (2276), Coupar-Angus (2064), Rattray (2019). Among lesser centres may be mentioned Aberfeldy (1508), a favourite resort on the Tay, well known for the falls of Moness, mentioned in Robert Burns's song "The Birks of Aberfeldy"; Abernethy (623), the seat of an early bishopric, retaining one of the three ancient round towers in Scotland; Alyth (1965); Callander (1458); Comrie (1118), a holiday resort on the Earn; Pitlochry (1541); and Stanley (1035), on the Tay. Of old the county was divided into hereditary jurisdictions, which were abolished in 1748, and in 1795 the county was divided into districts for administrative purposes, a system which obtained until 1889, when county and district councils were established. The sheriffdom is divided into an eastern and western district, the seat of the one being Perth and the other Dunblane. For parliamentary purposes the county is also divided into an eastern and a western division, and the city of Perth returns a member. The shire is under school-board jurisdiction, and there are secondary schools at Perth and Crieff, and Trinity College in Glen Almond is a well-known public school on the English model.

History.—In 83 Agricola explored the lands beyond the Forth and in the following year penetrated to the Grampians, defeating the Caledonians under Galgacus with great slaughter. The site of this battle is conjectured by William Forbes Skene to have been near Meikleour, south of Blairgowrie, but other writers have referred it to Dalginross, near Comrie; to Ardoch (where there are the most perfect remains of a Roman encampment in the British Isles); and even as far north as Raedykes, near Stonehaven in Kincardineshire. The Romans did not pursue their victory, and the Picts were left undisturbed for a considerable period. At this time, according to Ptolemy, the territory now known as Perthshire was occupied by three tribes—the Damnonii, the Venicones and the Vacomagi. The Damnonii held Menteith, Strathearn and Fothrif (the western part of modern Fife and Kinross), with Alauna (Allan), just above Stirling, Lindum (Ardoch) and Victoria (believed by some authorities to be Lochore in Fifeshire, and by others to be Perth city), as their chief towns. The Venicones inhabited north-western Fife and the adjoining tract of Perthshire, with Orrea (probably Abernethy) as their chief town and a station at Ardargie. The Vacomagi dwelt in the Highland region, with stations at Inchtuthil (a peninsula in the Tay above Kinclaven) and Banatia (Buchanty on the Almond). The growing lawlessness of the southern Picts and their frequent raids in the more settled country in the south at last compelled the attention of the emperor Severus. He arrived in Britain in 208, but though he led a strong army to the shores of the Moray Firth, he was unable effectually to subdue the tribesmen. The road he constructed ran from Stirling to Ardoch (where there are notable remains) and thence by Strageath, near Muthill, where it branched north-westwards to Dalginross and Buchanty, and north-eastwards to Perth and so to the Grampians. When the Romans finally withdrew from Britain, the Picts established their capital first at Abernethy and then at Forteviot. Abernethy was the centre of the Celtic church after the conversion of the natives by Ninian, Palladius and other missionaries in the 5th and 6th centuries. On the burning of Forteviot by the Norsemen in the 8th century, the seat of Pictish government was removed to Scone. In the latter half of the 9th century Dunkeld—to which Kenneth Macalpine had brought some of the relics of Columba from Iona—became the scene of monastic activity, the abbot succeeding to the position of the abbot of Iona, and exercising great influence for nearly a hundred years. The Danes periodically harried the land, but a crushing defeat at Luncarty in 961 put an end to their inroads in this quarter. In 1054 Macbeth was defeated at Dunsinane by Siward, earl of Northumberland, who had invaded Scotland in the interest of his kinsman, Duncan's son, who, on the death of the usurper three years later, ascended the throne as Malcolm III., called Canmore. With Malcolm's accession the Celtic rule of the monarchy of Scone came to an end. Nevertheless, the Scottish sovereigns (excepting James II., James III. and Mary) continued to be crowned at Scone, which also retained the position of capital until the beginning of the 12th century, when it was displaced by Perth. From the time of Alexander I. (d. 1124), therefore, the history of the shire is merged in that of the county town, with the exception of such isolated incidents as the removal of the Coronation Stone from Scone to Westminster in 1296, the defeat of Robert Bruce at Methven in 1306, the battle of Dupplin in 1332, the victory of Dundee at Killiecrankie in 1689 and the indecisive contest at Sheriffmuir in 1715. Among archaeological remains may be mentioned the hill-fort on Dunsinane; the ship-barrow of the vikings at Rattray, weems (or earth-houses) in the parishes of Monzie, Alyth and Bendochy; the witch-stone near Cairnheddie, one of the numerous spots where Macbeth is alleged to have met the witches, but probably a sepulchral memorial of some forgotten battle; standing stones near Pitlochry, and an extraordinary assemblage of sculptured stones at Meigle.

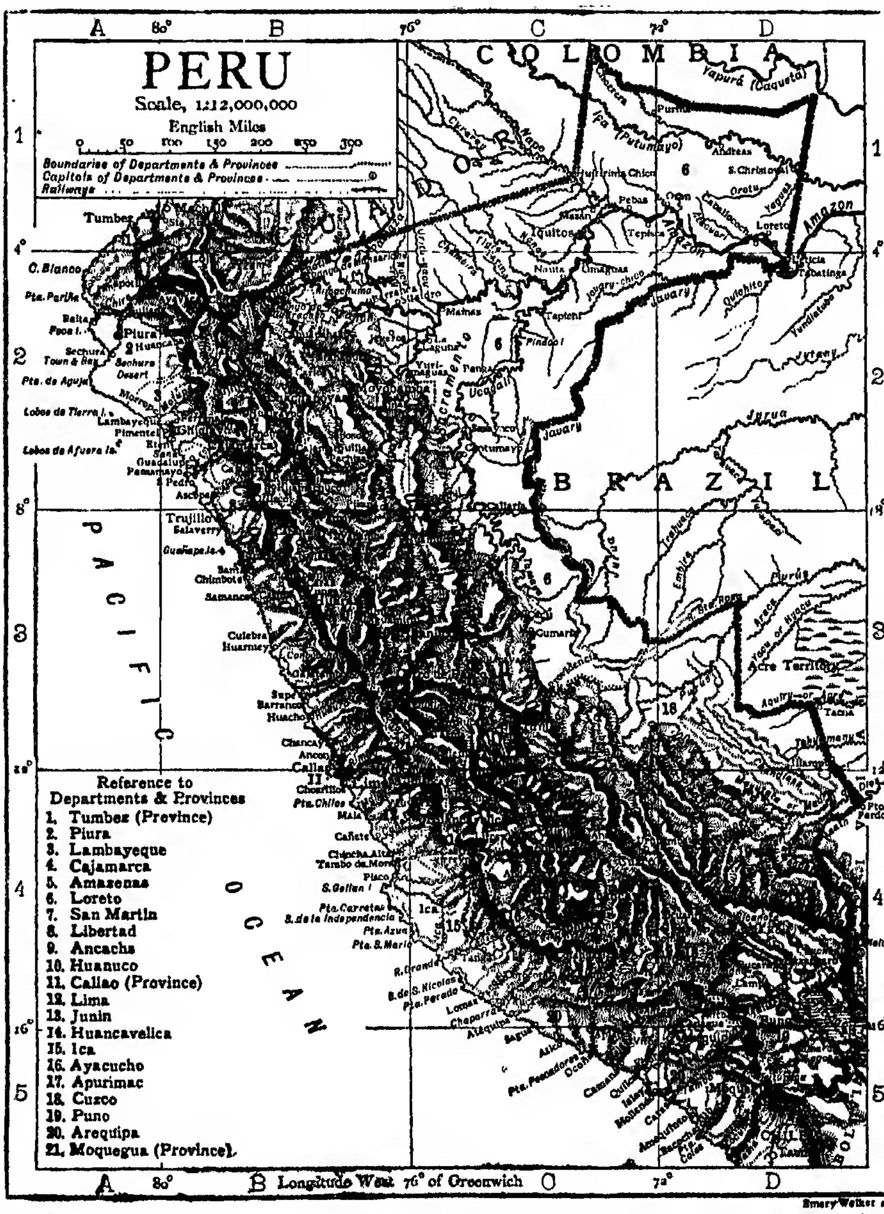
PERTINAX, PUBLIUS HELVIUS (A.D. 126–193), Roman emperor, the son of a charcoal-burner, was born at Alba Pompeia in Liguria. From being a teacher of grammar he rose through many important offices, both civil and military, to the consulate, which he held twice. Chosen, at an advanced age and against his will, on the 1st of January 193, to succeed Commodus, he was himself assassinated in a mutiny of the soldiers, on the 28th of March 193.

PERTZ, GEORG HEINRICH (1795–1876), German historian, was born at Hanover on the 28th of March 1795. From 1813 to 1818 he studied at Göttingen, chiefly under A. H. L. Heeren. His graduation thesis, published in 1819, on the history of the Merovingian mayors of the palace, attracted the attention of Baron Stein, by whom he was engaged in 1820 to edit the Carolingian chroniclers for the newly founded Historical Society of Germany. In search of materials for this purpose, Pertz made a prolonged tour through Germany and Italy, and on his return in 1823 he received at the instance of Stein the principal charge of the publication of *Monumenta germaniae historica*, texts of all the more important historical writers on German affairs down to the year 1500, as well as of laws, imperial and regal archives, and other valuable documents, such as letters, falling within this period. Pertz made frequent journeys of exploration to the leading libraries and public record offices of Europe, publishing notes on the results of his explorations in the *Archiv. der Gesellsch. f. deutsche Geschichtskunde* (1824–1872). In 1823 he had been made secretary of the archives, and in 1827 principal keeper of the royal library at Hanover; from 1832 to 1837 he edited the *Hannoverische Zeitung*, and more than once sat as a representative in the Hanoverian second chamber. In 1842 he was called as chief librarian to Berlin, where he shortly afterwards was made a privy councillor and a member of the Academy of Sciences. He resigned all his appointments in

1874, and on the 7th of October 1876 died at Munich while attending the sittings of the historical commission.

The *Monumenta* began to appear in 1826, and at the date of his resignation 24 volumes folio (*Scriptores, Leges, Diplomata*) had appeared. This work for the first time made possible the existence of the modern school of scientific historians of medieval Germany. In connexion with the *Monumenta* Pertz also began the publication of a selection of sources in octavo form, the *Scriptores rerum germanicarum in usum scholarum*; among his other literary labours may be mentioned an edition of the *Gesammelte Werke* of Leibnitz, and a life of Stein (*Leben des Ministers Freiherrn vom Stein* (6 vols., 1849–1855); also, in an abridged form, *Aus Steins Leben* (2 vols., 1856).



PERU (apparently from *Biru*, a small river on the west coast of Colombia, where Pizarro landed), a republic of the Pacific coast of South America, extending in a general N.N.W.–S.S.E. direction from lat. 3° 21′ S. to about 18° S., with a sea-coast of 1240 m. and a width of 300 to 400 m., exclusive of territories in dispute. Its area in 1906, including Tacna and Arica, and other disputed territories occupied by neighbouring states, was officially estimated at 1,752,422 sq. kilometers, or 676,638 sq. m.; exclusive of these territories, the area of Peru is variously estimated at 439,000 to 480,000 sq. m., the Gotha measurements being 1,137,000 sq. kilometers, or 439,014 sq. m.

With the exception of parts of the Ecuador, Brazil and Bolivia frontiers, all the boundary lines have been disputed and referred to arbitration—those with Colombia and Ecuador to the king of Spain, and that with Bolivia to the president of Argentina, on which a decision was rendered on the 9th of July 1909. There have been misunderstandings with Ecuador in regard to some small areas in the Chira valley, but it may be assumed that the line is fixed between Santa Rosa (3° 21′ S.) on the Gulf of Guayaquil, and the Chinchipe river, a tributary of the Marañon. At the junction of the Cauches with that river, the Ecuadorean line descends the Chinchipe to the Marañon, and the Peruvian ascends to a point where it is intersected by a line following the eastern Cordillera northward to the headwaters of the Caquetá, or Japurá, which forms the northern boundary down to the Brazilian frontier. This claim covers all eastern Ecuador and a large part of south-eastern Colombia. In 1903 there were encounters between small bodies of Peruvian and Ecuadorean troops on the disputed frontier. After arbitration by the king of Spain had been agreed upon, the question was considered by two Spanish commissions, and modifications favouring Peru were recommended. These became known prematurely, and in May 1910 war was threatened between Peru and Ecuador in spite of an offer of mediation by the United States, Brazil and Argentina under the Hague Convention.

From the Japurá southward to the Amazon, in 4° 13′ 21″ S., 69° 35′ W., and thence up the Javary, or Yavari, to its source in 7° 8′ 4″ S., 73° 46′ 30″ W., as determined by a mixed commission, the line has been definitely settled. From near the source of the Javary, or lat. 7° 1′ 17″ S., a line running eastward to the Madeira in lat. 6° 52′ 15″ S., which is half the distance between the mouth of the Mamoré and the mouth of the Madeira, divides the Spanish and Portuguese possessions in this part of South America, according to the provisions of the Treaty of San Ildefonso of 1777. This line has been twice modified by treaties between Bolivia and Brazil, but without the consent of Peru, which claimed all the territory eastward to the Madeira between the above-mentioned line and the Beni-Madidi rivers, the line of demarcation following the Pablo-bamba, a small tributary of the Madidi, to its source, and thence in a straight line to the village of Conima, on Lake Titicaca. The dispute with Brazil relates to the territory acquired by that republic from Bolivia in 1867 and 1903, and was to be settled, according to an agreement

of 1908, by direct negotiation if possible, or, failing this, by arbitration. The decision of the president of Argentina of the 9th of July 1909, in regard to the remainder of this extensive territory, was a compromise, and divided it into two nearly equal parts. The line adopted starts from Lake Suches, the source of a small river of that name flowing into the north of Lake Titicaca, crosses the Cordillera by the Palomani to the Tambopata River, follows that stream to the mouth of the Lanza, thence crosses to the source of the Heath River, which forms the dividing line down to its junction with the Madre de Dios, descends that river to the mouth of the Torosmonas, thence in a straight line north-westerly to the intersection of the Tahuamanu River by the 69th meridian, and thence north on that meridian to the Brazilian frontier. This decision at first gave offence to the Bolivians, but friendly overtures from Peru led to its acceptance by both parties with the understanding that modifications would be made in locating the line wherever actual settlements had been made by either party on territory awarded to the other. With Chile the *de jure* line is that of the Camarones ravine which separated the old department of Moquegua (including the provinces of Tacna and Arica) from that of Tarapacá. The *de facto* line is that of the Sama River (usually dry), which opens on the coast a little south of Sama point, near 18° S., Chile retaining possession of the two above-mentioned provinces in violation of the Treaty of Ancon, which she forced upon her defeated antagonist.

Physical Geography.—Peru is divided longitudinally into three well-defined regions, the coast, the sierra and the montaña. The coast, extending from the base of the Western or Maritime Cordillera to the Pacific Ocean, consists of a sandy desert crossed at intervals hy rivers flowing through narrow, fertile valleys. The sierra is the region of the Andes, and is about 250 m. in width. It contains stupendous chains of mountains, elevated plains and table-lands, warm and fertile valleys and ravines. The montaña is the region of tropical forests within the valley of the Amazon, and skirts the eastern slopes of the Andes.

The Coast.

The coast has heen upraised from the ocean at no very distant geological epoch, and is nearly as destitute of vegetation as the African Sahara. It is watered, however, hy fifty streams which cross the desert at intervals. Half of these have their origin in the summits of the Andes, and run with a permanent supply of water into the ocean. The others, rising in the outer range, which does not reach the snow-line and receives less moisture, carry a volume of water to the sea during the rainy season, hut for the rest of the year are nearly dry. The absence of rain here is ascribed to the action of the lofty uplands of the Andes on the trade-wind, and to the influence of the cold Humboldt current sweeping northward along the west coast of the continent. The south-east trade-wind hlows ohliquely across the Atlantic Ocean until it reaches Brazil. By this time it is heavily laden with vapour, which it continues to bear along across the continent, depositing it and supplying the sources of the Amazon and La Plata. When the wind rises above the snow-capped Andes, the last particle of moisture is wrung from it that a very low temperature can extract. Passing the summit of that range, it rushes down as a cool and dry wind on the Pacific slopes beyond. Meeting with no evaporating surface, and with no temperature colder than that to which it is suhjected on the mountain-tops, this wind reaches the ocean before it becomes charged with fresh moisture. The constantly prevalling wind on the Peruvian coast is from the south, which is a cold wind from the Humboldt current. As it moves north it becomes gradually warmed and takes up moisture instead of depositing it as rain. From Novemher to April there are usually constant dryness, a clear sky, and considerahle, though hy no means oppressive, heat. From June to September the sky is ohscured for weeks together by fog, which is often accompanled hy drizzling rain called *garua*. At the time when it is hottest and driest on the coast it is raining heavily in the Andes, and the rivers are full. When the rivers are at their lowest, the *garua* prevails on the coast. The climate of various parts of the coast, however, is modified by local circumstances.

The Western Cordillera, overhanging the Peruvian coast, contains a long line of volcanic mountains, most of them inactive, but their presence is probably connected with the frequent and severe earthquakes, especially in the southern section of the coast. Since 1570 seventy violently destructive earthquakes have been recorded on the west coast of South America, but the register is incomplete in its earlier part. The most terrible was that of 1746, which destroyed Callao, on the 28th of October, and there were 220 shocks in the following twenty-four hours. The town was overwhelmed by a vast wave, which rose 80 ft.; and the shocks continued until the following February. On the 13th of August 1868 an earthquake nearly destroyed Arequipa, and great waves rolled in upon the ports of Arica and Iquique. On the 9th of May 1877 nearly all the southern ports were overwhelmed.

The deserts between the river-valleys vary in extent, the largest being more than 70 r . across. On their western margin steep cliffs generally rise from the sea, above which is the *tablaso* or plateau, in some places slightly undulating, in others with ridges of considerable height rising out of it. The surface is generally hard, but in many places there are large accumulations of drifting sea-sand. The sand usually forms isolated hillocks, called *medanos*, of a half-moon shape, having their convex sides towards the trade-wind. They are from 10 to 20 ft. high, with an acute crest, the inner side perpendicular, the outer with a steep slope. Sometimes, especially at early dawn, there is a musical noise in the desert, like the sound of distant drums, which is caused hy the eddying of grains of sand in the heated atmosphere, on the crests of the *medanos*.

Coast Flora.

Apparently the deserts are destitute of all vegetation; yet three kinds of herbs exist, which hury themselves deep in the earth, and survive long periods of drought. One is an amaranthaceous plant, whose stems ramify through the sandhills; the other two are a *Martynia* and an *Aniseia*, which maintain a suhterranean existence during many years, and only produce leafy stems in those rare seasons when sufficient moisture penetrates to the roots. In a few hollows which are reached by moisture the trees of the desert find support, the *algarrobo* (*Prosopis horrida*), a low tree of very scraggy growth, the *tichaya* (*Capparis crotonoides*), and the *zapote del perro* (*Colicodendrum scabridum*), mere shrubs. Near the Cordillera and on its lower slopes a tall hranched cactus is met with, and there are *Salicornias* and *Salsolas* near the coast. But, when the mists set in, the low hills near the coast bordering the deserts, which are called *lomas*, undergo a change as if hy magic. A hlooming vegetation of wild flowers for a short time covers the barren hills. Near Lima one of the low ranges is hrightened hy the beautiful yellow lily called *amancaes* (*Ismene amancaes*). The other flowers of the *lomas* are the *papita de San Juan* (*Begonia geranifolia*), with red petals contrasting with the white inner sides, valerians, the beautiful *Bomarea ovata*, several species of *Oxalis*, *Solanum* and crucifers. But this carpet of flowers is very partially distrihuted and lasts but a short time.

The valleys form a marvellous contrast to the surrounding desert. A great mass of pale-green foliage is usually composed of the *algarrobo* trees, while the course of the river is marked hy lines or groups of palms, hy fine old willows (*Salix humboldtiana*), fruit-gardens, and fields of cotton, Indian corn, sugar-cane and alfalfa (lucerne). In some valleys there are expanses of sugar-cane, in others cotton, whilst in others vineyards and olive-yards predominate. The woods of *algarrobo* are used for pasture, cattle and horses enjoying the pendulous yellow pods.

Sections of the Coast.

For purposes of description the coast-region of Peru may be divided into five sections, heginning from the north: (1) the Piura region; (2) the Lambayeque and Trujillo section; (3) the Santa valleys; (4) the section from Lima to Nasca; (5) the Arequipa and Tacna section.

(1) The great desert-region of Piura extends for nearly 200 m. from the Gulf of Guayaquil to the horders of the Morrope Valley, and is traversed hy three rivers—the Tumhes, Chira and Piura, the two former receiving their waters from the Inner Cordillera and breaking through the outer range. It is here that the coast of South America extends farthest to the westward until it reaches Capes Blanco and Pariña, and then turns southward to the Bay of Paita. The climate of Piura is modified hy the lower latitude, and also by the vicinity of the forests of Guayaquil. Fog and *garua* are much less frequent than in the coast-region farther south, while rain sometimes falls. At intervals of three or four years there are occasional heavy showers of rain from February to April. (2) The second section of the coast-region includes the valleys of the Morrope, the Chiclayo, and Lambayeque, the Saña, the Jequetepeque, the Chicama, Moche, Viru and Chao. With the intervening deserts this section extends over 200 m. All these valleys, except Morrope and Chao, are watered by rivers which have their sources far in the recesses of the mountains, and which furnish an abundant supply in the season when irrigation is needed. (3) The third section, also extending for 200 m., contains the valleys of Santa, Nepeña, Casma, Huarmey, Fortaleza, Pativilca, Supé and Huaura. The river Santa, which rises in the lake of Conococha, 12,907 ft. above the sea, and has a length of 180 m., is remarkable for its long course between the outer and central ranges of the Andes, in a trough known as the "Callejon de Huaylas," 100 m. in length. It then breaks through in a deep gorge, and reaches the sea after a course of 35 m. over the coast-belt, and after fertilizing a rich valley. The Santa and Nepeña valleys are separated by a desert 8 leagues in width, on the shores of which there is a good anchorage in the bay of Ferrol, where the port of Chimbote is the terminus of a railway. The Nepeña, Casma, Huarmey, Fortaleza and Supé rivers rise on the slope of an outer range called the Cordillera Negra, and are consequently dry during the great part of the year. Wells are dug in their beds, and the fertility of the valleys is thus maintained. The Pativilca (or Barranca) River and the Huaura break

1874, and on the 7th of October 1876 died at Munich while attending the sittings of the historical commission.

The *Monumenta* began to appear in 1826, and at the date of his resignation 24 volumes folio (*Scriptores, Leges, Diplomata*) had appeared. This work for the first time made possible the existence of the modern school of scientific historians of medieval Germany. In connexion with the *Monumenta* Pertz also began the publication of a selection of sources in octavo form, the *Scriptores rerum germanicarum in usum scholarum*; among his other literary labours may be mentioned an edition of the *Gesammelte Werke* of Leibnitz, and a life of Stein (*Leben des Ministers Freiherrn vom Stein* (6 vols., 1849–1855); also, in an abridged form, *Aus Steins Leben* (2 vols., 1856).

PERU (apparently from *Biru*, a small river on the west coast of Colombia, where Pizarro landed), a republic of the Pacific coast of South America, extending in a general N.N.W.–S.S.E. direction from lat. 3° 21′ S. to about 18° S., with a sea-coast of 1240 m. and a width of 300 to 400 m., exclusive of territories in dispute. Its area in 1906, including Tacna and Arica, and other disputed territories occupied by neighbouring states, was officially estimated at 1,752,422 sq. kilometers, or 676,638 sq. m.; exclusive of these territories, the area of Peru is variously estimated at 439,000 to 480,000 sq. m., the Gotha measurements being 1,137,000 sq. kilometers, or 439,014 sq. m.

With the exception of parts of the Ecuador, Brazil and Bolivia frontiers, all the boundary lines have been disputed and referred to arbitration—those with Colombia and Ecuador to the king of Spain, and that with Bolivia to the president of Argentina, on which a decision was rendered on the 9th of July 1909. There have been misunderstandings with Ecuador in regard to some small areas in the Chira valley, but it may be assumed that the line is fixed between Santa Rosa (3° 21′ S.) on the Gulf of Guayaquil, and the Chinchipe river, a tributary of the Marañon. At the junction of the Cauches with that river, the Ecuadorean line descends the Chinchipe to the Marañon, and the Peruvian ascends to a point where it is intersected by a line following the eastern Cordillera northward to the headwaters of the Caquetá, or Japurá, which forms the northern boundary down to the Brazilian frontier. This claim covers all eastern Ecuador and a large part of south-eastern Colombia. In 1903 there were encounters between small bodies of Peruvian and Ecuadorean troops on the disputed frontier. After arbitration by the king of Spain had been agreed upon, the question was considered by two Spanish commissions, and modifications favouring Peru were recommended. These became known prematurely, and in May 1910 war was threatened between Peru and Ecuador in spite of an offer of mediation by the United States, Brazil and Argentina under the Hague Convention.

From the Japurá southward to the Amazon, in 4° 13′ 21″ S., 69° 35′ W., and thence up the Javary, or Yavari, to its source in 7° 8′ 4″ S., 73° 46′ 30″ W., as determined by a mixed commission, the line has been definitely settled. From near the source of the Javary, or lat. 7° 1′ 17″ S., a line running eastward to the Madeira in lat. 6° 52′ 15″ S., which is half the distance between the mouth of the Mamoré and the mouth of the Madeira, divides the Spanish and Portuguese possessions in this part of South America, according to the provisions of the Treaty of San Ildefonso of 1777. This line has been twice modified by treaties between Bolivia and Brazil, but without the consent of Peru, which claimed all the territory eastward to the Madeira between the above-mentioned line and the Beni–Madidi rivers, the line of demarcation following the Pablo-bamba, a small tributary of the Madidi, to its source, and thence in a straight line to the village of Conima, on Lake Titicaca. The dispute with Brazil relates to the territory acquired by that republic from Bolivia in 1867 and 1903, and was to be settled, according to an agreement

Lake Junin, or Chinchay-cocha, in the second section, is 36 m. long by 7 m. broad, and 13,232 ft. above the sea. Its marshy banks are overgrown with reeds and inhabited by numerous water-fowl. From this lake the river Xauxa flows southwards through a populous valley for 150 m. before entering the forests. Lake Titicaca (see BOLIVIA), in the fourth or most southern section, is divided between Peru and Bolivia. It receives a number of short streams from the ranges shutting in the upper end of the valley; the largest is the Ramiz, formed by the two streams of Pucara and Azangaro, both coming from the Knot of Vilcañota to the north. The Suches, which has its source in Lake Suches, falls into Lake Titicaca on the north-west side, as well as the Yllpa and Ylave. The principal islands are Titicaca and Coati (at the south end near the peninsula of Copacabana), Campanaria (9 m. from the east shore), Soto and Esteves. There are two other lakes in the *Collao*, as the elevated region round Titicaca is called. Lake Arapa, a few miles from the northern shore of Titicaca, is 30 m. in circumference. Lake Umayo is on higher ground to the westward. The lake in Peru which is third in size is that of Parinacochas on the coast watershed, near the foot of the snowy peak of Sarasara. It is 12 m. long by 6 broad, but has never been visited and described by any modern traveller. The smaller alpine lakes, often forming the sources of rivers, are numerous.

The great rivers of the sierra are the Marañon, rising in the lake of Lauricocha and flowing northward in a deep gorge between the Maritime and Central Cordilleras for 350 m., when it forces its way through the mountains at the famous Pongo de Manseriche and enters the Amazonian plain. The Huallaga rises north of Cerro Pasco, and, passing Huanuco, flows northwards on the other side of the Central Cordillera for 300 m. It breaks through the range at the Pongo de Chasuta and falls into the Marañon. The other great rivers are tributaries of the Ucayali. The Pozuzu, flowing eastward from the Knot of Cerro Pasco, joins the Pachitea, which is the most important northern affluent of the Ucayali. The Xauxa, becoming afterwards the Mantaro, receives the drainage of Xauxa, Huancavelica and Ayacucho. The southern valleys of this part of the sierra furnish streams which form the main rivers of Pampas, Pachachaca and Apurimac. These, uniting with the Mantaro, form the Ené, and the Ené and Perené (which drains the province of Tambo) form the Tambo. The Vilcamayu rises on the Knot of Vilcañota, flows north through a lovely valley, receives the Yanatilde and Paucartambo on its right bank, and, uniting with the Tambo, forms the Ucayali. Most of these main streams flow through profound gorges in a tropical climate, while the upper slopes yield products of the temperate zone, and the plateaus above are cold and bleak, affording only pasture and the hardiest cereals.

Sierran Flora and Fauna.

The great variety of elevation within the sierra produces vegetation belonging to every zone. There is a tropical flora in the deep gorges, higher up a sub-tropical, then a temperate, then a sub-arctic flora. In ascending from the coast-valleys there is first an arid range, where the great-branched cacti rear themselves up among the rocks. Farther inland, where the rains are more plentiful, is the native home of the potato. Here also are other plants with edible roots—the *oca* (*Oxalis tuberosa*), *ulluca* (*Ullucus tuberosus*), *massua* (*Tropæolum tuberosum*), and *learcó* (*Polymnia sonchifolia*). Among the first wild shrubs and trees that are met with are the *chilca* (*Baccharis Feuillei*), with a pretty yellow flower, the *Mutisia acuminata*, with beautiful red and orange flowers, several species of *Senecio*, calceolarias, the *Schinus molle*, with its graceful branches and bunches of red berries, and at higher elevations the *lambras* (*Alnus acuminata*), the *sauco* (*Sambucus peruviana*), the *quenuar* (*Buddleia incana*), and the *Polylepis racemosa*. The *Buddleia*, locally called *oliva silvestre*, flourishes at a height of 12,000 ft. round the shores of Lake Titicaca. The most numerously represented family is the *Compositae*, the grasses being next in number. The temperate valleys of the sierra yield fruits of many kinds. Those indigenous to the country are the delicious *chirimoyas*, *paltas* or alligator pears, the *paccay*, a species of *Inga*, the *lucma*, and the *granadilla* or fruit of the passion-flower. Vineyards and sugar-cane yield crops in the warmer ravines; the sub-tropical valleys are famous for splendid crops of maize; wheat and barley thrive on the mountain slopes; and at heights from 7000 to 13,000 ft. there are crops of *quinua* (*Chenopodium quinua*). In the loftiest regions the pasture chiefly consists of a coarse grass (*Stipa ychu*), of which the llamas eat the upper blades and the sheep browse on the tender shoots beneath. There are also two kinds of shrubby plants, a thorny *Composita* called "ccaalli" and another, called "tola," which is a resinous *Baccharis* and is used for fuel.

The animals which specially belong to the Peruvian Andes are the domestic llamas and alpacas and the wild vicuñas. There are deer, called *taruco* (*Cervus antisensis*); the *viscacha*, a large rodent; a species of fox called *atoc*; and the puma (*Felis concolor*) and *ucumari* or black bear with a white muzzle, when driven by hunger, wander into the loftier regions. The largest bird is the condor, and there is another bird of the vulture tribe, with a black and white wing feather formerly used by the Incas in their head-dress, called the *coraquenque* or *alcamari*. The *pito* is a brown speckled creeper which flutters about the rocks. There is a little bird, the size of a starling, with brown back striped with black, and white breast, which the Indians call *yncahualpa*; it utters a monotonous sound at each hour of the night. A partridge called *yutu* frequents the long grass. On the lakes there is a very handsome goose, with white body and dark-green wings shading into violet, called *huachua*, two kinds of ibis, a large gull (*Larus serranus*) frequenting the alpine lakes in flocks, flamingoes called *parihuana*, ducks and water-hens. Many pretty little finches fly about the maize-fields and fruit-gardens, and a little green parakeet is met with as high as 12,000 ft. above the sea.

Montana.

The third division of Peru is the region of the tropical forests, at the base of the Andes, and within the basin of the Amazon. It is traversed by great navigable rivers. The Marañon, having burst through the defile of the Pongo de Manseriche (575 ft. above sea level), and the Huallaga through that of Chasuta, enter the forests and unite after separate courses of about 600 and 400 m., the united flood then flowing eastward to the Brazilian frontier. After 150 m. it is joined by the Ucayali, a great navigable river with a course of 600 m. The country between the Huallaga and the Ucayali, traversed by the Eastern Cordillera, is called the Pampa del Sacramento, and is characterized by extensive grassy plains. The forests drained by the Marañon, Huallaga and Ucayali form the northern portion of the Peruvian montaña. The southern half of the *montaña* is watered by streams flowing from the eastern Andes, which go to form the river Madre de Dios or Amaru-mayu, the principal branch of the river Beni, which falls into the Madeira. The region of the Peruvian montaña, which is 800 m. long from the Marañon to the Bolivian frontier, is naturally divided into two sections, the sub-tropical forests in the ravines and on the eastern slopes of the Andes, and the dense tropical forests in the Amazonian plain. The sub-tropical section is important from the value of its products and interesting from the grandeur and beauty of its scenery. Long spurs run off from the Andes, gradually decreasing in elevation, and it is sometimes a distance of 60 or 80 m. before they finally subside into the vast forest-covered plains of the Amazon basin. Numerous rivers flow through the valleys between these spurs, which are the native home of the quinine-yielding cinchona trees. The most valuable species, called *C. Calisaya*, is found in the forests of Caravaya in south Peru and in those of Bolivia. The species between Caravaya and the head-waters of the Huallaga yield very little of the febrifuge alkaloid. But the forests of Huanuco and Huamalios abound in species yielding the grey bark of commerce, which is rich in cinchonine, an alkaloid efficacious as a febrifuge, though inferior to quinine. With the cinchona trees grow many kinds of *melastomaceae*, especially the *Lasiandra*, with masses of purple flowers, tree-ferns and palms. In the warm valleys there are large plantations of coca (*Erythroxylon Coca*), the annual produce of which is stated at 15,000,000 lb. The other products of these warm valleys are excellent coffee, cocoa, sugar, tropical fruits of all kinds, and gold in abundance. In the vast untrodden forests farther east there are timber trees of many kinds, incense trees, a great wealth of rubber trees of the *Hevea* genus, numerous varieties of beautiful palms, sarsaparilla, vanilla, ipecacuanha and copaiba. The abundant and varied fauna is the same as that of the Brazilian forests.

Geology.[1]—The Eastern Cordillera, which, however, is but little known, appears to consist, as in Bolivia, chiefly of Palaeozoic rocks; the western ranges of the Andes are formed of Mesozoic beds, together with recent volcanic lavas and ashes; and the lower hills near the coast are composed of granite, syenite and other crystalline rocks, sometimes accompanied by limestones and sandstones, which are probably of Lower Cretaceous age, and often covered by marine Tertiary deposits. Thus the orographical features of the country correspond broadly with the geological divisions.

The constitution of the Mesozoic band varies. Above Lima the western chain of the Andes is composed of porphyritic tuffs and massive limestones, while the longitudinal valley of the Oroya is hollowed in carbonaceous sandstones. From the analogy of the neighbouring countries it is possible that some of the tuffs may be Jurassic, but the other deposits probably belong for the most part to the Cretaceous system. The carbonaceous sandstone contains Gault fossils. Like the similar sandstone in Bolivia, it includes seams of coal and is frequently impregnated with cinnabar. It is in this sandstone that the rich mercury mines of Huancavelica are worked.

Farther north, in the department of Ancachs, the Mesozoic belt is composed chiefly of sandstones and shales, and the limestones which form so prominent a feature above Lima seem to have disappeared. The Cordillera Negra in this region is in many places cut by numerous dikes of diorite, and it is near these dikes that silver ores are chiefly

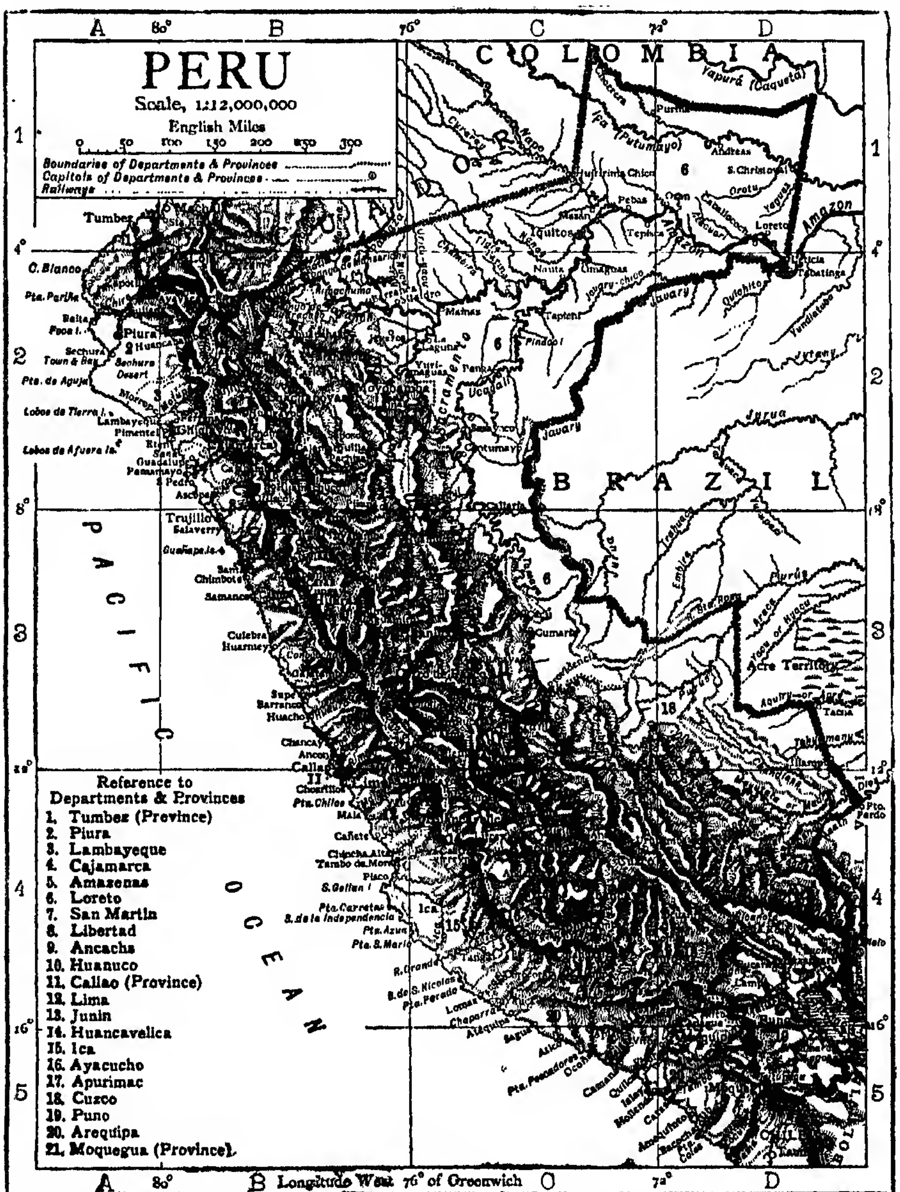
1874, and on the 7th of October 1876 died at Munich while attending the sittings of the historical commission.

The *Monumenta* began to appear in 1826, and at the date of his resignation 24 volumes folio (*Scriptores, Leges, Diplomata*) had appeared. This work for the first time made possible the existence of the modern school of scientific historians of medieval Germany. In connexion with the *Monumenta* Pertz also began the publication of a selection of sources in octavo form, the *Scriptores rerum germanicarum in usum scholarum*; among his other literary labours may be mentioned an edition of the *Gesammelte Werke* of Leibnitz, and a life of Stein (*Leben des Ministers Freiherrn vom Stein* (6 vols., 1849–1855); also, in an abridged form, *Aus Steins Leben* (2 vols., 1856).



PERU (apparently from *Biru*, a small river on the west coast of Colombia, where Pizarro landed), a republic of the Pacific coast of South America, extending in a general N.N.W.–S.S.E. direction from lat. 3° 21′ S. to about 18° S., with a sea-coast of 1240 m. and a width of 300 to 400 m., exclusive of territories in dispute. Its area in 1906, including Tacna and Arica, and other disputed territories occupied by neighbouring states, was officially estimated at 1,752,422 sq. kilometers, or 676,638 sq. m.; exclusive of these territories, the area of Peru is variously estimated at 439,000 to 480,000 sq. m., the Gotha measurements being 1,137,000 sq. kilometers, or 439,014 sq. m.

With the exception of parts of the Ecuador, Brazil and Bolivia frontiers, all the boundary lines have been disputed and referred to arbitration—those with Colombia and Ecuador to the king of Spain, and that with Bolivia to the president of Argentina, on which a decision was rendered on the 9th of July 1909. There have been misunderstandings with Ecuador in regard to some small areas in the Chira valley, but it may be assumed that the line is fixed between Santa Rosa (3° 21′ S.) on the Gulf of Guayaquil, and the Chinchipe river, a tributary of the Marañon. At the junction of the Cauches with that river, the Ecuadorean line descends the Chinchipe to the Marañon, and the Peruvian ascends to a point where it is intersected by a line following the eastern Cordillera northward to the headwaters of the Caquetá, or Japurá, which forms the northern boundary down to the Brazilian frontier. This claim covers all eastern Ecuador and a large part of south-eastern Colombia. In 1903 there were encounters between small bodies of Peruvian and Ecuadorean troops on the disputed frontier. After arbitration by the king of Spain had been agreed upon, the question was considered by two Spanish commissions, and modifications favouring Peru were recommended. These became known prematurely, and in May 1910 war was threatened between Peru and Ecuador in spite of an offer of mediation by the United States, Brazil and Argentina under the Hague Convention.

From the Japurá southward to the Amazon, in 4° 13′ 21″ S., 69° 35′ W., and thence up the Javary, or Yavari, to its source in 7° 8′ 4″ S., 73° 46′ 30″ W., as determined by a mixed commission, the line has been definitely settled. From near the source of the Javary, or lat. 7° 1′ 17″ S., a line running eastward to the Madeira in lat. 6° 52′ 15″ S., which is half the distance between the mouth of the Mamoré and the mouth of the Madeira, divides the Spanish and Portuguese possessions in this part of South America, according to the provisions of the Treaty of San Ildefonso of 1777. This line has been twice modified by treaties between Bolivia and Brazil, but without the consent of Peru, which claimed all the territory eastward to the Madeira between the above-mentioned line and the Beni-Madidi rivers, the line of demarcation following the Pablo-bamba, a small tributary of the Madidi, to its source, and thence in a straight line to the village of Conima, on Lake Titicaca. The dispute with Brazil relates to the territory acquired by that republic from Bolivia in 1867 and 1903, and was to be settled, according to an agreement

A list of Peruvian authors in viceregal times occupies a long chapter in the life of St Toribio[1] by Montalvo; and the bibliographical labours of the Peruvian Leon Pinelo are still invaluable to Spanish students. The most prolific author of colonial times was Dr Pedro de Peralta y Barnuevo, who wrote more than sixty works, including an epic poem entitled *Lima fundada*.

The topographical labours of Cosmo Bueno and Unanue were ably continued at Lima by Admiral Don Eduardo Carrasco, who compiled annual guides of Peru from 1826. But the most eminent Peruvian geographer is Dr Don Mariano Felipe Paz Soldan (1821–1886), whose *Geografia del Peru* appeared in 1861. His still more important work, the *Diccionario geografico estadistico del Peru* (1877), is a gazetteer on a most complete scale. In 1868 appeared his first volume of the *Historia del Peru independiente*, and two others have since been published. His *Historia de la guerra del Pacifico* is the Peruvian version of that disastrous war. The earlier history of Peru has been written in three volumes by Sebastian Lorente (d. 1884); Mariano Rivero has discussed its antiquities; and Manuel Fuentes has edited six volumes of memoirs written by Spanish viceroys. But the most valuable and important historical work by a modern Peruvian is General Mendiburu's (1805–1885) *Diccionario historico-biografico del Peru*, a monument of patient and conscientious research, combined with critical discernment of a high order. As laborious historical students, Don José Toribio Polo, the author of an ecclesiastical history of Peruvian dioceses, and Don Enrique Torres Saldamando, the historian of the Jesuits in Peru, have great merit. Among good local annalists may be mentioned Juan Gilberto Valdivia, who has written a history of Arequipa, and Pio Benigno Mesa, the author of the *Annals of Cuzco*.

The leading Peruvian authors on constitutional and legal subjects are Dr José Santistevan, who has published volumes on civil and criminal law; Luis Felipe Villaran (subsequently rector of the university at Lima), author of a work on constitutional right; Dr Francisco Garcia Calderon (once president of Peru), author of a dictionary of Peruvian legislation, in two volumes; Dr Francisco Xavier Mariategui, one of the fathers of Peruvian independence; and Dr Francisco de Paula Vigil (1792–1875), orator and statesman as well as author, whose work, *Defensa de los gobiernos*, is a noble and enlightened statement of the case for civil governments against the pretensions of the court of Rome. Manuel A. Fuentes, an able statistician and the author of the *Estadistica de Lima*, has also written a manual of parliamentary practice. Perhaps the most important work on Peru of modern times is that of the Italian savant Antonio Raimondi (1825–1890), who spent the greater part of his life in studying the topography and natural resources of the country. Only four volumes had been published at the time of his death, but he left a mass of papers and manuscripts which the government has put in the hands of the Geographical Society of Lima for publication. His great work is entitled *El Peru: estudios mineralogicos*, &c. (3 vols., Lima, 1890–1902), and one separate volume on the department of Ancachs. Peruvian literature since the independence has also attained high merit in the walks of poetry and romance. The Guayaquil author, Olmedo, who wrote the famous ode on the victory of Junin, and the Limenians Felipe Pardo and Manuel Segura are names well known wherever the Spanish language is spoken. Both died between 1860 and 1870. The comedies of Segura on the customs of Lima society, entitled *Un Paseo a Amancaes* and *La Saya y Manto*, have no equal in the dramatic literature of Spanish America and few in that of modern Spain. From 1848 date the first poetical efforts of Arnaldo Marquez, who is distinguished for his correct diction and rich imagination, as is Nicolas Corpancho for his dramas and a volume of poems entitled *Brisas*, Adolfo Garcia for a beautiful sonnet to Bolivar, which was published at Havre in 1870, in his one volume of poems, and Clemente Althaus for his productivity and style. Pedro Paz Soldan was a classical scholar who published three volumes of poems. Carlos Augusto Salaverry is known as one of Peru's best lyrical poets, and Luis Benjamin Cisneros for his two novels, *Julia* and *Edgardo*. Trinidad Fernandez and Constantino Carrasco were two poets of merit who died young, the principal work of the latter being his metrical version of the Quichua drama, *Ollantay*. José Antonio Lavalle and Narciso Arestegui are chiefly known as novelists. In his youth Ricardo Palma published three books of poems, entitled *Armonias*, *Verbos y Gerundios* and *Pasionarias*, and then, since 1870, devoted his great literary talents to writing the historical traditions of Peru, of which six volumes were published. At the outbreak of the war with Chile he was vice-director of the national library at Lima, which was wantonly pillaged by the Chilean forces. After the evacuation of Lima by the Chileans Palma devoted his life to the recovery of his scattered books and the acquisition of new collections, and he had the satisfaction before his death of re-opening the library, which had obtained about 30,000 volumes, or three-fourths of the number on its shelves before the Chilean invasion.

Of the aboriginal inhabitants of Peru much has been written. The important work of Mariano Eduardo Rivero, of Arequipa, assisted by J. J. von Tschudi, on the antiquities of Peru (*Antiguedades peruanas*, Vienna, 1841; Eng. trans., New York, 1853) has been followed by other investigators into the language, literature, customs and religion of the Incas. The best known of these are José Sebastián Barranca, the naturalist and antiquary, José Fernandez Nodal, and Gavino Pacheco Zegarra of Cuzco, who published translations of the Inca drama of *Ollantay*, and Leonardo Villar, of Cuzco.

Among Peruvian naturalists since the advent of the republic, the most distinguished have been Mariano Eduardo Rivero, the geologist, mineralogist and archaeologist, and his friend and colleague Nicolas de Pierola, authors of *Memorial de ciencias naturales*. The Lima Geographical Society (founded in 1888) is perhaps the best and most active scientific organization in the republic. Its special work covers national geographical exploration and study, archaeology, statistics and climatology, and its quarterly bulletins contain invaluable information. The society receives a government subsidy, and its rooms in the national library in Lima are the principal centre of scientific study in Peru. It had an active membership of 163 in 1906, besides 172 honorary and corresponding members. The historical institute of Peru, also at Lima, is charged by the government, from which it receives a liberal subsidy, with the work of collecting, preparing and publishing documents relating to Peruvian history, and of preserving objects of archaeological and historic character. Its museum, which is of great historical and artistic value and includes a collection of portraits of the Peruvian viceroys and presidents, is in the upper floors of the Exposition Palace. Another subsidized national society is the Athenæum, which was founded in 1877 as the "literary club," and reorganized in 1887 under its present title. Its purpose is to foster learning and literary effort, and it is a popular and prominent feature in the intellectual life of the country.

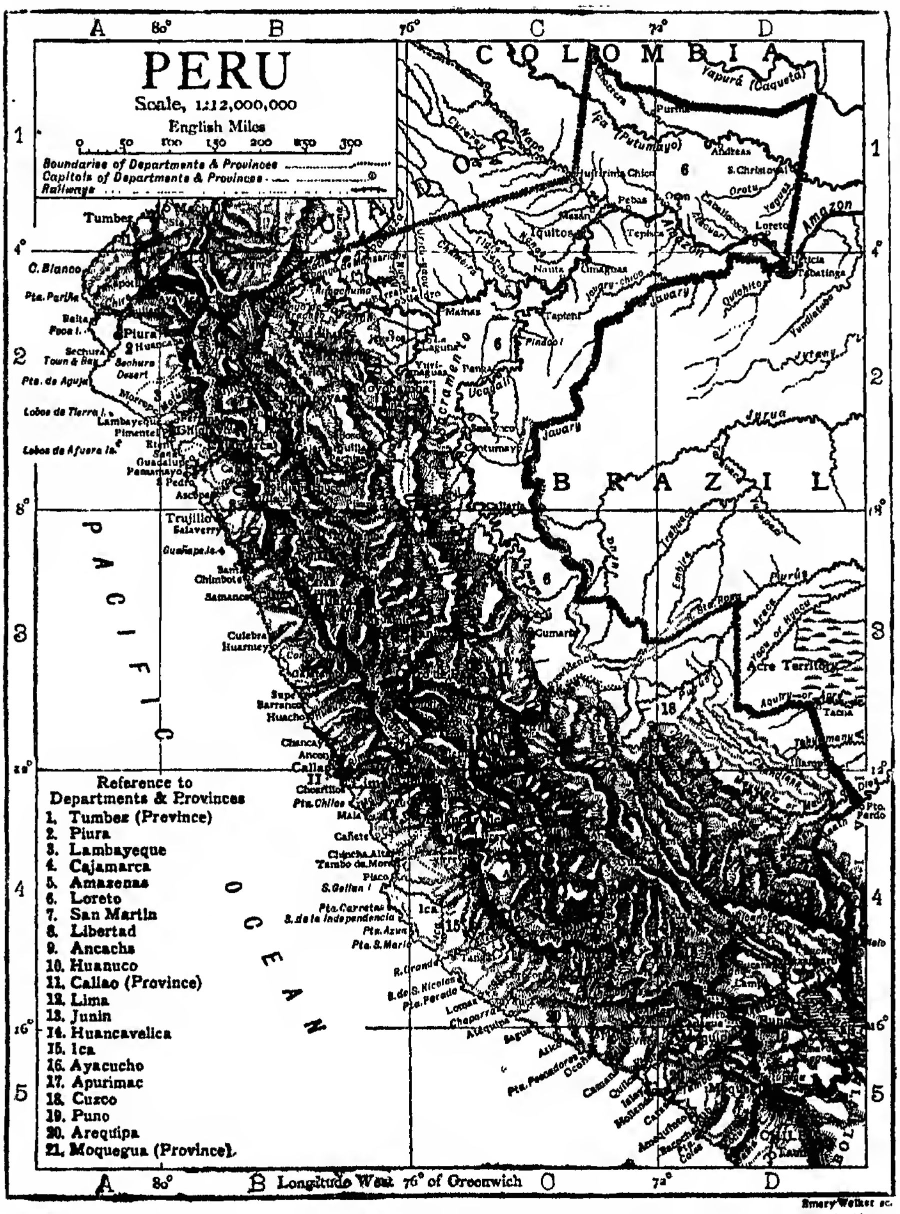
Religion.—According to the constitution of 1860 "the nation professes the apostolic Roman Catholic religion; the state protects it, and does not permit the public exercise of any other." There is a certain degree of tolerance, however, and the Anglican and some of the Evangelical Churches are permitted to establish missions in the country, but not always without hostile demonstrations from the Catholic priesthood. There are Anglican churches in Lima and Cuzco, belonging to the diocese of the Bishop of the Falkland Islands; but their existence is illegal and is ignored rather than permitted. In its ecclesiastical organization Peru is divided into nine dioceses: Lima, which is an archbishopric, Arequipa, Puno, Cuzco, Ayacucho, Huanuco, Huaraz, Trujillo and Chachapoyas. These dioceses are subdivided into 613 curacies, presided over by *curas*, or curate-vicars. Each diocese has its seminary for the education of the priesthood, that of Arequipa being distinguished for its influence in church affairs. Arequipa, like Cordoba and Chuquisaca, is a stronghold of clericalism and exercises a decisive influence in politics as well as in church matters. There are a number of fine churches in Lima and in the sees of the various dioceses. Monasteries and nunneries are numerous, dating back to the 16th and 17th centuries, but their influence is now less potent than in those days and the monastic population is not so large. In modern times many of the convents have been devoted to educational work especially for girls, which is an obstacle to the successful development of a public school system in the country.

Political Divisions.—The empire of the Incas was divided into four main divisions, Chinchay-suyu to the north of Cuzco, Anti-suyu to the east, Colla-suyu to the south and Cunti-suyu to the west, the whole empire being called Ttahuantin-suyu, or the four governments. Each was ruled by a viceroy, under whom were the "huaranca-camayocs," or officers ruling over thousands, and inferior officers, in regular order, over 500, 100 50 and 10 men. All disorders and irregularities were checked by the periodical visits of the *tucuyricocs* or inspectors. The Spanish conquest destroyed this complicated system. In 1569 the governor, Lope Garcia de Castro, divided Peru into *corregimientos* under officers named *corregidors*, of whom there were 77, each in direct communication with the government at Lima. An important administrative reform was made in 1784, when Peru was divided into 7 *intendencias*, each under an officer called an *intendente*. These *intendencias* included about 6 of the old *corregimientos*, which were called *partidos*, under officers named *subdelegados*. Thus the number of officers reporting direct to Lima was reduced from 77 to 7, a great improvement. The republic adopted the same system, calling the *intendencias* departments, under a prefect, and the *partidos* provinces, under a sub-prefect. Peru is divided into 18 departments, 2 littoral provinces, and what is called the constitutional province of Callao. This is exclusive of Tacna and its 3 provinces. The departments, which contain 98 provinces, with their areas, capitals and estimated populations of 1906, are as follow: the

[1] The city of Lima produced two saints, the archbishop St Toribio, who flourished from 1578 to 1606, and Santa Rosa, the patron saint of the city of the kings (1586–1616), whose festival is celebrated on the 26th of August.

1874, and on the 7th of October 1876 died at Munich while attending the sittings of the historical commission.

The *Monumenta* began to appear in 1826, and at the date of his resignation 24 volumes folio (*Scriptores, Leges, Diplomata*) had appeared. This work for the first time made possible the existence of the modern school of scientific historians of medieval Germany. In connexion with the *Monumenta* Pertz also began the publication of a selection of sources in octavo form, the *Scriptores rerum germanicarum in usum scholarum*; among his other literary labours may be mentioned an edition of the *Gesammelte Werke* of Leibnitz, and a life of Stein (*Leben des Ministers Freiherrn vom Stein* (6 vols., 1849–1855); also, in an abridged form, *Aus Steins Leben* (2 vols., 1856).



PERU (apparently from *Biru*, a small river on the west coast of Colombia, where Pizarro landed), a republic of the Pacific coast of South America, extending in a general N.N.W.-S.S.E. direction from lat. 3° 21′ S. to about 18° S., with a sea-coast of 1240 m. and a width of 300 to 400 m., exclusive of territories in dispute. Its area in 1906, including Tacna and Arica, and other disputed territories occupied by neighbouring states, was officially estimated at 1,752,422 sq. kilometers, or 676,638 sq. m.; exclusive of these territories, the area of Peru is variously estimated at 439,000 to 480,000 sq. m., the Gotha measurements being 1,137,000 sq. kilometers, or 439,014 sq. m.

With the exception of parts of the Ecuador, Brazil and Bolivia frontiers, all the boundary lines have been disputed and referred to arbitration—those with Colombia and Ecuador to the king of Spain, and that with Bolivia to the president of Argentina, on which a decision was rendered on the 9th of July 1909. There have been misunderstandings with Ecuador in regard to some small areas in the Chira valley, but it may be assumed that the line is fixed between Santa Rosa (3° 21′ S.) on the Gulf of Guayaquil, and the Chinchipe river, a tributary of the Marañon. At the junction of the Cauches with that river, the Ecuadorean line descends the Chinchipe to the Marañon, and the Peruvian ascends to a point where it is intersected by a line following the eastern Cordillera northward to the headwaters of the Caquetá, or Japurá, which forms the northern boundary down to the Brazilian frontier. This claim covers all eastern Ecuador and a large part of south-eastern Colombia. In 1903 there were encounters between small bodies of Peruvian and Ecuadorean troops on the disputed frontier. After arbitration by the king of Spain had been agreed upon, the question was considered by two Spanish commissions, and modifications favouring Peru were recommended. These became known prematurely, and in May 1910 war was threatened between Peru and Ecuador in spite of an offer of mediation by the United States, Brazil and Argentina under the Hague Convention.

From the Japurá southward to the Amazon, in 4° 13′ 21″ S., 69° 35′ W., and thence up the Javary, or Yavari, to its source in 7° 8′ 4″ S., 73° 46′ 30″ W., as determined by a mixed commission, the line has been definitely settled. From near the source of the Javary, or lat. 7° 1′ 17″ S., a line running eastward to the Madeira in lat. 6° 52′ 15″ S., which is half the distance between the mouth of the Mamoré and the mouth of the Madeira, divides the Spanish and Portuguese possessions in this part of South America, according to the provisions of the Treaty of San Ildefonso of 1777. This line has been twice modified by treaties between Bolivia and Brazil, but without the consent of Peru, which claimed all the territory eastward to the Madeira between the above-mentioned line and the Beni-Madidi rivers, the line of demarcation following the Pablo-bamba, a small tributary of the Madidi, to its source, and thence in a straight line to the village of Conima, on Lake Titicaca. The dispute with Brazil relates to the territory acquired by that republic from Bolivia in 1867 and 1903, and was to be settled, according to an agreement

capital. The second-class ports are Tumbez, Talara, Pimentel, Chimbote, Samanco, Casma, Huacho, Cerro-Azul, Tambo de Mora, Lomas and Chala, on the coast, Puno on Lake Titicaca, and Leticia on the Amazon near the western mouth of the Javary. Callao (*q.v.*) is the chief port of the republic and monopolizes the greater part of its foreign trade. Its harbour, one of the best on the west coast of South America, has been greatly improved by the port works begun under the administration of President Balta. Paita and Chimbote have good natural harbours, but the others, for the most part, are open roadsteads or unsheltered bays. Mollendo is a shipping port for Bolivian exports sent over the railway from Puno. There were 12 foreign steamship lines trading at Peruvian ports in 1908, some of them making regular trips up and down the coast at frequent intervals and carrying much of its coastwise traffic. Foreign sailing vessels since 1886 have not been permitted to engage in this traffic, but permission is given to steamships on application and under certain conditions. The imports were valued in 1907 at 55,147,870 *soles* (10 soles = £1 stg.) and the exports at 57,477,320 *soles*—the former showing a considerable increase and the latter a small decrease in comparison with 1906. The exports consist of cotton, sugar, cocaine, hides and skins, rubber and other forest products, wool, guano and mineral products. The most important export is sugar, the products of the mines ranking second. The largest share in Peru's foreign trade is taken by Great Britain, Chile ranking second and the United States third.

Products.—Although her mining industries have been the longest and most widely known, the principal source of Peru's wealth is agriculture. This seems incompatible with the arid character of the country and the peculiar conditions of its civilization, but irrigation has been successfully employed in the fertile valleys of the coast.

Agriculture.—Sugar-cane is cultivated in most of the coast valleys, and with exceptional success in those of the Cañete, Rimac, Chancay, Huaura, Supe, Santa, Chicama, Pacasmayo and Chiclayo. Some of the large estates are owned and worked by British subjects. The industry was nearly ruined by the Chileans in 1880, but its recovery soon followed the termination of the war and the output has been steadily increasing. At the outbreak of the war the production was about 80,000 tons; in 1905 the production of sugar and molasses amounted to 161,851 metric tons, of which 134,344 were exported. In 1906 the total production reached 169,418 metric tons. Next in importance is cotton, which is grown along the greater part of the Peruvian coast, but chiefly in the departments of Piura, Lima and Ica. Four kinds are produced: rough cotton or "vegetable wool," sea island, brown or Mitafifi, and smooth or American. Production is steadily increasing, the export having been 8000 metric tons in 1900, 17,386 in 1905 and 20,000 in 1906. Local consumption required about 2500 tons in 1905. Rice is an important crop in the inundated lands of Lambayeque and Libertad. It is a universal article of food in Peru, and the output is consumed in the country. Maize is another important food product, which is generally cultivated along the coast and in the lower valleys of the sierra. In some places two or three crops a year are obtained. It is the staple food everywhere, and little is exported. It is largely used in the manufacture of *chicha*, a fermented drink popular among the lower classes. Tobacco is grown in the department of Piura, and in the *montaña* departments of Loreto, Amazonas and Cajamarca. The local consumption is large and the export small. Another *montaña* product is coffee, whose successful development is prevented by difficult transport. A superior quality of bean is produced in the eastern valleys of the Andes, especially in the Chanchamayo valley. Cacao is another *montaña* product, although like coffee it is cultivated in the warm valleys of the sierra, but the export is small. With cheap transport to the coast the production of coffee and cacao must largely increase. Coca (*Erythroxylon coca*) is a product peculiar to the eastern Andean slopes of Bolivia and Peru, where it has long been cultivated for its leaves. These are sun-dried, packed in bales, and distributed throughout the *sierra* region, where coca is used by the natives as a stimulant. The *cholos* are never without it, and with it are able to perform incredible tasks with little food. The common manner of using it is to masticate the dried leaves with a little lime. Cocaine is also derived from coca leaves, and a considerable quantity of the drug is exported. The coca shrub is most successfully cultivated at an elevation of 5000 to 6000 ft. Fruits in great variety are grown everywhere in Peru, but beyond local market demands their commercial production is limited to grapes and olives. Grapes are produced in many of the irrigated valleys of the coast, such as Chincha, Lunahuana, Ica, Vitor, Majes, Andaray, Moquegua and Locumba, and the fruit is manufactured into wines and brandies. Excellent clarets and white wines are produced, and the industry is steadily increasing. Olives were introduced early in colonial times and are cultivated in several coast valleys, especially in the provinces of Camaná (Arequipa) and Moquegua. The fruit is commonly used for the manufacture of oil, which is consumed in the country, and only a small part is exported. Were large markets available, other fruits such as oranges, lemons, limes and bananas would undoubtedly be extensively cultivated. In the *sierra* region, wheat, barley, oats, quinua (*Chenopodium quinoa*), alfalfa, Indian corn, oca (*Oxalis tuberosa*) and potatoes are the principal products. Wheat is widely grown, but the output is not large. Barley and oats are grown for forage, but for this purpose alfalfa has become the staple, and without it the mountain pack-trains could not be maintained. Quinua is an indigenous plant, growing at elevations of 13,500 ft. and more; its grain is an important food among the upland natives. Potatoes are grown everywhere in the sierras, and with quinua are the only crops that can be raised for human food above 13,000 ft. *Yuca* (*Manihot utilissima*), known as *cassava* in the West Indies and *mandioca* in Brazil, is also widely cultivated for food and for the manufacture of starch.

Livestock.

There are good pastures in the sierras, and cattle have been successfully reared in some of the departments since the early years of Spanish occupation, chiefly in Ancachs, Cajamarca, Junin, Ayacucho, Puno, and some parts of Cuzco. The development of alfalfa cultivation is extending the area of cattle-breeding somewhat and is improving the quality of the beef produced. The cattle are commonly small and hardy, and, like the Mexican cattle, are able to bear unfavourable conditions. Sheep are reared over a somewhat wider range, exclusively for their wool. The "natives," or descendants of the early importations, are small, long-legged animals whose wool is scanty and poor. Since the end of the 19th century efforts have been made to improve the stock through the importation of merinos, with good results. Sheep ranges under the care of Scottish shepherds have also been established in the department of Junin, the stock being imported from southern Patagonia, England and Australia. Goats are raised in Piura and Lamhayeque for their skins and fat, and swine-breeding for the production of lard has become important in some of the coast valleys immediately north of Lima. Horses are reared only to a limited extent, although there is a demand for them for military purposes. The government is seeking to promote the industry through the importation of breeding mares from Argentina. Mules are bred in Piura and Apurimac, and are highly esteemed for mountain travel. The chief breeding industry is that of the llama, alpaca and vicuña—animals of the *Auchenia* family domesticated by the Indians and bred, the first as a pack animal, and the other two for their wool, hides and meat. The llama was the only beast of burden known to the South American natives before the arrival of the Spaniards and is highly serviceable on the difficult trails of the Andes. The alpaca and vicuña are smaller and weaker and have never been used for this service, but their fine, glossy fleeces were used by the Indians in the manufacture of clothing and are still an important commercial asset of the elevated table-lands of Peru and Bolivia. The export of wool in 1905 exceeded 3,300,000 lb. The rearing of these animals requires much patience and skill, in which no one has been able to match the Indian breeders of the Andean plateaus.

Forest Products.

The natural products of Peru include rubber, cabinet woods in great variety, cinchona or Peruvian bark and other medicinal products, various fibres, and guano. There are two kinds of rubber supplied by the Peruvian *montaña* forests: *jebe* (also written *hebe*) or *seringa*, and *caucho*—the former being collected from the *Hevea guayanensis*, or *H. brasiliensis*, and the latter from the *Castilloa elastica* and some other varieties. The *Hevea* product is obtained annually by tapping the trees and coagulating the sap over a smoky fire, but the *caucho* is procured by felling the tree and collecting the sap in a hollow in the ground where it is coagulated by stirring in a mixture of soap and the juice of a plant called *vetilla*. As the species from which Ceará rubber is obtained (*Hancornia speciosa*) is found in Bolivia, it is probable that this is also a source of the Peruvian *caucho*. The *Hevea* is found along the water-courses of the lowlands, which includes the large tributaries of the Marañon, while the *caucho* species flourish on higher ground, above 900 ft. elevation. Owing to the export tax on rubber (8 cents per kilogram on *jebe* and 5 cents on *caucho*) it is probable that the official statistics do not cover the total production, which was returned as 2539 metric tons in 1905, valued at £913,989. The export of cinchona, or Peruvian bark, is not important in itself, being only 64 tons, valued at £1406 in 1905. The best bark comes from the Carabaya district in south-eastern Peru, but it is found in many localities on the eastern slopes of the Andes. The Peruvian supply is practically exhausted through the destructive methods employed in collecting the bark, and the world now depends chiefly on Bolivia and Ecuador. The forests of eastern Peru are rich in fine cabinet woods, but their inaccessibility renders them of no great value. Among the best known of them are cedar, walnut, ironwood and caoba, a kind of mahogany. Many of the forest trees of the upper Amazon valley of Brazil are likewise found in Peru. The palm family is numerous and includes the species producing vegetable ivory (*Phytelephas*), straw for plaiting Panama hats (*Carludovica palmata*), and the peach palm (*Guilielma speciosa*).

Guano.

From guano an immense revenue was derived during the third quarter of the 19th century and it is still one of the largest exports. The guano beds are found on the barren islands of the Pacific coast. They were developed commercially during the administration (1845–1851) of President Ramon Castilla, at the same time that the nitrate deposits of Tarapacá became a

commercial asset of the republic. The large revenues derived from these sources undoubtedly became a cause of weakness and demoralization and eventually resulted in bankruptcy and the loss of Tarapacá. The deposits have been partially exhausted by the large shipments of over a half-century, but the export in 1905 was 73,369 tons, valued at £285,729.

Mining.—Mining was the chief industry of Peru under Spanish rule. The Inca tribes were an agricultural and pastoral people, but the abundance of gold and silver in their possession at the time of the conquest shows that mining must have received considerable attention. They used these precious metals in decorations and as ornaments, but apparently attached no great value to them. The use of bronze also shows that they must have worked, perhaps superficially, some of the great copper deposits. Immediately following the Spanish invasion the Andean region was thoroughly explored, and with the assistance of Indian slaves thousands of mines were opened—many of them failures, some of them becoming famous. There was a decline in mining enterprise after the revolt of the colonists against Spanish rule, owing to the unsettled state of the country, and this decline continued in some measure to the end of the century. The mining laws of the colonial régime and political disorder together raised a barrier to the employment of the large amount of capital needed, while the frequent outbreaks of civil war made it impossible to work any large enterprise because of its interference with labour and the free use of ports and roads. The Peruvians were impoverished, and under such conditions foreign capital could not be secured. In 1876 new mining laws were enacted which gave better titles to mining properties and better regulations for their operation, but the outbreak of the war with Chile at the end of the decade and the succeeding years of disorganization and partisan strife defeated their purpose. Another new mining code was adopted in 1901, and this, with an improvement in political and economic conditions, has led to a renewal of mining enterprise.

Practically the whole Andean region of Peru is mineral-bearing—a region 1500 m. long by 200 to 300 m. wide. Within these limits are to be found most of the minerals known—gold, silver, quicksilver, copper, lead, zinc, iron, manganese, wolfram, bismuth, thorium, vanadium, mica, coal, &c. On or near the coast are coal, salt, sulphur, borax, nitrates and petroleum. Gold is found in lodes and alluvial deposit; the former on the Pacific slope at Salpo, Otuzco, Huaylas, Yungay, Ocros, Chorrillos, Cañete, Ica, Nasca, Andaray and Arequipa, and on the table-lands and Amazon slope at Pataz, Huánuco, Chuquitambo, Huancavelica, Cuzco, Cotabambas, Aymares, Paucartambo, Santo Domingo and Sandia; the latter wholly on the Amazon slope, in the country about the Pongo de Manseriche and at Chuquibamba, both on the upper Marañon, in the districts of Pataz, Huánuco, Aymares and Antabamba (Apurimac), Paucartambo and Quippicauchi (Cuzco), and Sandia and Carabaya (Puno). The last two are most important and, it is believed, were the sources from which the Incas derived the greater part of their store. The alluvial deposits are found both in the beds of the small streams and in the soil of the small plains or *pampas*. The Aporoma deposit, in the district of Sandia, is the best known. Long ditches with stone-paved sluices for washing this mineral-bearing material have long been used by the Indians, who also construct stone bars across the beds of the streams to make riffles and hold the deposited grains of gold. Modern methods of hydraulic mining have been introduced to work the auriferous banks of Poto; elsewhere antiquated methods only are employed. The upper valley of the Marañon has undeveloped gold-bearing lodes. The number of mines worked is small and there is not much foreign capital invested in them. The gold ores of Peru are usually found in ferruginous quartz. The production in 1906 was valued at £170,355.

Peru has been known chiefly for its silver mines, some of which have been marvellously productive. The Cerro de Pasco district, with its 342 mines, is credited with a production, in value, of £40,000,000 between 1784 and 1889, and is still productive, the output for 1906 being valued at £972,958. The principal silver-producing districts, the greater part on the high table-lands and slopes of the Andes, are those of Salpo, Hualgayoc, Huari, Huallanca, Huaylas, Huaraz, Recuay, Cajatambo, Yauli, Cerro de Pasco, Morococha, Huarochiri, Huancavelica, Quespisisa, Castrovirreyna, Lucanas, Lampa, Caylloma and Puno, but there are hundreds of others outside their limits. Silver is generally found as red oxides (locally called *rosicler*), sulphides and argentiferous galena. Modern machinery is little used and many mines are practically unworkable for want of pumps. In the vicinity of some of the deposits of argentiferous galena are large coal beds, but timber is scarce on the table-lands. The dried dung of the llama (*taquia*) is generally used as fuel, as in pre-Spanish times, for roasting ores, as also a species of grass called *ichu* (*Stipa incana*), and a singular woody fungus, called *yareta* (*Azorella umbellifera*), found growing on the rocks at elevations exceeding 12,000 ft. The methods formerly employed in reducing ores were lixiviation and amalgamation with quicksilver, but modern methods are gradually coming into use. Quicksilver is found at Huancavelica, Chonta (Ancachs), and in the department of Puno. The mine first named has been worked since 1566 and its total production is estimated at 60,000 tons, the annual product being about 670 tons for a long period. The metal generally occurs as sulphide of mercury (cinnabar), but the ores vary greatly in richness—from 2½ to 20 %. The annual production has fallen to a small fraction of the former output, its value in 1905 being only £340, and in 1906 £495.

The copper deposits of Peru long remained undeveloped through want of cheap transport and failure to appreciate their true value. The principal copper-bearing districts are Chimbote, Cajamarca, Huancayo, Huaraz, Huallanca, Junin, Huancavelica, Ica, Arequipa, Andahuaylas and Cuzco—chiefly situated in the high, bleak regions of the Andes. The Junin district is the best known and includes the Cerro de Pasco, Yauli, Morococha and Huallay groups of mines, all finding an outlet to the coast over the Oroya railway. These mines are of recent development, the Cerro de Pasco mines having been purchased by American capitalists. A smelting plant was erected in the vicinity of Cerro de Pasco designed to treat 1000 tons of ore daily, a railway was built to Oroya to connect with the state line terminating at that point, and a branch line 62 m. long was built to the coal-mines of Goillarisquisga. The Cerro de Pasco mines are supposed by some authorities to be the largest copper deposit in the world. In addition to the smelting works at Cerro de Pasco there are other large works at Casapalca, between Oroya and Lima, which belong to a British company, and smaller plants at Huallanca and Huinac. The production of copper is steadily increasing, the returns for 1903 being 9497 tons, and for 1906, 13,474 tons, valued respectively at £476,824 and £996,055. Of other metals, lead is widely distributed, its chief source being a high-grade galena accompanied by silver. Iron ores are found in Piura, the Huaylas valley, Aya, and some other places, but the deposits have not been worked through lack of fuel. Sulphur deposits exist in the Sechura desert region, on the coast, and extensive borax deposits have been developed in the department of Arequipa. Coal has been found in extensive beds near Piura, Salaverry, Chimbote, Huarmey and Pisco on the coast, and at Goillarisquisga, Huarochiri and other places in the interior. Both anthracite and bituminous deposits have been found. Most of the deposits are isolated and have not been developed for want of transport. Petroleum has been found at several points on the coast in the department of Piura, and near Lake Titicaca in the department of Puno. The most productive of the Piura wells are at Talara and Zorritos, where refineries have been established. The crude oil is used on some of the Peruvian railways.

The number of mining claims (*pertenencias*) registered in 1907 was 12,858, according to official returns, each subject to a tax of 30 soles, or £3, per annum, the payment of which secures complete ownership of the property. The claims measure 100 × 200 metres (about 5 acres) in the case of mineral veins or lodes, and 200 × 200 metres (about 10 acres) for coal, alluvial gold and other deposits. The labourers are commonly obtained from the *cholos*, or Indian inhabitants of the sierras, who are accustomed to high altitudes, and are generally efficient and trustworthy.

Manufactures.—The manufacturing industries of Peru are confined chiefly to the treatment of agricultural and mineral products—the manufacture of sugar and rum from sugar-cane, textiles from cotton and wool, wine and spirits from grapes, cigars and cigarettes from tobacco, chocolate from cacao, kerosene and benzine from crude petroleum, cocaine from coca, and refined metals from their ores. Many of the manufacturing industries are carried on with difficulty and maintained only by protective duties on competing goods. The Incas had made much progress in weaving, and specimens of their fabrics, both plain and coloured, are to be found in many museums. The Spanish introduced their own methods, and their primitive looms are still to be found among the Indians of the interior who weave the coarse material from which their own garments are made. Modern looms for the manufacture of woollens were introduced in 1861 and of cotton goods in 1874. There are large woollen factories at Cuzco and Lima, the Santa Catalina factory at the latter place turning out cloth and cashmere for the army, blankets, counterpanes, and underclothing. There are cotton factories about Lima, at Ica and at Arequipa. Besides the wine industry, an irregular though important industry is the manufacture of artificial or counterfeit spirits and liqueurs in Callao and Lima. There are breweries in Arequipa, Callao, Cuzco and Lima, and the consumption of beer is increasing. There are large cigarette factories in Lima, and others in Arequipa, Callao, Piura and Trujillo. The plaiting of Panama hats from the specially prepared fibre of the "toquilla" palm is a domestic industry among the Indians at Catacoas (Piura) and Eten (Lambayeque). Coarser straw hats are made at other places, as well as hammocks, baskets, &c.

Government.—Peru is a centralized republic, whose supreme law is the constitution of 1860. Like the other states of South America its constitution provides for popular control of legislation and the execution of the laws through free elections and comparatively short terms of office, but in practice these safeguards are often set aside and dictatorial methods supersede all others. Nominally the people are free and exercise

sovereign rights in the choice of their representatives, but the ignorance of the masses, their apathy, poverty and dependence upon the great land proprietors and industrial corporations practically defeat these fundamental constitutional provisions. Citizenship is accorded to all Peruvians over the age of 21 and to all married men under that age, and the right of suffrage to all citizens who can read and write, or possess real estate or workshops, or pay taxes. In all cases the exercise of citizenship is regulated by law.

The government is divided into three independent branches, legislative, executive and judicial, of which through force of circumstances the executive has become the dominating power. The executive branch consists of a president and two vice-presidents elected for terms of four years, a cabinet of six ministers of state appointed by the president, and various subordinate officials who are under the direct orders of the president. The president is chosen by a direct popular election and cannot be re-elected to succeed himself. He must be not less than 35 years of age, a Peruvian by birth, in the enjoyment of all his civil rights, and domiciled in the republic ten years preceding the election. The immediate supervision and despatch of public administrative affairs is in the hands of the cabinet ministers—interior, foreign affairs, war and marine, finance and commerce, justice and public instruction, and public works and promotion (*fomento*). The execution of the laws in the departments and provinces, as well as the maintenance of public order, is entrusted to prefects and sub-prefects, who are appointees of the president. A vacancy in the office of president is filled by one of the two vice-presidents elected at the same time and under the same conditions. Inability of the first vice-president to assume the office opens the way for the second vice-president, who becomes acting president until a successor is chosen. The vice-presidents cannot be candidates for the presidency during their occupancy of the supreme executive office, nor can the ministers of state, nor the general-in-chief of the army, while in the exercise of their official duties.

The legislative power is exercised by a national Congress—senate and chamber of deputies—meeting annually on the 28th of July in ordinary session for a period of 90 days. Senators and deputies are inviolable in the exercise of their duties, and cannot be arrested or imp isoned during a session of Congress, including the month preceding and following the session, except *in flagrante delicto*. Members of Congress are forbidden to accept any employment or benefit from the executive. Senators and deputies are elected by direct vote—the former by departments, and the latter in proportion to the population. With both are elected an equal number of substitutes, who assume office in case of vacancy.

Departments with eight and more provinces are entitled to four senators, those of four to seven provinces three senators, those of two to three provinces two senators, and those of one province one senator. The deputies are chosen to represent 15,000 to 30,000 population each, but every province must have at least one deputy. Both senators and deputies are elected for terms of six years, and both must be native-born Peruvian citizens in the full enjoyment of their civil rights. A senator must be 35 years of age, and have a yearly income of $1000. The age limit of a deputy is 25 years, and his income must be not less than $500. In both chambers the exercise of some scientific professorship is accepted in lieu of the pecuniary income. No member of the executive branch of the government (president, cabinet minister, prefect, sub-prefect, or governor) can be elected to either chamber, nor can any judge or "fiscal" of the supreme court, nor any member of the ecclesiastical hierarchy from his diocese, province or parish, nor any judge or "fiscal" of superior and first-instance courts from their judicial districts, nor any military officer from the district where he holds a military appointment at the time of election. No country is provided with more and better safeguards against electoral and official abuses than is Peru; and yet few countries suffered more from political disorder during the 19th century. The president has no veto power, but has the right to return a law to Congress with comments within a period of ten days. Should the act be again passed without amendments it becomes law; if, however, the suggested amendments are accepted the act must go over to the next session. Congress may also sit as a court of impeachment—the senate hearing and deciding the case, and the chamber acting as prosecutor. The president, ministers of state and judges of the supreme court may be brought before this court.

Justice.—The judiciary is composed of a supreme court, superior courts and courts of first instance, and justices of the peace. The supreme conrt is established at the national capital and consists of 11 judges and 2 "fiscals" or prosecutors. The judges are selected by Congress from lists of nominees submitted by the executive. The judges of the superior courts are chosen by the president from the list of nominees submitted by the supreme court. Questions of jurisdiction between the superior and supreme courts, as well as questions of like character between the supreme court and the executive, are decided by the senate sitting as a court. The courts of first instance are established in the capitals of provinces and their judges are chosen by the superior courts of the districts in which they are located. The independence of the Peruvian courts has not been scrupulously maintained, and there has been much criticism of their character and decisions.

The national executive appoints and removes the prefects of the departments and the sub-prefects of the provinces and the prefects appoint the *gobiernadores* of the districts. The police officials throughout the republic are also appointees of the president and are under his orders.

Army.—After the Chilean War the disorders fomented by the rival military officers led to a desire to place the administration of public affairs under civilian control. This led to a material reduction in the army, which, as reorganized, consists of 4000 officers and men, divided into seven battalions of infantry of 300 men each, seven squadrons of cavalry of 125 men each, and one regiment of mountain artillery of 590 men, with six batteries of mountain guns. The reorganization of the army was carried out by 10 officers and 4 non-coms. of the French army, known as the French military mission, who are also charged with the direction of the military school at Chorrillos and all branches of military instruction. There are a military high school, preparatory school, and "school of application" in connexion with the training of young officers for the army. The head of the mission is chief of staff. Formerly the Indians were forcibly pressed into the service and the whites filled the positions of officers, in great part untrained. Now military service is obligatory for all Peruvians between the ages of 19 and 50, who are divided into four classes, first and second reserves (19 to 30, and 30 to 35 years), supernumeraries (those who have purchased exemption from service in the regular army), and the national guard (35 to 50 years). The regular force is maintained by annual drawings from the lists of young men 19 years of age in the first reserves, who are required to serve fonr years. The direction of military affairs is entrusted to a general staff, which was reorganized in 1904 on the lines adopted by the great military powers of Enrope. The republic is divided into four military districts with headquarters at Piura, Lima, Arequipa and Iquitos, and these into eleven circumscriptions. The mounted police force of the republic is also organized on a military basis.

Navy.—The Peruvian navy was practically annihilated in the war with Chile, and the poverty of the country prevented for many years the adoption of any measure for its rebuilding. In 1908 it consisted of only five vessels. The naval school at Callao is under the direction of an officer of the French navy. In addition to the foregoing the government has a few small river boats on the Marañon and its tributaries, which are commanded by naval officers and used to maintain the anthority of the republic and carry on geographical and hydrographical work.

Finance.—The financial record of Peru, notwithstanding her enormous natural resources, has been one of disaster and discredit. Internal strife at first prevented the development of her resonrces, and then when the export of guano and nitrates supplied her treasury with an abundance of funds the money was squandered on extravagant enterprises and in corrupt practices. This was followed by the loss of these resources, bankruptcy, and eventually the surrender of her principal assets to her foreign creditors. The government then had to readjust expenditures to largely diminished resources; but the obligation has been met intelligently and courageously, and since 1895 there has been an improvement in the financial state of the country. The public revenues are derived from customs, taxes, various inland and consumption taxes, state monopolies, the government wharves, posts and telegraphs, &c. The customs taxes include import and export duties, surcharges, harbour dues, warehouse charges, &c.; the inland taxes comprise consumption taxes on alcohol, tobacco, sugar and matches, stamps and stamped paper, capital and mining properties, licences, transfers of property, &c.; and the state monopolies cover opium and salt. In 1905 a loan of £600,000 was floated in Germany for additions to the navy. The growth of receipts and expenditure is shown in the following table:—

	1904.	1906.	1908.
Revenue	£1,990,568	£2,527,766	£2,997,433
Expenditure	£1,884,949	£2,178,252	£3,043,032

The revenues of 1896 were only £1,128,714.

The foreign deht began with a small loan of £1,200,000 in London in 1822, and another of £1,500,000 in 1825 of which only £716,516 was placed. At the end of the war, these loans, and sums owing to Chile and Colombia, raised the foreign deht to £4,000,000. In

1830 the debt and accumulated interest owing in London amounted to £2,310,767, in addition to which there was a home debt of 17,183,397 dollars. In 1848 the two London loans and accumulated interest were covered by a new loan of £3,736,400, and the home debt was partially liquidated, the sale of guano giving the treasury ample resources. Lavish expenditure followed and the government was soon anticipating its revenues by obtaining advances from guano consignees, usually on unfavourable terms, and then floating loans. There was another conversion loan in 1862 in the sum of £5,500,000 and in 1864 still another loan of this character was issued, nominally for £10,000,000, of which £7,000,000 only were issued. Then followed the ambitious schemes of President Balta, which with the loans of 1870 and 1872 raised the total foreign debt to £49,000,000, on which the annual interest charge was about £2,500,000, a sum wholly beyond the resources of the treasury. In 1876 interest payments on account of this debt were suspended and in 1879–1882 the war with Chile deprived Peru of her principal sources of income—the guano deposits and the Tarapacá nitrates. In 1889 the total foreign debt, including arrears of interest, was £54,000,000, and in the following year a contract was signed with the Peruvian Corporation, a company in which the bondholders became shareholders, for the transfer to it for 66 years of the state railways, the free use of certain ports, the right of navigation on Lake Titicaca, the exploitation of the remaining guano deposits up to 3,000,000 tons, and thirty-three annual subsidies of £80,000 each, in consideration of the cancellation of the debt. Some modifications were later made in the contract, owing to the government's failure to meet the annual subsidies and the corporation's failure to extend the railways agreed upon. This contract relieved Peru of its crushing burden of foreign indebtedness, and turned an apparently heavy loss to the bondholders into a possible profit. In 1910 the foreign debt stood at £3,140,000, composed of (1) Peruvian Corporation £2,160,000; (2) wharves and docks, £80,000; (3) loan of 1905, £500,000; (4) loan of 1906, £400,000.

Currency.—The single gold standard has been in force in Peru since 1897 and 1898, silver and copper being used for subsidiary coinage. The monetary unit is the Peruvian pound (*libra*) which is uniform in weight and fineness with the British pound sterling. Half and fifth pounds are also coined. The silver coinage consists of the *sol* (100 cents), half *sol* (50 cents), and pieces of 20 (*peseta*), 10 and 5 cents; and the copper coinage of 1 and 2 cents. The single standard has worked well, and has contributed much toward the recovery of Peruvian commerce and finance. The change from the double standard was effected without any noticeable disturbance in commercial affairs, but this was in part due to the precaution of making the British pound sterling legal tender in the republic and establishing the legal equivalent between gold and silver at 10 *soles* to the pound. The coinage in 1906–1907 was about £150,000 gold and £65,000 silver, and the total circulation in that year was estimated at £1,400,000 in gold coin and £600,000 in silver coin. Previous to the adoption of the single gold standard in 1897 the monetary history of Peru had been unfortunate. The first national coinage was begun in 1822, and the decimal system was adopted in 1863. Although the double standard was in force, gold was practically demonetized by the monetary reform of 1872 because of the failure to fix a legal ratio between the two metals. Experience with paper currency has been even more disastrous. During the administration (1872–1876) of President Pardo the government borrowed heavily from the banks to avoid the suspension of work on the railways and port improvements. These banks enjoyed the privilege of issuing currency notes to the amount of three times the cash in hand without regard to their commercial liabilities. A large increase in imports, caused by fictitious prosperity and inability to obtain drafts against guano shipments, led to the exportation of coin to meet commercial obligations, and this soon reduced the currency circulation to a paper basis. The government being unable to repay its loans from the banks compelled the latter to suspend the conversion of their notes, which began to depreciate in value. In 1875 the banks were granted a *moratorium*, to enable them to obtain coin, but without result. The government in 1877 contracted a new loan with the banks and assumed responsibility for their outstanding emissions, which are said to have aggregated about 100,000,000 *soles*, and were worth barely 10% of their nominal value. At last their depreciation reached a point where their acceptance was generally refused and silver was imported for commercial needs, when the government suspended their legal tender quality and allowed them to disappear.

Weights and Measures.—The French metric system is the official standard of weights and measures and is in use in the custom-houses of the republic and in foreign trade, but the old units are still commonly used among the people. These are the ounce, 1·104 oz. avoirdupois; the *libra*, 1·014 lb avoirdupois; the *quintal*, 101·44 lb avoirdupois; the *arroba*, 25·36 lb avoirdupois; ditto of wine, 6·70 imperial gallons; the gallon, ·74 of an imperial gallon; the *vara*, ·927 yard; and the square *vara*, 859 square yard.

(A. J. L.)

History.—Cyclopean ruins of vast edifices, apparently never completed, exist at Tiahuanaco near the southern shore of Lake Titicaca. Remains of a similar character are found at Huaraz in the north of Peru, and at Cuzco, Ollantay-tambo and Huiñaque between Huaraz and Tiahuanaco. These works appear to have been erected by powerful sovereigns with unlimited command of labour, possibly with the object of giving employment to subjugated people, while feeding the vanity or pleasing the taste of the conqueror. Of their origin nothing is historically known. It is probable, however, that the settlement of the Cuzco valley and district by the Incas or "people of the sun" took place some 300 years before Pizarro landed in Peru. The conquering tribe or tribes had made their way to the *sierra* from the plains, and found themselves a new land sheltered from attack amidst the lofty mountains that hem in the valley of Cuzco and the vast lake basin of Titicaca, situated 12,000 ft. above the sea level. The first historical records show us these people already possessed of a considerable civilization, and speaking two allied languages, Aymara and Quichua. The expansion of the Inca rule and the formation of the Peruvian Empire was of modern growth at the time of the Spanish conquest, and dated from the victories of Pachacutic Inca who lived about a century before Huayna Capac, the Great Inca, whose death took place in 1526, the year before Pizarro first appeared on the coast. His consolidated empire extended from the river Ancasmayu north of Quito to the river Maule in the south of Chile. The Incas had an elaborate system of state-worship, with a ritual, and frequently recurring festivals. History and tradition were preserved by the bards, and dramas were enacted before the sovereign and his court. Roads with post-houses at intervals were made over the wildest mountain-ranges and the bleakest deserts for hundreds of miles. A well-considered system of land-tenure and of colonization provided for the wants of all classes of the people. The administrative details of government were minutely and carefully organized, and accurate statistics were kept by means of the "quipus" or system of knots. The edifices displayed marvellous building skill, and their workmanship is unsurpassed. The world has nothing to show, in the way of stone-cutting and fitting, to equal the skill and accuracy displayed in the Inca structures of Cuzco. As workers in metals and as potters they displayed infinite variety of design, while as cultivators and engineers they excelled their European conquerors. (For illustrations see AMERICA, Plate V.)

The story of the conquest has been told by Prescott and Helps, who give ample references to original authorities; it will be sufficient here to enumerate the dates of the leading events. On the 10th of March 1526 the contract for the conquest of Peru was signed by Francisco Pizarro, Diego de Almagro and Hernando Luque, Gaspar de Espinosa supplying the funds. In 1527 Pizarro, after enduring fearful hardships, first reached the coast of Peru at Tumbez. In the following year he went to Spain, and on the 26th of July 1529 the capitulation with the Crown for the conquest of Peru was executed. Pizarro sailed from San Lucar with his brothers in January 1530, and landed at Tumbes in 1531. The civil war between Huascar and Atahualpa, the sons of Huayna Capac, had been fought out in the meanwhile, and the victorious Atahualpa was at Cajamarca on his way from Quito to Cuzco. On the 15th of November 1532 Pizarro with his little army, made his way to Cajamarca, where he received a friendly welcome from the Inca, whom he treacherously seized and made prisoner. He had with him only 183 men. In February 1533 his colleague Almagro arrived with reinforcements. The murder of the Inca Atahualpa was perpetrated on the 29th of August 1533, and on the 15th of November Pizarro entered Cuzco. He allowed the rightful heir to the empire, Manco, the legitimate son of Huayna Capac, to be solemnly crowned on the 24th of March 1534. Almagro then undertook an expedition to Chile, and Pizarro founded the city of Lima on the 18th of January 1535. In the following year the Incas made a brave attempt to expel the invaders, and closely besieged the Spaniards in Cuzco during February and March. But Almagro, returning from Chile, raised the siege on the 18th of April 1537. Immediately afterwards a dispute arose between the brothers, Francisco, Juan and Gonzalo Pizarro and Almagro

Conquest by Pizarro.

as to the limits of their respective jurisdictions. An interview took place at Mala, on the sea-coast, on the 13th of November 1537, which led to no result, and Almagro was finally defeated in the battle of Las Salinas near Cuzco on the 26th of April 1538. His execution followed. His adherents recognized his young half-caste son, a gallant and noble youth generally known as Almagro the Lad, as his successor. Bitterly discontented, they conspired at Lima and assassinated Francisco Pizarro on the 26th of June 1541. Meanwhile Vaca de Castro had been sent out as governor of Peru by Charles V., and on hearing of the murder of Pizarro he assumed the government of the country. On the 16th of September 1542 he defeated the army of Almagro the Lad in the battle of Chupas near Guamanga, and the boy was beheaded at Cuzco.

Civil Wars. Charles V. enacted the code known as the "New Laws" in 1542. "Encomiendas," or grants of estates on which the inhabitants were bound to pay tribute and give personal service to the grantee, were to pass to the Crown on the death of the actual holder; a fixed sum was to be assessed as tribute; and forced personal service was forbidden. Blasco Nunez de Vela was sent out, as first viceroy of Peru, to enforce the "New Laws." Their promulgation aroused a storm among the conquerors. Gonzalo Pizarro rose in rebellion, and entered Lima on the 28th of October 1544. The viceroy fled to Quito, but was followed, defeated and killed at the battle of Anaquito on the 18th of January 1546. The "New Laws" were weakly revoked, and Pedro de la Gasca, as first president of the Audiencia (court of justice) of Peru, was sent out to restore order. He arrived in 1547, and on the 8th of April 1548 he routed the followers of Gonzalo Pizarro on the plain of Sacsahuaman near Cuzco. Gonzalo was executed on the field. La Gasca made a redistribution of "encomiendas" to the loyal conquerors, which caused great discontent, and left Peru before his scheme was made public in January 1550. On the 23rd of September 1551 Don Antonio de Mendoza arrived as second viceroy, but he died at Lima in the following July. The country was then ruled by the judges of the Audiencia, and a formidable insurrection broke out, headed by Francisco Hernandez Giron, with the object of maintaining the right of the conquerors to exact forced service from the Indians. In May 1554 Giron defeated the army of the judges at Chuquinga, but he was hopelessly routed at Pucara on the 11th of October 1554, captured, and on the 7th of December executed at Lima. Don Andres Hurtado de Mendoza, marquis of Cañete, entered Lima as third viceroy of Peru on the 6th of July 1555, and ruled with an iron hand for six years. All the leaders in former disturbances were sent to Spain. Corregidors, or governors of districts, were ordered to try summarily and execute every turbulent person within their jurisdictions. All unemployed persons were sent on distant expeditions, and moderate "encomiendas" were granted to a few deserving officers. At the same time the viceroy wisely came to an agreement with Sayri Tupac, the son and successor of the Inca Manco, and granted him a pension. He took great care to supply the natives with priests of good conduct, and promoted measures for the establishment of schools and the foundation of towns in the different provinces. The cultivation of wheat, vines and olives, and European domestic animals were introduced. The next viceroy was the Conde de Nieva (1561–1564). His successor, the licentiate Lope Garcia de Castro, who only had the title of governor, ruled from 1564 to 1569. From this time there was a succession of viceroys until 1824. The viceroys were chief magistrates, but in legal matters they had to consult the Audiencia of judges, in finance the Tribunal de Cuentas, in other branches of administration the Juntas de Gobierno and de Guerra.

Toledo's Administration. Don Francisco de Toledo, the second son of the count of Oropesa, entered Lima as viceroy on the 26th of November 1569. Fearing that the little court of the Inca Tupac Amaru (who had succeeded his brother Sayri Tupac) might become a focus of rebellion, he seized the young prince, and unjustly beheaded the last of the Incas in the square of Cuzco in the year 1571. After a minute personal inspection of every province in Peru, he, with the experienced aid of the learned Polo de Ondegardo and the judge of Matienza, established the system under which the native population of Peru was ruled for the two succeeding centuries. His *Libro de Tasos* fixed the tribute to be paid by the Indians, exempting all men under eighteen and over fifty. He found it necessary, in order to secure efficient government, to revert in some measure to the system of the Incas. The people were to be directly governed by their native chiefs, whose duty was to collect the tribute and exercise magisterial functions. The chiefs or "curacas" had subordinate native officials under them called "pichca-pachacas" over 500 men, and "pachacas" over 100 men. The office of curaca or cacique, was made hereditary, and its possessor enjoyed several privileges. Many curacas were descended from the imperial family of the Incas, or from great nobles of the Incarial court. In addition to the tribute, which was in accordance with native usage, there was the "mita," or forced labour in mines, farms and manufactories. Toledo enacted that one-seventh of the male population of a village should be subject to conscription for this service, but they were to be paid, and were not to be taken beyond a specified distance from their homes.

Viceroyalty. The Spanish kings and viceroys desired to protect the people from tyranny, but they were unable to prevent the rapacity and lawlessness of distant officials and the country was depopulated by the illegal methods of enforcing the mita. Toledo was succeeded in 1581 by Don Martin Henriquez, who died at Lima two years afterwards. The Spanish colonies suffered from the strict system of monopoly and protection, which was only slightly relaxed by the later Bourbon kings, and from the arbitrary proceedings of the Inquisition. Between 1581 and 1776 as many as fifty-nine heretics were burned at Lima, and there were twenty-nine "autos"; but the Inquisition affected Europeans rather than natives, for the Indians, as catechumens, were exempted from its terrors. The curacas sorrowfully watched the gradual extinction of their people by the operation of the mita, protesting from time to time against the exactions and cruelty of the Spaniards. At length a descendant of the Incas, who assumed the name of Tupac Amaru, rose in rebellion in 1780. The insurrection lasted until July 1783, and cruel executions followed its suppression. This was the last effort of the Indians to throw off the Spanish yoke and the rising was by no means general. The army which overthrew Tupac Amaru consisted chiefly of loyal Indians, and the rebellion was purely anti-Spanish, and had no support from the Spanish population. The movement for independence, which slowly gained force during the opening decade of the 19th century, did not actually become serious until the conquest of Spain by the French in 1807–1808. The Creoles (Criallos) or American-born Spaniards had for long been aggrieved at being shut out from all important official positions, and at the restrictions placed upon their trade, but the bulk of the Creole population was not disloyal.

Peru Independent. Peru was the centre of Spanish power, and the viceroy had his military strength concentrated at Lima. Consequently the insurrections in the more distant provinces, such as Chile and Buenos Ayres, were the first to declare themselves independent, in 1816 and 1817. But the destruction of the viceroy's power was essential to their continued independent existence. The conquest of the Peruvian coast must always depend on the command of the sea. A fleet of armed ships was fitted out at Valparaiso in Chile, under the command of Lord Cochrane (afterwards earl of Dundonald) and officered by Englishmen. It convoyed an army of Argentine troops, with some Chileans, under the command of the Argentine general, San Martin, which landed on the coast of Peru in September 1820. San Martin was enthusiastically received, and the independence of Peru was proclaimed at Lima after the viceroy had withdrawn (July 28, 1821). On the 20th of September 1822 San Martin resigned the protectorate, with which he had been invested, and on the same day the first

1830 the debt and accumulated interest owing in London amounted to £2,310,767, in addition to which there was a home debt of 17,183,397 dollars. In 1848 the two London loans and accumulated interest were covered by a now loan of £3,736,400, and tho home debt was partially liquidated, the sale of guano giving the treasury ample resources. Lavish expenditure followed and the government was soon anticipating its revenues by obtaining advances from guano consignees, usually on unfavourable terms, and then floating loans. There was another conversion loan in 1862 in the sum of £5,500,000 and in 1864 still another loan of this character was issued, nominally for £10,000,000, of which £7,000,000 only were issued. Then followed the ambitious schemes of President Balta, which with the loans of 1870 and 1872 raised the total foreign debt to £49,000,000, on which the annual interest charge was about £2,500,000, a sum wholly beyond the resources of the treasury. In 1876 interest payments on account of this debt were suspended and in 1879–1882 the war with Chile deprived Peru of her principal sources of income—the guano deposits and the Tarapacá nitrates. In 1889 the total foreign debt, including arrears of interest, was £54,000,000, and in the following year a contract was signed with the Peruvian Corporation, a company in which the bondholders became shareholders, for the transfer to it for 66 years of the state railways, the free use of certain ports, the right of navigation on Lake Titicaca, the exploitation of the remaining guano deposits up to 3,000,000 tons, and thirty-three annual subsidies of £80,000 each, in consideration of the cancellation of the debt. Some modifications were later made in the contract, owing to the government's failure to meet the annual subsidies and the corporation's failure to extend the railways agreed upon. This contract relieved Peru of its crushing burden of foreign indebtedness, and turned an apparently heavy loss to the bondholders into a possible profit. In 1910 the foreign debt stood at £3,140,000, composed of (1) Peruvian Corporation £2,160,000; (2) wharves and docks, £80,000; (3) loan of 1905, £500,000; (4) loan of 1906, £400,000.

Currency.—The single gold standard has been in force in Peru since 1897 and 1898, silver and copper being used for subsidiary coinage. The monetary unit is the Peruvian pound (*libra*) which is uniform in weight and fineness with the British pound sterling. Half and fifth pounds are also coined. The silver coinage consists of the *sol* (100 cents), half *sol* (50 cents), and pieces of 20 (*peseta*), 10 and 5 cents; and the copper coinage of 1 and 2 cents. The single standard has worked well, and has contributed much toward the recovery of Peruvian commerce and finance. The change from the double standard was effected without any noticeable disturbance in commercial affairs, but this was in part due to the precaution of making the British pound sterling legal tender in the republic and establishing the legal equivalent between gold and silver at 10 *soles* to the pound. The coinage in 1906–1907 was about £150,000 gold and £65,000 silver, and the total circulation in that year was estimated at £1,400,000 in gold coin and £600,000 in silver coin. Previous to the adoption of the single gold standard in 1897 the monetary history of Peru had been unfortunate. The first national coinage was begun in 1822, and the decimal system was adopted in 1863. Although the double standard was in force, gold was practically demonetized by the monetary reform of 1872 because of the failure to fix a legal ratio between the two metals. Experience with paper currency has been even more disastrous. During the administration (1872–1876) of President Pardo the government borrowed heavily from the banks to avoid the suspension of work on the railways and port improvements. These banks enjoyed the privilege of issuing currency notes to the amount of three times the cash in hand without regard to their commercial liabilities. A large increase in imports, caused by fictitious prosperity and inability to obtain drafts against guano shipments, led to the exportation of coin to meet commercial obligations, and this soon reduced the currency circulation to a paper basis. The government being unable to repay its loans from the banks compelled the latter to suspend the conversion of their notes, which began to depreciate in value. In 1875 the banks were granted a *moratorium*, to enable them to obtain coin, but without result. The government in 1877 contracted a new loan with the banks and assumed responsibility for their outstanding emissions, which are said to have aggregated about 100,000,000 *soles*, and were worth barely 10 % of their nominal value. At last their depreciation reached a point where their acceptance was generally refused and silver was imported for commercial needs, when the government suspended their legal tender quality and allowed them to disappear.

Weights and Measures.—The French metric system is the official standard of weights and measures and is in use in the custom-houses of the republic and in foreign trade, but the old units are still commonly used among the people. These are the ounce, 1·104 oz. avoirdupois; the *libra*, 1·014 ℔ avoirdupois; the *quintal*, 101·44 ℔ avoirdupois; the *arroba*, 25·36 ℔ avoirdupois; ditto of wine, 6·70 imperial gallons; the gallon, ·74 of an imperial gallon; the *vara*, ·927 yard; and the square *vara*, ·859 square yard.

(A. J. L.)

History.—Cyclopean ruins of vast edifices, apparently never completed, exist at Tiahuanaco near the southern shore of Lake Titicaca. Remains of a similar character are found at Huaraz in the north of Peru, and at Cuzco, Ollantay-tambo and Huiñaque between Huaraz and Tiahuanaco. These works appear to have been erected by powerful sovereigns with unlimited command of labour, possibly with the object of giving employment to subjugated people, while feeding the vanity or pleasing the taste of the conqueror. Of their origin nothing is historically known. It is probable, however, that the settlement of the Cuzco valley and district by the Incas or "people of the sun" took place some 300 years before Pizarro landed in Peru. The conquering tribe or tribes had made their way to the *sierra* from the plains, and found themselves a new land sheltered from attack amidst the lofty mountains that hem in the valley of Cuzco and the vast lake basin of Titicaca, situated 12,000 ft. above the sea level. The first historical records show us these people already possessed of a considerable civilization, and speaking two allied languages, Aymara and Quichua. The expansion of the Inca rule and the formation of the Peruvian Empire was of modern growth at the time of the Spanish conquest, and dated from the victories of Pachacutic Inca who lived about a century before Huayna Capac, the Great Inca, whose death took place in 1526, the year before Pizarro first appeared on the coast. His consolidated empire extended from the river Ancasmayu north of Quito to the river Maule in the south of Chile. The Incas had an elaborate system of state-worship, with a ritual, and frequently recurring festivals. History and tradition were preserved by the bards, and dramas were enacted before the sovereign and his court. Roads with post-houses at intervals were made over the wildest mountain-ranges and the bleakest deserts for hundreds of miles. A well-considered system of land-tenure and of colonization provided for the wants of all classes of the people. The administrative details of government were minutely and carefully organized, and accurate statistics were kept by means of the "quipus" or system of knots. The edifices displayed marvellous building skill, and their workmanship is unsurpassed. The world has nothing to show, in the way of stone-cutting and fitting, to equal the skill and accuracy displayed in the Inca structures of Cuzco. As workers in metals and as potters they displayed infinite variety of design, while as cultivators and engineers they excelled their European conquerors. (For illustrations see AMERICA, Plate V.)

Conquest by Pizarro.

The story of the conquest has been told by Prescott and Helps, who give ample references to original authorities; it will be sufficient here to enumerate the dates of the leading events. On the 10th of March 1526 the contract for the conquest of Peru was signed by Francisco Pizarro, Diego de Almagro and Hernando Luque, Gaspar de Espinosa supplying the funds. In 1527 Pizarro, after enduring fearful hardships, first reached the coast of Peru at Tumbez. In the following year he went to Spain, and on the 26th of July 1529 the capitulation with the Crown for the conquest of Peru was executed. Pizarro sailed from San Lucar with his brothers in January 1530, and landed at Tumbes in 1531. The civil war between Huascar and Atahualpa, the sons of Huayna Capac, had been fought out in the meanwhile, and the victorious Atahualpa was at Cajamarca on his way from Quito to Cuzco. On the 15th of November 1532 Pizarro with his little army, made his way to Cajamarca, where he received a friendly welcome from the Inca, whom he treacherously seized and made prisoner. He had with him only 183 men. In February 1533 his colleague Almagro arrived with reinforcements. The murder of the Inca Atahualpa was perpetrated on the 29th of August 1533, and on the 15th of November Pizarro entered Cuzco. He allowed the rightful heir to the empire, Manco, the legitimate son of Huayna Capac, to be solemnly crowned on the 24th of March 1534. Almagro then undertook an expedition to Chile, and Pizarro founded the city of Lima on the 18th of January 1535. In the following year the Incas made a brave attempt to expel the invaders, and closely besieged the Spaniards in Cuzco during February and March. But Almagro, returning from Chile, raised the siege on the 18th of April 1537. Immediately afterwards a dispute arose between the brothers, Francisco, Juan and Gonzalo Pizarro and Almagro

principal conditions imposed by Chile were the absolute cession by Peru of the province of Tarapacá, and the occupation for a period of ten years of the territories of Tacna and Arica, the ownership of these districts to be decided by a popular vote of the inhabitants of Tacna and Arica at the expiration of the period named. A further condition was enacted that an indemnity of 10,000,000 soles was to be paid by the country finally remaining in possession—a sum equal to about £1,000,000 to-day. The Peruvians in the interior refused to recognize President Iglesias, and at once began active operations to overthrow his authority on the final departure of the Chilean troops. Affairs continued in this unsettled state until the middle of 1885, Cáceres meanwhile steadily gaining many adherents to his side of the quarrel. In the latter part of 1885 President Iglesias abdicated.

Under the guidance of General Cáceres a *junta* was then formed to carry on the government until an election for the presidency should be held and the senate and chamber of deputies constituted. In the following year (1886) General Cáceres was elected president of the republic for the usual term of four years. The task assumed by the new president was no sinecure. The country had been thrown into absolute confusion from a political and administrative point of view, but gradually order was restored, and peaceful conditions were reconstituted throughout the republic. The four years of office for which General Cáceres was elected passed in uneventful fashion, and in 1890 Señor Morales Bermudez was nominated to the presidency, with Señor Solar and Señor Borgoño as first and second vice-presidents. Matters continued without alteration from the normal course until 1894, and in that year Bermudez died suddenly a few months before the expiration of the period for which he had been chosen as president. General Cáceres secured the nomination of the vice-president Borgoño as chief of the executive for the unexpired portion of the term of the late president Bermudez. This action was unconstitutional, and was bitterly resented by the vice-president Solar, who by right should have succeeded to the office. Armed resistance to the authority of Borgoño was immediately organized in the south of Peru, the movement being supported by Señores Nicolas de Pierola, Billinghurst, Durand and a number of influential Peruvians. In the month of August 1894 General Cáceres was again elected to fill the office of president, but the revolutionary movement rapidly gained ground. President Cáceres adopted energetic measures to suppress the outbreak: his efforts, however, proved unavailing, the close of 1894 find the country districts in the power of the rebels and the authority of the legal government confined to Lima and other cities held by strong garrisons. Early in March 1895 the insurgents encamped near the outskirts of Lima, and on the 17th, 18th and 19th of March severe fighting took place, ending in the defeat of the troops under General Cáceres. A suspension of hostilities was then brought about by the efforts of H.B.M. consul. The loss on both sides to the struggle during these two days was 2800 killed and wounded. President Cáceres, finding his cause was lost, left the country, a provisional government under Señor Candamo assuming the direction of public affairs.

Cáceres in Power.

On the 8th of September 1895 Señor Pierola was declared president of the republic for the following four years. The Peruvians were now heartily tired of revolutionary disturbances, and an insurrectionary outbreak in the district of Iquitos met with small sympathy, and was speedily crushed. In 1896 a reform of the electoral law was sanctioned. By the provisions of this act an electoral committee was constituted, composed of nine members, two of these nominated by the senate, two by the chamber of deputies, four by the supreme court, and one by the president with the consent of his ministers. To this committee was entrusted the task of the examination of all election returns, and of the proclamation of the names of successful candidates for seats in congress. Another reform brought about by Pierola was a measure introduced and sanctioned in 1897 for a modification of the marriage laws. Under the new act marriages of non-Catholics solemnized by diplomatic or consular officers or by ministers of dissenting churches, if properly registered, are valid, and those solemnized before the passing of this act were to be valid if registered before the end of 1899. Revolutionary troubles again disturbed the country in 1899, when the presidency of Señor Pierola was drawing to a close. In consequence of dissensions amongst the members of the election committee constituted by the act of 1896, the president ordered the suppression of this body. A group of malcontents under the leadership of one Durand, a man who had been prominent in the revolution against General Cáceres in 1894–95, conspired against the authorities and raised several armed bands, known locally as *montaneras*. Some skirmishes occurred between these insurgents and the government troops, the latter generally obtaining the advantage in these encounters.

Pierola President.

In September 1899 President Pierola vacated the presidency in favour of Señor Romaña, who had been elected to the office as a popular candidate and without the exercise of any undue official influence. President Romaña was educated at Stonyhurst in England, and was a civil engineer by profession. The principal political problem before the government of Peru was the ownership of the territories of Tacna and Arica. The period of ten years originally agreed upon for the Chilean occupation of these provinces expired in 1894. At that date the peace of Peru was so seriously disturbed by internal troubles that the government was quite unable to take active steps to bring about any solution of th matter. After 1894 negotiations between the two governments were attempted from time to time, but without any satisfactory results. The question hinged to a great extent on the qualification necessary for the inhabitants to vote, in the event of a plebiscite being called to decide whether Chilean ownership was to be finally established or the provinces were to revert to Peruvian sovereignty. Peru proposed that only Peruvian residents should be entitled to take part in a popular vote; Chile rejected this proposition, on the ground that all residents in the territories in question should have a voice in the final decision. The agreement between Chile and Bolivia, by which the disputed provinces were to be handed over to the latter country if Chilean possession was recognized, was also a stumbling-block, a strong feeling existed among Peruvians against this proceeding. It was not so much the value of Tacna and Arica that put difficulties in the way of a settlement as the fact that the national pride of the Peruvians ill brooked the idea of permanently losing all claim to this section of country. The money, about £1,000,000 could probably have been obtained to indemnify Chile if occasion for it arose.

Romaña President.

The question of the delimitation of the frontier between Peru and the neighbouring republics of Ecuador, Colombia, and Brazil also cropped up at intervals. A treaty was signed with Brazil 1876, by which certain physical features were accepted by both countries as the basis for the boundary. In the case of Ecuador and Colombia a dispute arose in 1894 concerning the ownership of large tracts of uninhabited country in the vicinity of the headwaters of the Amazon and its tributaries. An agreement was proposed between Peru and Ecuador in connexion with the limits of the respective republics, but difficulties were created to prevent this proposal from becoming an accomplished fact by the pretensions put forward by Colombia. The latter state claimed sovereignty over the Napo and Marañon rivers on the grounds of the ecclesiastical jurisdiction exercised over this section of territory during the period of Spanish dominion, the government of Colombia asserting that these ecclesiastical rights to which Colombia became entitled after her separation from the Spanish crown carried also the right of absolute ownership. In a treaty signed by the three interested states in 1895 a compromise was effected by which Colombia withdrew a part of the claim advanced, and it was agreed that any further differences arising out of this frontier question should be submitted to the arbitration of the Spanish crown. The later development of the boundary question is dealt with at the outset of this article.

1830 the debt and accumulated interest owing in London amounted to £2,310,767, in addition to which there was a home debt of 17,183,397 dollars. In 1848 the two London loans and accumulated interest were covered by a new loan of £3,736,400, and the home debt was partially liquidated, the sale of guano giving the treasury ample resources. Lavish expenditure followed and the government was soon anticipating its revenues by obtaining advances from guano consignees, usually on unfavourable terms, and then floating loans. There was another conversion loan in 1862 in the sum of £5,500,000 and in 1864 still another loan of this character was issued, nominally for £10,000,000, of which £7,000,000 only were issued. Then followed the ambitious schemes of President Balta, which with the loans of 1870 and 1872 raised the total foreign debt to £49,000,000, on which the annual interest charge was about £2,500,000, a sum wholly beyond the resources of the treasury. In 1876 interest payments on account of this debt were suspended and in 1879–1882 the war with Chile deprived Peru of her principal sources of income—the guano deposits and the Tarapacá nitrates. In 1889 the total foreign debt, including arrears of interest, was £54,000,000, and in the following year a contract was signed with the Peruvian Corporation, a company in which the bondholders became shareholders, for the transfer to it for 66 years of the state railways, the free use of certain ports, the right of navigation on Lake Titicaca, the exploitation of the remaining guano deposits up to 3,000,000 tons, and thirty-three annual subsidies of £80,000 each, in consideration of the cancellation of the debt. Some modifications were later made in the contract, owing to the government's failure to meet the annual subsidies and the corporation's failure to extend the railways agreed upon. This contract relieved Peru of its crushing burden of foreign indebtedness, and turned an apparently heavy loss to the bondholders into a possible profit. In 1910 the foreign debt stood at £3,140,000, composed of (1) Peruvian Corporation £2,160,000; (2) wharves and docks, £80,000; (3) loan of 1905, £500,000; (4) loan of 1906, £400,000.

Currency.—The single gold standard has been in force in Peru since 1897 and 1898, silver and copper being used for subsidiary coinage. The monetary unit is the Peruvian pound (*libra*) which is uniform in weight and fineness with the British pound sterling. Half and fifth pounds are also coined. The silver coinage consists of the *sol* (100 cents), half *sol* (50 cents), and pieces of 20 (*peseta*), 10 and 5 cents; and the copper coinage of 1 and 2 cents. The single standard has worked well, and has contributed much toward the recovery of Peruvian commerce and finance. The change from the double standard was effected without any noticeable disturbance in commercial affairs, but this was in part due to the precaution of making the British pound sterling legal tender in the republic and establishing the legal equivalent between gold and silver at 10 *soles* to the pound. The coinage in 1906–1907 was about £150,000 gold and £65,000 silver, and the total circulation in that year was estimated at £1,400,000 in gold coin and £600,000 in silver coin. Previous to the adoption of the single gold standard in 1897 the monetary history of Peru had been unfortunate. The first national coinage was begun in 1822, and the decimal system was adopted in 1863. Although the double standard was in force, gold was practically demonetized by the monetary reform of 1872 because of the failure to fix a legal ratio between the two metals. Experience with paper currency has been even more disastrous. During the administration (1872–1876) of President Pardo the government borrowed heavily from the banks to avoid the suspension of work on the railways and port improvements. These banks enjoyed the privilege of issuing currency notes to the amount of three times the cash in hand without regard to their commercial liabilities. A large increase in imports, caused by fictitious prosperity and inability to obtain drafts against guano shipments, led to the exportation of coin to meet commercial obligations, and this soon reduced the currency circulation to a paper basis. The government being unable to repay its loans from the banks compelled the latter to suspend the conversion of their notes, which began to depreciate in value. In 1875 the banks were granted a *moratorium*, to enable them to obtain coin, but without result. The government in 1877 contracted a new loan with the banks and assumed responsibility for their outstanding emissions, which are said to have aggregated about 100,000,000 *soles*, and were worth barely 10 % of their nominal value. At last their depreciation reached a point where their acceptance was generally refused and silver was imported for commercial needs, when the government suspended their legal tender quality and allowed them to disappear.

Weights and Measures.—The French metric system is the official standard of weights and measures and is in use in the custom-houses of the republic and in foreign trade, but the old units are still commonly used among the people. These are the ounce, 1·104 oz. avoirdupois; the *libra*, 1·014 ℔ avoirdupois; the *quintal*, 101·44 ℔ avoirdupois; the *arroba*, 25·36 ℔ avoirdupois; ditto of wine, 6·70 imperial gallons; the gallon, ·74 of an imperial gallon; the *vara*, ·927 yard; and the square *vara*, 859 square yard.

(A. J. L.)

History.—Cyclopean ruins of vast edifices, apparently never completed, exist at Tiahuanaco near the southern shore of Lake Titicaca. Remains of a similar character are found at Huaraz in the north of Peru, and at Cuzco, Ollantay-tambo and Huiñaque between Huaraz and Tiahuanaco. These works appear to have been erected by powerful sovereigns with unlimited command of labour, possibly with the object of giving employment to subjugated people, while feeding the vanity or pleasing the taste of the conqueror. Of their origin nothing is historically known. It is probable, however, that the settlement of the Cuzco valley and district by the Incas or "people of the sun" took place some 300 years before Pizarro landed in Peru. The conquering tribe or tribes had made their way to the *sierra* from the plains, and found themselves a new land sheltered from attack amidst the lofty mountains that hem in the valley of Cuzco and the vast lake basin of Titicaca, situated 12,000 ft. above the sea level. The first historical records show us these people already possessed of a considerable civilization, and speaking two allied languages, Aymara and Quichua. The expansion of the Inca rule and the formation of the Peruvian Empire was of modern growth at the time of the Spanish conquest, and dated from the victories of Pachacutic Inca who lived about a century before Huayna Capac, the Great Inca, whose death took place in 1526, the year before Pizarro first appeared on the coast. His consolidated empire extended from the river Ancasmayu north of Quito to the river Maule in the south of Chile. The Incas had an elaborate system of state-worship, with a ritual, and frequently recurring festivals. History and tradition were preserved by the bards, and dramas were enacted before the sovereign and his court. Roads with post-houses at intervals were made over the wildest mountain-ranges and the bleakest deserts for hundreds of miles. A well-considered system of land-tenure and of colonization provided for the wants of all classes of the people. The administrative details of government were minutely and carefully organized, and accurate statistics were kept by means of the "quipus" or system of knots. The edifices displayed marvellous building skill, and their workmanship is unsurpassed. The world has nothing to show, in the way of stone-cutting and fitting, to equal the skill and accuracy displayed in the Inca structures of Cuzco. As workers in metals and as potters they displayed infinite variety of design, while as cultivators and engineers they excelled their European conquerors. (For illustrations see America, Plate V.)

Conquest by Pizarro.

The story of the conquest has been told by Prescott and Helps, who give ample references to original authorities; it will be sufficient here to enumerate the dates of the leading events. On the 10th of March 1526 the contract for the conquest of Peru was signed by Francisco Pizarro, Diego de Almagro and Hernando Luque, Gaspar de Espinosa supplying the funds. In 1527 Pizarro, after enduring fearful hardships, first reached the coast of Peru at Tumbez. In the following year he went to Spain, and on the 26th of July 1529 the capitulation with the Crown for the conquest of Peru was executed. Pizarro sailed from San Lucar with his brothers in January 1530, and landed at Tumbes in 1531. The civil war between Huascar and Atahualpa, the sons of Huayna Capac, had been fought out in the meanwhile, and the victorious Atahualpa was at Cajamarca on his way from Quito to Cuzco. On the 15th of November 1532 Pizarro with his little army, made his way to Cajamarca, where he received a friendly welcome from the Inca, whom he treacherously seized and made prisoner. He had with him only 183 men. In February 1533 his colleague Almagro arrived with reinforcements. The murder of the Inca Atahualpa was perpetrated on the 29th of August 1533, and on the 15th of November Pizarro entered Cuzco. He allowed the rightful heir to the empire, Manco, the legitimate son of Huayna Capac, to be solemnly crowned on the 24th of March 1534. Almagro then undertook an expedition to Chile, and Pizarro founded the city of Lima on the 18th of January 1535. In the following year the Incas made a brave attempt to expel the invaders, and closely besieged the Spaniards in Cuzco during February and March. But Almagro, returning from Chile, raised the siege on the 18th of April 1537. Immediately afterwards a dispute arose between the brothers, Francisco, Juan and Gonzalo Pizarro and Almagro

with nave and aisles, founded in the beginning of the 11th century by San Pietro Vincioli on the site of a building of the 6th century, and remarkable for its conspicuous spire, its ancient granite and marble columns, its walnut stall-work of 1535 by Stefano de' Zambelli da Bergamo, and its numerous pictures (by Perugino, &c.). The oratory of S. Bernardino has an early Renaissance polychrome façade, richly sculptured, of 1457–1461, by Agostino d'Antonio di Duccio of Florence. S. Severo contains Raphael's first independent fresco (1505), much damaged by restoration. The circular church of S. Angelo, with sixteen antique columns in the interior, probably dates from the middle of the 6th century. The university dates from 1307, and has faculties of law, science and medicine; it had 318 students in 1902–1903. It contains an important museum of Etruscan and Roman antiquities. Three miles to the S.S.E. the Etruscan necropolis of the ancient city was discovered in 1870. The large tomb of the Volumni (3rd century B.C.) hewn in the rock, with its carved cinerary urns, is interesting.

The ancient Perusia first appears in history as one of the twelve confederate cities of Etruria. It is first mentioned in the account of the war of 310 or 309 B.C. between the Etruscans and the Romans. It took, however, an important part in the rebellion of 295, and was reduced, with Vulsinii and Arretium, to seek for peace in the following year. In 216 and 205 it assisted Rome in the Hannibalic war, but afterwards it is not mentioned until 41–40 B.C., when L. Antonius took refuge there, and was reduced by Octavian after a long siege. A number of lead bullets used by slingers have been found in and around the city (*Corpus inscr. lat.* xi. 1212). The city was burnt, we are told, with the exception of the temples of Vulcan and Juno —the massive Etruscan terrace-walls, naturally, can hardly have suffered at all—and the town, with the territory for a mile round, was allowed to be occupied by whoever chose. It must have been rebuilt almost at once, for several bases exist, inscribed *Augusto sacr(um) Perusia restituta*; but, as we have seen, it did not become a colony until A.D. 251–253. It is hardly mentioned except by the geographers until the middle of the 6th century, when it was captured by Totila after a long siege. In the Lombard period it is spoken of as one of the principal cities of Tuscia. In the 9th century, with the consent of Charles the Great and Louis the Pious, it passed under the popes; but for many centuries the city continued to maintain an independent life, warring against many of the neighbouring lands and cities—Foligno, Assisi, Spoleto, Montepulciano, &c. It remained true for the most part to the Guelphs. On various occasions the popes found asylum within its walls, and it was the meeting-place of the conclaves which elected Honorius II. (1124), Honorius IV. (1285), Celestine V. (1294), and Clement V. (1305). But Perugia had no mind simply to subserve the papal interests. At the time of Rienzi's unfortunate enterprise it sent ten ambassadors to pay him honour; and, when papal legates sought to coerce it by foreign soldiers, or to exact contributions, they met with vigorous resistance. In the 15th century power was at last concentrated in the Baglioni family, who, though they had no legal position, defied all other authority. Gian Paolo Baglioni was lured to Rome in 1520 and beheaded by Leo X.; and in 1534 Rodolfo, who had slain a papal legate, was defeated by Pier Luigi Farnese, and the city, captured and plundered by his soldiery, was deprived of its privileges. The citadel was begun six years later "ad coercendam Perusinorum audaciam." In 1797 Perugia was occupied by the French; in 1832, 1838 and 1854 it was visited by earthquakes; in May 1849 it was seized by the Austrians; and, after a futile insurrection in 1859, it was finally united, along with the rest of Umbria, to Piedmont, in 1860.

See G. Conestabile, *I Monumenti di Perugia etrusca e romana* (Perugia, 1855); M. Symonds and L. Duff Gordon, *Perugia* ("Mediaeval Towns Series") (1898); R. A. Gallenga Stuart, *Perugia* (Bergamo, 1905); W. Heywood, *Hist. of Perugia* (1910). (T. As.)

PERUGINO, PIETRO (1446–1524), whose correct family name was VANNUCCI, Italian painter, was born in 1446 at Città della Pieve in Umbria, and belongs to the Umbrian school of painting. The name of Perugino came to him from Perugia, the chief city of the neighbourhood. Pietro was one of several children born to Cristoforo Vannucci, a member of a respectable family settled at Città della Pieve. Though respectable, they seem to have been poor, or else, for some reason or other, to have left Pietro uncared for at the opening of his career. Before he had completed his ninth year the boy was articled to a master, a painter at Perugia. Who this may have been is very uncertain; the painter is spoken of as wholly mediocre, but sympathetic for the great things in his art. Benedetto Bonfigli is generally surmised; if he is rejected as being above mediocrity, either Fiorenzo di Lorenzo or Niccolò da Foligno may possibly have been the man. Pietro painted a little at Arezzo; thence he went to the headquarters of art, Florence, and frequented the famous Brancacci Chapel in the church of the Carmine. It appears to be sufficiently established that he studied in the atelier of Andrea del Verrocchio, where Leonardo da Vinci was also a pupil. He may have learned perspective, in which he particularly excelled for that period of art, from Piero de' Franceschi. The date of this first Florentine sojourn is by no means settled; some authorities incline to make it as early as 1470, while others, with perhaps better reason, postpone it till 1479. Pietro at this time was extremely poor; he had no bed, but slept on a chest for many months, and, bent upon making his way, resolutely denied himself every creature comfort.

Gradually Perugino rose into notice, and became famous not only throughout Italy but even beyond. He was one of the earliest Italian painters to practise oil-painting, in which he evinced a depth and smoothness of tint, which elicited much remark; and in perspective he applied the novel rule of two centres of vision. Some of his early works were extensive frescoes for the Ingesati fathers in their convent, which was destroyed not many years afterwards in the course of the siege of Florence; he produced for them also many cartoons, which they executed with brilliant effect in stained glass. Though greedy for gain, his integrity was proof against temptation; and an amusing anecdote has survived of how the prior of the Ingesati doled out to him the costly colour of ultramarine, and how Perugino, constantly washing his brushes, obtained a surreptitious hoard of the pigment, which he finally restored to the prior to shame his stingy suspiciousness. A good specimen of his early style in tempera is the circular picture in the Louvre of the "Virgin and Child enthroned between Saints."

Perugino returned from Florence to Perugia, and thence, towards 1483, he went to Rome. The painting of that part of the Sixtine Chapel which is now immortalized by Michelangelo's "Last Judgment" was assigned to him by the pope; he covered it with frescoes of the "Assumption," the "Nativity," and "Moses in the Bulrushes." These works were ruthlessly destroyed to make a space for his successor's more colossal genius, but other works by Perugino still remain in the Sixtine Chapel: "Moses and Zipporah" (often attributed to Signorelli), the "Baptism of Christ," and "Christ giving the Keys to Peter." Pinturicchio accompanied the greater Umbrian to Rome, and was made his partner, receiving a third of the profits; he may probably have done some of the Zipporah subject.

Pietro, now aged forty, must have left Rome after the completion of the Sixtine paintings in 1486, and in the autumn of that year he was in Florence. Here he figures by no means advantageously in a criminal court. In July 1487 he and another Perugian painter named Aulista di Angelo were convicted, on their own confession, of having in December waylaid with staves some one (the name does not appear) in the street near S. Pietro Maggiore. Perugino limited himself, in intention, to assault and battery, but Aulista had made up his mind for murder. The minor and more illustrious culprit was fined ten gold florins, and the major one exiled for life.

Between 1486 and 1499 Perugino resided chiefly in Florence, making one journey to Rome and several to Perugia. He was in many other parts of Italy from time to time. He had a regular shop in Florence, received a great number of commissions, and continued developing his practice as an oil-painter, his

system of superposed layers of colour being essentially the same as that of the Van Eycks. One of his most celebrated pictures, the "Pietà" in the Pitti Gallery, belongs to the year 1495. From about 1498 he became increasingly keen after money, frequently repeating his groups from picture to picture, and leaving much of his work to journeymen. In 1499 the gild of the cambio (money-changers or bankers) of Perugia asked him to undertake the decoration of their audience-hall, and he accepted the invitation. This extensive scheme of work, which may have been finished within the year 1500, comprised the painting of the vault with the seven planets and the signs of the zodiac (Perugino doing the designs and his pupils most probably the executive work) and the representation on the walls of two sacred subjects—the "Nativity" and "Transfiguration"—the Eternal Father, the four virtues of Justice, Prudence, Temperance and Fortitude, Cato as the emblem of wisdom, and (in life size) numerous figures of classic worthies, prophets and sibyls. On the mid-pilaster of the hall Perugino placed his own portrait in bust-form. It is probable that Raphael, who in boyhood, towards 1496, had been placed by his uncles under the tuition of Perugino, bore a hand in the work of the vaulting. It may have been about this time (though some accounts date the event a few years later) that Vannucci married a young and beautiful wife, the object of his fond affection; he loved to see her handsomely dressed, and would often deck her out with his own hands. He was made one of the priors of Perugia in 1501.

While Perugino, though by no means stationary or unprogressive as an executive artist, was working contentedly upon the old lines and carrying out the ancient conceptions, a mighty wave of new art flooded Florence with its rush and Italy with its rumour. Michelangelo, twenty-five years of age in 1500, following after and distancing Leonardo da Vinci, was opening men's eyes and minds to possibilities of achievement as yet unsurmised. Vannucci in Perugia heard Buonarroti bruited abroad, and was impatient to see with his own eyes what the stir was all about. In 1504 he allowed his apprentices and assistants to disperse, and returned to Florence. Though not openly detracting, he viewed with jealousy and some grudging the advances made by Michelangelo; and Michelangelo on his part replied, with the intolerance which pertains to superiority, to the faint praise or covert dispraise of his senior and junior in the art. On one occasion, in company, he told Perugino to his face that he was "a bungler in art" (*goffo nell' arte*). Vannucci brought, with equal indiscretion and ill success, an action for defamation of character. Put on his mettle by this mortifying transaction, he determined to show what he could do, and he produced the *chef-d'œuvre* of the "Madonna and Saints" for the Certosa of Pavia. The constituent parts of this noble work have now been sundered. The only portion which remains in the Certosa is a figure of God the Father with cherubim. An "Annunciation" has disappeared from cognisance; three compartments—the Virgin adoring the infant Christ, St Michael, and St Raphael with Tobias—are among the choicer treasures of the National Gallery, London. The current story that Raphael bore a hand in the work is not likely to be true. This was succeeded in 1505 by an "Assumption," in the Cappella dei Rabatta, in the church of the Servi in Florence. The painting may have been executed chiefly by a pupil, and was at any rate a failure: it was much decried; Perugino lost his scholars; and towards 1506 he once more and finally abandoned Florence, going to Perugia, and thence in a year or two to Rome.

Pope Julius II. had summoned Perugino to paint the Stanza in the Vatican, now called that of the Incendio del Borgo; but he soon preferred a younger competitor, that very Raphael who had been trained by the aged master of Perugia; and Vannucci, after painting the ceiling with figures of God the Father in different glories, in five medallion-subjects, found his occupation gone; he retired from Rome, and was once more in Perugia from 1512. Among his latest works one of the best is the extensive altar-piece (painted between 1512 and 1517) of S. Agostino in Perugia; the component parts of it are now dispersed in various galleries.

Perugino's last frescoes were painted for the monastery of S. Agnese in Perugia, and in 1522 for the church of Castello di Fortignano hard by. Both series have disappeared from their places, the second being now in the Victoria and Albert Museum. He was still at Fontignano in 1524 when the plague broke out, and he died. He was buried in unconsecrated ground in a field, the precise spot now unknown. The reason for so obscure and unwonted a mode of burial has been discussed, and religious scepticism on the painter's own part has been assigned as the cause; the fact, however, appears to be that, on the sudden and widespread outbreak of the plague, the panic-struck local authorities ordained that all victims of the disorder should be at once interred without any waiting for religious rites. This leads us to speak of Perugino's opinions on religion. Vasari is our chief, but not our sole, authority for saying that Vannucci had very little religion, and was an open and obdurate disbeliever in the immortality of the soul. For a reader of the present day it is easier than it was for Vasari to suppose that Perugino may have been a materialist, and yet just as good and laudable a man as his orthodox Catholic neighbours or brother-artists; still there is a strong discrepancy between the quality of his art, in which all is throughout Christian, Catholic, devotional, and even pietistic, and the character of an anti-Christian contemner of the doctrine of immortality. It is difficult to reconcile this discrepancy, and certainly not a little difficult also to suppose that Vasari was totally mistaken in his assertion; he was born twenty years before Perugino's death, and must have talked with scores of people to whom the Umbrian painter had been well known. We have to remark that Perugino in 1494 painted his own portrait, now in the Uffizi Gallery of Florence, and into this he introduced a scroll lettered "Timete Deum." That an open disbeliever should inscribe himself with "Timete Deum" seems odd. The portrait in question shows a plump face, with small dark eyes, a short but well-cut nose, and sensuous lips; the neck is thick, the hair bushy and frizzled, and the general air imposing. The later portrait in the Cambio of Perugia shows the same face with traces of added years. Perugino died possessed of considerable property, leaving three sons.

Among the very numerous works of Perugino a few not already named require mention. Towards 1496 he painted the "Crucifixion," in S. Maria Maddalena dei Pazzi, Florence. The attribution to him of the picture of the marriage of Joseph and the Virgin Mary (the "Sposalizio") now in the museum of Caen, which served indisputably as the original, to a great extent, of the still more famous "Sposalizio" which was painted by Raphael in 1504, and which forms a leading attraction of the Brera Gallery in Milan, is now questioned, and it is assigned to Lo Spagna. A vastly finer work of Perugino's is the "Ascension of Christ," which, painted a little earlier for S. Pietro of Perugia, has for years past been in the museum of Lyons; the other portions of the same altar-piece are dispersed in other galleries. In the chapel of the Disciplinati of Città della Pieve is an "Adoration of the Magi," a square of 21 ft. containing about thirty life-sized figures; this was executed, with scarcely credible celerity, from the 1st to the 25th of March (or thereabouts) in 1505, and must no doubt be in great part the work of Vannucci's pupils. In 1507, when the master's work had for years been in a course of decline and his performances were generally weak, he produced, nevertheless, one of his best pictures—the "Virgin between St Jerome and St Francis," now in the Palazzo Penna. In S. Onofrio of Florence is a much-lauded and much-debated fresco of the "Last Supper," a careful and blandly correct but not inspired work; it has been ascribed to Perugino by some connoisseurs, by others to Raphael; it may more probably be by some different pupil of the Umbrian master.

PERUKE, an artificial head of hair, a wig. The word is from Fr. *perruque*, an adaptation of Ital. *perruca* or *parrucca*. This is usually taken to be from Ital. *pelo*, hair; Lat. *pilus*. Span. *peluca*, wig, and Sardinian *pilucca*, lock or tuft of hair, support this view. In the 17th century the English forms which the French word took, such as *perruck* or *perug*, were corrupted into *perwyke*, and thence into *perewyk*, *perewig*, and lastly "periwig," which again was shortened into "wig," the

with nave and aisles, founded in the beginning of the 11th century by San Pietro Vincioli on the site of a building of the 6th century, and remarkable for its conspicuous spire, its ancient granite and marble columns, its walnut stall-work of 1535 by Stefano de' Zambelli da Bergamo, and its numerous pictures (by Perugino, &c.). The oratory of S. Bernardino has an early Renaissance polychrome façade, richly sculptured, of 1457–1461, by Agostino d'Antonio di Duccio of Florence. S. Severo contains Raphael's first independent fresco (1505), much damaged by restoration. The circular church of S. Angelo, with sixteen antique columns in the interior, probably dates from the middle of the 6th century. The university dates from 1307, and has faculties of law, science and medicine; it had 318 students in 1902–1903. It contains an important museum of Etruscan and Roman antiquities. Three miles to the S.S.E. the Etruscan necropolis of the ancient city was discovered in 1870. Some of his early works were extensive frescoes for the Ingesati fathers in their convent, which was destroyed not many years afterwards in the course of the siege of Florence; he produced for them also many cartoons, which they executed with brilliant effect in stained glass. Though greedy for gain, his integrity was proof against temptation; and an amusing anecdote has survived of how the prior of the Ingesati doled out to him the costly colour of ultramarine, and how Perugino, constantly washing his brushes, obtained a surreptitious hoard of the pigment, which he finally restored to the prior to shame his stingy suspiciousness. A good specimen of his early style in tempera is the circular picture in the Louvre of the "Virgin and Child enthroned between Saints."

Perugino returned from Florence to Perugia, and thence, towards 1483, he went to Rome. The painting of that part of the Sixtine Chapel which is now immortalized by Michelangelo's "Last Judgment" was assigned to him by the pope; he covered it with frescoes of the "Assumption," the "Nativity," and "Moses in the Bulrushes." These works were ruthlessly destroyed to make a space for his successor's more colossal genius, but other works by Perugino still remain in the Sixtine Chapel: "Moses and Zipporah" (often attributed to Signorelli), the "Baptism of Christ," and "Christ giving the Keys to Peter." Pinturicchio accompanied the greater Umbrian to Rome, and was made his partner, receiving a third of the profits; he may probably have done some of the Zipporah subject.

Pietro, now aged forty, must have left Rome after the completion of the Sixtine paintings in 1486, and in the autumn of that year he was in Florence. Here he figures by no means advantageously in a criminal court. In July 1487 he and another Perugian painter named Aulista di Angelo were convicted, on their own confession, of having in December waylaid with staves some one (the name does not appear) in the street near S. Pietro Maggiore. Perugino limited himself, in intention, to assault and battery, but Aulista had made up his mind for murder. The minor and more illustrious culprit was fined ten gold florins, and the major one exiled for life.

Between 1486 and 1499 Perugino resided chiefly in Florence, making one journey to Rome and several to Perugia. He was in many other parts of Italy from time to time. He had a regular shop in Florence, received a great number of commissions, and continued developing his practice as an oil-painter, his

half of the year by violent N.E. winds, and also lie full in the path of the numerous typhoons that rush up the Strait of Formosa. Meteorological observations taken by the Japanese during a period of three years show that the annual average number of stormy days is 237. The anchorage is at Mako (Makyū or Makun), on the principal island of Penghu. The chief industry is fishing (whence the old Spanish name which has come into general use) and dried fish are exported.

PESCARA, FERNANDO FRANCESCO DAVALOS, Marquis of (1489–1525), Italian *condottiere*, was born at Naples, his family being of Spanish origin. Rodrigo (Ruy) Lopez Davalos, his great-grandfather, a noble of Toledo, who had taken an active part in the civil wars of Castile in the reign of John II. (1407–1454), had been driven into exile, and died at Valencia. Iñigo (Ignatius), his son, entered the service of Alphonso of Aragon and Naples, followed his master to Italy, and there, making an advantageous marriage with a lady of the family of Aquino, was created marquis of Pescara. His son Alphonso, who succeeded him in the marquisate, married a lady of the Sicilian branch of the Spanish family of Cardona, and when he was treacherously killed, during a French invasion of Naples, his only son Fernando, or Ferrante, was a child in arms. At the age of six the boy was betrothed to Vittoria Colonna (*q.v.*), daughter of the general Fabrizio Colonna, and the marriage was celebrated in 1509. His position as a noble of the Aragonese party in Naples made it incumbent on him to support Ferdinand the Catholic in his Italian wars. In 1512 he commanded a body of light cavalry at the battle of Ravenna, where he was wounded and taken prisoner by the French. Thanks to the intervention of one of the foremost of the French generals, the Italian J. J. Trivulzio, who was his connexion by marriage, he was allowed to ransom himself for 6000 ducats. He commanded the Spanish infantry at the battle of La Morta, or Vicenza, on the 7th of October 1513. It was on this occasion that he called his men before the charge to take care to step on him before the enemy did if he fell. From the battle of Vicenza in 1513, down to the battle of La Bicocca on the 29th of April 1522, he continued to serve in command of the Spaniards and as the colleague rather than the subordinate of Prosper Colonna. It was only by the accident of his birth at Naples that Pescara was an Italian. He considered himself a Spaniard, spoke Spanish at all times, even to his wife, and was always surrounded by Spanish soldiers and officers. His opinion of the Italians as fighting men was unfavourable and was openly expressed. After the battle of La Bicocca Charles V. appointed Prosper Colonna commander-in chief. Pescara, who considered himself aggrieved, made a journey to Valladolid in Spain, where the emperor then was, to state his own claims. Charles V., with whom he had long and confidential interviews, persuaded him to submit for the time to the superiority of Colonna. But in these meetings he gained the confidence of Charles V. His Spanish descent and sympathies marked him out as a safer commander of the imperial troops in Italy than an Italian could have been. When Francis I. invaded Italy in 1524 Pescara was appointed as lieutenant of the emperor to repel the invasion. The difficulties of his position were very great, for there was much discontent in the army, which was very ill paid. The tenacity, patience and tact of Pescara triumphed over all obstacles. His influence over the veteran Spanish troops and the German mercenaries kept them loyal during the long siege of Pavia. On the 24th of February 1525 he defeated and took prisoner Francis I. by a brilliant attack. Pescara's plan was remarkable for its audacity and for the skill he showed in destroying the superior French heavy cavalry by assailing them in flank with a mixed force of harquebusiers and light horse. It was believed that he was dissatisfied with the treatment he had received from the emperor; and Girolamo Morone, secretary to the duke of Milan, approached him with a scheme for expelling French, Spaniards and Germans alike from Italy, and for gaining a throne for himself. Pescara may have listened to the tempter, but in act he was loyal. He reported the offer to Charles V. and put Morone into prison. His health, however, had begun to give way under the strain of wounds and exposure; and he died at Milan on the 4th of November 1525. Pescara had no children; his title descended to his cousin the marquis del Vasto, also a distinguished imperial general.

Authorities.—The life of Pescara was written in Latin by Paolo Giovio, and is included in the *Vitae illustrium virorum*, printed at Basel, 1578. Giovio's Latin *Life* was translated by L. Domenichi, the translator of his other works, and published at Florence, 1551. The Spanish *Historia del fortissimo y prudentissimo capitan Don Hernando de Avalos*, by El Maestro P. Vallés (Antwerp, 1553), is also a translation of Giovio. See also Mignet, *Rivalité de François Ier et de Charles Quint* (Paris, 1875), which gives references to all authorities. (D. H.)

PESCARA, a river of Italy, formed by the confluence of the Gizio and Aterno, and flowing into the Adriatic at the small town of Pescara. This town occupies the site of the ancient Aternum, the terminus of the Via Claudia Valeria, and up to 1867 a fortress of some importance. The railway from Sulmona follows the Pescara valley and joins the coast-line to Brindisi at Pescara. In this valley, 22 m. from the sea, was the site of the ancient Interpromium, a town belonging probably to the Paeligni; and not far off is the very fine Cistercian abbey church of S. Clemente di Casauria, founded by the emperor Louis II. in 871. The present building belongs to the 12th century. The sculptures of the portals, the pulpit, the Paschal candelabrum, &c., and the bronze doors of this period are important. The chronicle of the abbey, of the end of the 12th century, is in the Bibliothèque Nationale at Paris.

See V. Bindi, *Monumenti degli Abruzzi* (Naples, 1889), pp. 405 sqq.; P. L. Calore in *Archivio storico dell' arte* (Rome, 1891), iv. 9 sqq.

PESCHIERA SUL GARDA, a fortress of Venetia, Italy, in the province of Verona, on an island in the Mincio at its outlet from the lake of Garda, 77 m. by rail E. of Milan. It was one of the famous fortresses of the Quadrilateral, the chief bulwark of the Austrian rule in Italy until 1866 (Mantua, Legnago and Verona being the other three), and has played a prominent part in all the campaigns conducted in north Italy, more especially during the Napoleonic wars. It was taken by the Piedmontese from the Austrians, after a gallant defence by General Rath lasting six weeks, on the 30th of May 1848, and since that date has been in Italian hands.

PESCIA, a town of Tuscany, Italy, in the province of Lucca, from which it is 15 m. E.N.E. by rail, 203 ft. above sea-level. Pop. (1901), 12,400 (town); 18,000 (commune). The cathedral, restored in 1693, contains the fine chapel of the Turini family, built for Baldassare Turini (d. 1540) by Giuliano di Baccio of Florence, with his tomb by Raffaello da Montelupo. The town also has some buildings by Lazzaro Buggiano, the pupil and adoptive son of Brunelleschi. It has silk and paper manufactures.

PESETA, a silver coin and unit of value, the Spanish equivalent of the French, Belgian and Swiss *franc*, the Italian *lira* and the Greek *drachma* in the Latin monetary union. The *peso* (Lat. *pensum*, weight), of which *peseta* is a diminutive, was a Spanish coin of gold, *peso de oro*, or silver, *peso de plata*, once current in Spain and her colonies, and now the name of a silver coin of many South American states. The *peso* is also the name of the Mexican dollar.

PESHAWAR, a city of British India, the capital of the North-West Frontier Province, giving its name to a district. The city is situated near the left bank of the river Bara, 11 m. from Jamrud at the entrance of the Khyber Pass, the railway station being 1588 m. north-west of Calcutta; pop. (1901), 95,147. Two miles west of the native city are the cantonments, forming the principal military station of the North-West Frontier Province. Peshawar lies within a horseshoe ring of hills on the edge of the mountain barrier which separates India from Afghanistan, and through it have passed nearly all the invaders from the north. The native quarter is a huddle of flat-roofed houses within mud walls, crowded along narrow, crooked alleys; there is but one fairly wide street of shops. Here for many centuries the *Povindahs*, or Afghan travelling merchants, have brought their caravans from Kabul, Bokhara and Samarkand every autumn. They

with nave and aisles, founded in the beginning of the 11th century by San Pietro Vincioli on the site of a building of the 6th century, and remarkable for its conspicuous spire, its ancient granite and marble columns, its walnut stall-work of 1535 by Stefano de' Zambelli da Bergamo, and its numerous pictures (by Perugino, &c.). The oratory of S. Bernardino has an early Renaissance polychrome façade, richly sculptured, of 1457–1461, by Agostino d'Antonio di Duccio of Florence. S. Severo contains Raphael's first independent fresco (1505), much damaged by restoration. The circular church of S. Angelo, with sixteen antique columns in the interior, probably dates from the middle of the 6th century. The university dates from 1307, and has faculties of law, science and medicine; it had 318 students in 1902–1903. It contains an important museum of Etruscan and Roman antiquities. Three miles to the S.S.E. the Etruscan necropolis of the ancient city was discovered in 1870. The large tomb of the Volumni (3rd century B.C.) hewn in the rock, with its carved cinerary urns, is interesting.

The ancient Perusia first appears in history as one of the twelve confederate cities of Etruria. It is first mentioned in the account of the war of 310 or 309 B.C. between the Etruscans and the Romans. It took, however, an important part in the rebellion of 295, and was reduced, with Vulsinii and Arretium, to seek for peace in the following year. In 216 and 205 it assisted Rome in the Hannibalic war, but afterwards it is not mentioned until 41–40 B.C., when L. Antonius took refuge there, and was reduced by Octavian after a long siege. A number of lead bullets used by slingers have been found in and around the city (*Corpus inscr. lat.* xi. 1212). The city was burnt, we are told, with the exception of the temples of Vulcan and Juno —the massive Etruscan terrace-walls, naturally, can hardly have suffered at all—and the town, with the territory for a mile round, was allowed to be occupied by whoever chose. It must have been rebuilt almost at once, for several bases exist, inscribed *Augusto sacr(um) Perusia restituta*; but, as we have seen, it did not become a colony until A.D. 251–253. It is hardly mentioned except by the geographers until the middle of the 6th century, when it was captured by Totila after a long siege. In the Lombard period it is spoken of as one of the principal cities of Tuscia. In the 9th century, with the consent of Charles the Great and Louis the Pious, it passed under the popes; but for many centuries the city continued to maintain an independent life, warring against many of the neighbouring lands and cities—Foligno, Assisi, Spoleto, Montepulciano, &c. It remained true for the most part to the Guelphs. On various occasions the popes found asylum within its walls, and it was the meeting-place of the conclaves which elected Honorius II. (1124), Honorius IV. (1285), Celestine V. (1294), and Clement V. (1305). But Perugia had no mind simply to subserve the papal interests. At the time of Rienzi's unfortunate enterprise it sent ten ambassadors to pay him honour; and, when papal legates sought to coerce it by foreign soldiers, or to exact contributions, they met with vigorous resistance. In the 15th century power was at last concentrated in the Baglioni family, who, though they had no legal position, defied all other authority. Gian Paolo Baglioni was lured to Rome in 1520 and beheaded by Leo X.; and in 1534 Rodolfo, who had slain a papal legate, was defeated by Pier Luigi Farnese, and the city, captured and plundered by his soldiery, was deprived of its privileges. The citadel was begun six years later "ad coercendam Perusinorum audaciam." In 1797 Perugia was occupied by the French; in 1832, 1838 and 1854 it was visited by earthquakes; in May 1849 it was seized by the Austrians; and, after a futile insurrection in 1859, it was finally united, along with the rest of Umbria, to Piedmont, in 1860.

See G. Conestabile, *I Monumenti di Perugia etrusca e romana* (Perugia, 1855); M. Symonds and L. Duff Gordon, *Perugia* ("Medieval Towns Series") (1898); R. A. Gallenga Stuart, *Perugia* (Bergamo, 1905); W. Heywood, *Hist. of Perugia* (1910). (T. As.)

PERUGINO, PIETRO (1446–1524), whose correct family name was VANNUCCI, Italian painter, was born in 1446 at Città della Pieve in Umbria, and belongs to the Umbrian school of painting. The name of Perugino came to him from Perugia, the chief city of the neighbourhood. Pietro was one of several children born to Cristoforo Vannucci, a member of a respectable family settled at Città della Pieve. Though respectable, they seem to have been poor, or else, for some reason or other, to have left Pietro uncared for at the opening of his career. Before he had completed his ninth year the boy was articled to a master, a painter at Perugia. Who this may have been is very uncertain; the painter is spoken of as wholly mediocre, but sympathetic for the great things in his art. Benedetto Bonfigli is generally surmised; if he is rejected as being above mediocrity, either Fiorenzo di Lorenzo or Niccolò da Foligno may possibly have been the man. Pietro painted a little at Arezzo; thence he went to the headquarters of art, Florence, and frequented the famous Brancacci Chapel in the church of the Carmine. It appears to be sufficiently established that he studied in the atelier of Andrea del Verrocchio, where Leonardo da Vinci was also a pupil. He may have learned perspective, in which he particularly excelled for that period of art, from Piero de' Franceschi. The date of this first Florentine sojourn is by no means settled; some authorities incline to make it as early as 1470, while others, with perhaps better reason, postpone it till 1479. Pietro at this time was extremely poor; he had no bed, but slept on a chest for many months, and, bent upon making his way, resolutely denied himself every creature comfort.

Gradually Perugino rose into notice, and became famous not only throughout Italy but even beyond. He was one of the earliest Italian painters to practise oil-painting, in which he evinced a depth and smoothness of tint, which elicited much remark; and in perspective he applied the novel rule of two centres of vision. Some of his early works were extensive frescoes for the Ingesati fathers in their convent, which was destroyed not many years afterwards in the course of the siege of Florence; he produced for them also many cartoons, which they executed with brilliant effect in stained glass. Though greedy for gain, his integrity was proof against temptation; and an amusing anecdote has survived of how the prior of the Ingesati doled out to him the costly colour of ultramarine, and how Perugino, constantly washing his brushes, obtained a surreptitious hoard of the pigment, which he finally restored to the prior to shame his stingy suspiciousness. A good specimen of his early style in tempera is the circular picture in the Louvre of the "Virgin and Child enthroned between Saints."

Perugino returned from Florence to Perugia, and thence, towards 1483, he went to Rome. The painting of that part of the Sixtine Chapel which is now immortalized by Michelangelo's "Last Judgment" was assigned to him by the pope; he covered it with frescoes of the "Assumption," the "Nativity," and "Moses in the Bulrushes." These works were ruthlessly destroyed to make a space for his successor's more colossal genius, but other works by Perugino still remain in the Sixtine Chapel: "Moses and Zipporah" (often attributed to Signorelli), the "Baptism of Christ," and "Christ giving the Keys to Peter." Pinturicchio accompanied the greater Umbrian to Rome, and was made his partner, receiving a third of the profits; he may probably have done some of the Zipporah subject.

Pietro, now aged forty, must have left Rome after the completion of the Sixtine paintings in 1486, and in the autumn of that year he was in Florence. Here he figures by no means advantageously in a criminal court. In July 1487 he and another Perugian painter named Aulista di Angelo were convicted, on their own confession, of having in December waylaid with staves some one (the name does not appear) in the street near S. Pietro Maggiore. Perugino limited himself, in intention, to assault and battery, but Aulista had made up his mind for murder. The minor and more illustrious culprit was fined ten gold florins, and the major one exiled for life.

Between 1486 and 1499 Perugino resided chiefly in Florence, making one journey to Rome and several to Perugia. He was in many other parts of Italy from time to time. He had a regular shop in Florence, received a great number of commissions, and continued developing his practice as an oil-painter, his

regarded. The advent of Christianity, with its categorical assertion of future happiness for the good, to a large extent did away with pessimism in the true sense. In Leibnitz we find a philosophic or religious optimism, which saw in the universe the perfect work of a God who from all possibilities selected the best. Kant, though pessimistic as regards the actual man, is optimistic regarding his moral capacity. To Hegel similarly the world, though evil at any moment, progresses by conflict and suffering towards the good.

Passing over the Italian Leopardi we may notice two leading modern pessimists, Schopenhauer and von Hartmann. Schopenhauer emphasizes the pessimistic side of Hegel's thought. The universe is merely blind Will, not thought; this Will is irrational, purposeless and therefore unhappy. The world being a picture of the Will is therefore similarly unhappy. Desire is a state of unhappiness, and the satisfaction of desire is therefore merely the removal of pain. Von Hartmann's doctrine of the Unconscious is in many respects similar to Schopenhauer's doctrine of the Will. The Unconscious which combines Will and Reason is, however, primarily Will. The workings of this Will are irrational primarily, but, as in its evolution it becomes more rationalized and understands the whole meaning of the Weltschmerz, it ultimately reaches the point at which the desire for existence is gone. This choice of final nothingness differs from that of Schopenhauer in being collective and not individual. The pessimism of Schopenhauer and Hartmann does not, however, exclude a certain ultimate mysticism, which bears some analogy to that of Buddhism.

Pessimism is naturally connected with materialist, optimism with idealist, views of life. The theories of the modern evolutionist school, however, have introduced into materialistic theory a new optimistic note in doctrines such as that of the survival of the fittest. Such doctrines regard the progress of humanity as on the whole tending to the greater perfection, and are markedly optimistic in contrast with earlier theories that progressive differentiation is synonymous with progressive decay. Similarly the cynical contempt which Nietzsche shows for morality and the conventional virtues is counterbalanced by the theory of the *Übermensch*, the highest type of manhood which by struggle has escaped from the ordinary weaknesses of normal humanity.

See James Sully, *Pessimism: A History and a Criticism* (1877); Caro, *Le Pessimisme au xix^e siècle* (1878); Saltus, *The Anatomy of Negation* (1886); Tulloch, *Modern Theories on Philosophy and Religion* (1884); William James, *The Will to Believe*; Dühring, *Der Werth des Lebens* (1865); Meyer, *Weltelend und Weltschmerz* (1872); E. Pfleiderer, *Der moderne Pessimismus* (1875); Agnes Taubert (Hartmann), *Der Pessimismus und seine Gegner* (1873); Gass, *Optimismus und Pessimismus* (1876); Rehmke, *Die Philos. des Weltschmerzes* (1876); Huber, *Der Pessimismus* (1876); von Golther, *Der moderne P.* (1878); Paulsen, *Schopenhauer, Hamlet, Mephistopheles* (1900); Kowalewski, *Studien zur Psychologie des P.* (1904).

PESSINUS (Πεσσινοῦς, Πεσινοῦς), an ancient city of Galatia in Asia Minor, situated on the lowest southern slope of Mt Dindymus, on the left bank of the river Sangarius, not far from its source. The ruins, discovered by Texier, lie round the village of Bala-Hissar, 8 or 9 m. S.E. of Sivri-Hissar. They include a theatre in partial preservation, but they have been mostly carried off to Sivri-Hissar, which is largely built out of them. Originally a Phrygian city, probably on the Persian "Royal Road," it became the capital of the Gallic tribe Tolistobogii and the chief commercial city of the district. It contained the most famous sanctuary of the mother of the gods (Cybele), who here went by the name of Agdistis, and was associated with the god Attis, as elsewhere with Sabazius, &c. Her priests were also princes, who bore rule not only in the city (the coinage of which, beginning about 100 B.C., was for long issued by them) but also in the country round, deriving a large revenue from the temple estates; but in the time of Strabo (A.D. 19–20) their privileges were much diminished. The high-priest always bore the god's name Attis. In the crisis of the second Punic War (205 B.C.), when the Romans lost faith in the efficacy of their own religion to save the state, the Senate, in compliance with an oracle in the Sibylline books to the effect that the foreign foe could be driven from Italy if the Idaean Mother (Cybele) were brought from Pessinus to Rome, sent ambassadors to the town, who obtained the sacred stone which was the symbol of the goddess and brought it to Rome, where the worship of Cybele was established. But the goddess continued to be worshipped in her old home; her priests, the Galli, went out to welcome Manlius on his march in 189 B.C., which shows that the town was not yet in the hands of the Tolistobogii. Soon after this a splendid new temple of the goddess was built by the Pergamenian kings. Some time before 164 B.C. Pessinus fell into the power of the Gauls, and the membership of the priestly college was then equally divided between the Gauls and the old priestly families. Like Ancyra and Tavium, Pessinus was Romanized first and Hellenized afterwards. Only about A.D. 165 did Hellenic ways and modes of thought begin to be assumed; before that we find a deep substratum of Celtic feeling and ways, on which Roman elements had been superimposed without filtering through a Hellenic medium. Christianity was introduced late; it cannot be traced before the 4th century. When Galatia was divided into two provinces (A.D. 386–395) Pessinus was made the capital of Galatia Secunda or Salutaris, and it became a metropolitan bishopric. After the 6th century it disappears from history, being supplanted, from the beginning of the period of Saracen invasion, by the impregnable fortress Justinianopolis (Sivri-Hissar), which became the capital and the residence of the bishop, thenceforward called "archbishop of Pessinus or of Justinianopolis." (J. G. C. A.)

PESTALOZZI, JOHANN HEINRICH (1746–1827), Swiss educational reformer, was born at Zürich on the 12th of January 1746. His father died when he was young, and he was brought up by his mother. At the university of Zürich he was associated with Lavater and the party of reform. His earliest years were spent in schemes for improving the condition of the people. The death of his friend Bluntschli turned him however from politics, and induced him to devote himself to education. He married at twenty-three and bought a piece of waste land at Neuhof in Aargau, where he attempted the cultivation of madder. Pestalozzi knew nothing of business, and the plan failed. Before this he had opened his farm-house as a school; but in 1780 he had to give this up also. His first book published at this time was *The Evening Hours of a Hermit* (1780), a series of aphorisms and reflections. This was followed by his masterpiece, *Leonard and Gertrude* (1781), an account of the gradual reformation, first of a household, and then of a whole village, by the efforts of a good and devoted woman. It was read with avidity in Germany, and the name of Pestalozzi was rescued from obscurity. The French invasion of Switzerland in 1798 brought into relief his truly heroic character. A number of children were left in Canton Unterwalden on the shores of the Lake of Lucerne, without parents, home, food or shelter. Pestalozzi collected a number of them into a deserted convent, and spent his energies in reclaiming them. During the winter he personally tended them with the utmost devotion, but in June 1799 the building was required by the French for a hospital, and his charges were dispersed. In 1801 Pestalozzi gave an exposition of his ideas on education in the book *How Gertrude teaches her Children*. His method is to proceed from the easier to the more difficult. To begin with observation, to pass from observation to consciousness, from consciousness to speech. Then come measuring, drawing, writing, numbers, and so reckoning. In 1799 he had been enabled to establish a school at Burgdorf, where he remained till 1804. In 1802 he went as deputy to Paris, and did his best to interest Napoleon in a scheme of national education; but the great conqueror said that he could not trouble himself about the alphabet. In 1805 he removed to Yverdun on the Lake of Neuchâtel, and for twenty years worked steadily at his task. He was visited by all who took interest in education—Talleyrand, Capo d'Istria, and Mme de Stael. He was praised by Wilhelm von Humboldt and by Fichte. His pupils included Ramsauer, Delbrück, Blochmann, Carl Ritter, Fröbel and Zeller. About 1815 dissensions broke out among the teachers of the school, and Pestalozzi's last ten years were

chequered by weariness and sorrow. In 1825 he retired to Neuhof, the home of his youth; and after writing the adventures of his life, and his last work, the *Swan's Song*, he died at Brugg on the 17th of February 1827. As he said himself, the real work of his life did not lie in Burgdorf or in Yverdun. It lay in the principles of education which he practised, the development of his observation, the training of the whole man, the sympathetic application of the teacher to the taught, of which he left an example in his six months' labours at Stanz. He had the deepest effect on all branches of education, and his influence is far from being exhausted.

Pestalozzi's complete works were published at Stuttgart in 1819–1826, and an edition by Seyffarth appeared at Berlin in 1881. Volumes on his life and teaching have been written by De Guimps (1889), Barnard (1862), Krüsi (1875) and Pinloche (1901).

PETALITE, a mineral species consisting of lithium aluminium silicate, $LiAl(Si_2O_5)_2$. The monoclinic crystals approach spodumene (*q.v.*) in form, which is also a lithium aluminium silicate with the formula $LiAl(SiO_3)_2$. There is a perfect cleavage parallel to the basal plane, and the mineral usually occurs in platy cleavage masses; on this account it was named, from Gr. πέταλον (a leaf). The hardness is 6½ and the specific gravity 2·4 (that of spodumene being 3·16). The mineral is colourless or occasionally reddish, varies from transparent to translucent, and has a vitreous lustre. It was discovered in 1800 as cleavage masses in an iron mine on the island of Utö in the Stockholm archipelago, where it is associated with lepidolite, tourmaline (rubellite and indicolite) and spodumene. A variety known as "castor" is found as transparent glassy crystals associated with pollux (*q.v.*) in cavities in the granite of Elba. (L. J. S.)

PETARD (Fr. *pétard, péter*, to make a slight explosion), a device formerly used by military engineers for blowing in a gate or other barrier. It consisted of a small metal or wooden case, usually of sugar-loaf shape, containing a charge of powder and fired by a fuse.

PETAU, DENYS (1583–1652), Jesuit scholar, better known as DIONYSIUS PETAVIUS, was born at Orleans on the 21st of August 1583. Educated at Paris University, he came under the influence of Isaac Scaliger, who directed his attention towards the obscurer fathers of the Church. In 1603 he was appointed to a lectureship at the university of Bourges, but resigned his place two years later, in order to enter the Society of Jesus. For many years he was professor of divinity at the Collège de Clermont, the chief Jesuit establishment in Paris; there he died on the 11th of December 1652. He was one of the most brilliant scholars in a learned age. Carrying on and improving the chronological labours of Scaliger, he published in 1627 an *Opus de doctrina temporum*, which has been often reprinted. An abridgment of this work, *Rationarium temporum*, was translated into French and English, and has been brought down in a modern reprint to the year 1849. But Petau's eminence chiefly rests on his vast, but unfinished, *De theologicis dogmatibus*, the first systematic attempt ever made to treat the development of Christian doctrine from the historical point of view.

PETCHENEGS, or PATZINAKS, a barbarous people, probably of Turkish race, who at the end of the 9th century were driven into Europe from the lower Ural, and for about 300 years wandered about the northern frontier of the East Roman Empire. (See TURKS.)

PETER (Lat. *Petrus* from Gr. πέτρος, a rock, Ital. *Pietro, Piero, Pier*, Fr. *Pierre*, Span. *Pedro*, Ger. *Peter*, Russ. *Petr*), a masculine name, derived from the famous surname bestowed by Christ upon his apostle Simon ("Thou art Peter and upon this rock will I build my church," Matt. xiv. 17–19). The name has consequently been very popular in Christian countries. It is noteworthy, however, that, out of deference to the "prince of the apostles" and first bishop of Rome, the name has never been assumed by a pope. The biographies which follow are arranged in the order: (1) the apostle; (2) kings; (3) other eminent men.

PETER, ST, the chief of the Twelve Apostles. He is known also by other names: (*a*) "Simon" (Σίμων) in Mark four times and Luke seven times. This use is only found in narrative before the story of the mission of the apostles: it is also found in speeches; Matthew once, Mark once, and Luke twice. (*b*) "Simon who is called Peter" is found in Matthew twice and Acts four times. (*c*) "Simon Peter" is found in Matthew once, Luke once, John seventeen times (and perhaps also in 2 Peter i. 1, where the text varies between Simon and Symeon. (*d*) "Peter" is found in Matthew nineteen times, Mark eighteen times, Luke sixteen times, Acts fifty-one times, John fifteen times, Galatians twice, 1 Peter once. (*e*) "Cephas" is found in John once, Galatians four times, 1 Corinthians four times. (*f*) Symeon (Συμεών) is found in Acts once. It appears that the apostle had two names, each existing in a double form—Greek and Hebrew, Symeon (שִׁמְעוֹן) which was Graecized according to the sound into Simon, and Cephas (כֵּיפָא) which was Graecized according to the meaning into Peter (Πέτρος). Symeon and Simon are both well-known names in Aramaic and Greek respectively, but Cephas and Peter are previously unknown. Symeon was no doubt his original Aramaic name, and the earliest gospel, Mark, which has some claim specially to reproduce Petrine tradition, is careful to employ Simon until after the name Peter had been given, and not then to use it again. The Gospels agree in regarding Cephas or Peter as an additional name, which was given by Christ. But they differ as to the occasion. According to Mark iii. 13 sqq. it was given on the occasion of the mission of the Twelve. According to John i. 42 it was given at his first call. According to Matt. xvi. 13 sqq. it was given after the recognition of Jesus as Messiah at Caesarea Philippi. This last account is the only one which describes any circumstances (for a further discussion see § 3 (2) below).

According to the Gospels Peter was the son of John (Ἰωάνης, John i. 42, xxi. 15 seq.) or Jonas (Ἰωνᾶς, Matt. xxvi. 17). According to Mark i. 29 he was a fisherman of Capernaum, but John i. 44 describes him and his brother Andrew as of Bethsaida. From Mark i. 30 he is seen to have been married, and 1 Cor. ix. 5 suggests (but another interpretation is possible) that his wife went with him on his missionary journeys. In 1 Pet. v. 13 Mark is referred to as his son, but this is usually interpreted of spiritual kinship. According to legend (*Acta Nerei et Achillei*, and *Acta Philippi*) he had a daughter Petronilla, but there is no reason for thinking that this is historical.

History in the Gospels up to the Resurrection.

The Gospel narratives are unanimous in describing Peter as one of the first disciples of Christ, and from the time of his call he seems to have been present at most of the chief incidents in the narrative. He formed together with the sons of Zebedee to some extent an inner circle within the Twelve, and this favoured group is specially mentioned as present on three occasions—the raising of the daughter of Jairus (Mark v. 22–43; Matt. ix. 18–36; Luke viii. 41–56), the transfiguration (Mark ix. 2 sqq.; Matt. xvii. 1 sqq.; Luke ix. 28 sqq.) and the scene in the Garden at Gethsemane (Mark xiv. 32 sqq.; Matt. xxvi. 36 sqq.). He is also specially mentioned in connexion with his call (Mark i. 16–20; Matt. iv. 18 sqq.; Luke v. 1 sqq.; John i. 40 sqq.); the healing of his wife's mother (Mark i. 21 sqq.; Matt. viii. 14 sqq.; Luke iv. 38 sqq.); the mission of the Twelve Apostles (Mark iii. 13 sqq.; Matt. x. 1 sqq.; Luke vi. 12 sqq.); the storm on the Lake of Galilee (Mark vi. 45 sqq.; Matt. xiv. 22 sqq.; John vi. 16 sqq.); the Messianic recognition at Caesarea Philippi (Mark vii. 27 sqq.; Matt. xvi. 16 sqq.; Luke ix. 18 sqq.); the incident of the payment of tribute by the coin found in the fish caught by Peter (Matt. xvii. 25 sqq.) and with various questions leading to parables or their explanations (Mark xiii. 36 sqq.; Luke xii. 41; Matt. xviii. 21 sqq.; Mark x. 28; Matt. xix. 27; Luke xviii. 28). In the week of the Passion he appears in connexion with the incident of the withered fig-tree (Mark xi. 21; Matt. xxi. 20); as introducing the eschatological discourse (Mark xiii. 3 sqq.); and as prominent during the Last Supper (Luke xxii. 8 sqq.; John xiii. 4 sqq.; Mark xiv. 27 sqq.; Matt. xxvi. 31 sqq.). He

was present in Gethsemane, and tried to offer some resistance to the arrest of Jesus (Mark xiv. 47; Matt. xxvi. 51; Luke xxii. 50; John xviii. 10). After the arrest he followed the Lord to the scene of the trial, but denied him and fled. The message of the young man at the tomb (Mark xvi. 4) was especially addressed to Peter, and it is clear that the genuine conclusion of Mark must have contained an account of an appearance of the risen Lord to him.

Out of this mass of incidents the following are central and call for closer critical consideration.

1. *The Call of St Peter.*—(Mark i. 16–20; Matt. iv. 18–22; Luke v. 1–11; John i. 40–42.) The account in Matthew is practically identical with that in Mark and is no doubt taken from the Marcan source, but Luke and John have different traditions. The main points are as follow: according to Mark, at the beginning of the Galilean ministry Jesus saw Peter and Andrew fishing. He called them, and they joined him. After this he went with them to Capernaum, preached in the synagogue, and healed Peter's wife's mother. Luke, who certainly used Mark, has partly rearranged this narrative and partly rejected it in favour of a different version. According to him the visit to Capernaum and the healing of the wife's mother preceded the call of Peter, and this was associated with a tradition of a miraculous draught of fishes. The advantage of the Lucan reconstruction, so far as the first part is concerned, is that it supplies a reason for Peter's ready obedience, which is somewhat difficult to understand if he had never seen Jesus before. But it seems probable that this is the motive which led to the redactorial change in Luke, and that the Marcan account, which is traditionally connected with Peter, ought to be followed. With regard to the narrative of the miraculous draught of fishes, the matter is more complicated. Luke obviously preferred this narrative to the Marcan account, but the fact that the same story comes in John xxi. suggests that there was an early tradition of some such incident of which the actual occasion and circumstances were undetermined. Luke preferred to connect it with the call of Peter, the writer of John xxi. with his restitution: probably both are of the nature of redactorial guesses, and the Marcan account must be regarded as preferable to either. The Johannine account of the call of Peter is quite different. According to this it took place immediately after the baptism of Jesus, in Judaea not in Galilee. It is connected with the giving of the name Peter, which in Mark was not given until much later.

2. *The Confession of Peter at Caesarea Philippi.*—(Mark viii. 27–33; Matt. xvi. 13–23; Luke ix. 18–22.) According to Mark, Peter, in answer to the question of Jesus, recognized that He was the Messiah, but protested against the prophecy of suffering which Jesus then added. This narrative is followed, with the exception of the last part, by Luke, who as usual is inclined to omit anything which could be regarded as derogatory to the Apostles. Matthew also uses the Marcan narrative, but adds to it a new section from some other source which suggests that the name of Peter was conferred on this occasion—not, as Mark says, at the first mission of the Twelve—and confers on him the keys of the kingdom of heaven and the right of binding and loosing. This must be probably[1] interpreted as a reference to the prophecy concerning Eliakim in Isa. xxii. 22, and to technical use of the words "binding" and "loosing" by the scribes in authoritative decisions as to the obligations of the law. It thus confers on Peter a position of quite unique authority. It must, however, be noted that the power of binding and loosing is given in Matt. xviii. 18 to the whole body of disciples. This seems to be an alternative version, also found only in Matthew. The question of the historical character of the Matthaean addition to the Marcan narrative is exceedingly difficult; but it is hard to think that if it were really authentic it would have been omitted from all the other gospels, and it perhaps belongs to the little group of passages in Matthew which seem to represent early efforts towards church legislation, rather than a strictly historical narrative. Besides it is noticeable that in one other point Matthew has slightly remodelled the Marcan narrative. According to the latter Jesus asked, "Whom say men that I am?" and Peter replied "the Messiah," without qualification. But in Matthew the question is changed into "Whom say men that the Son of Man is?" and, whatever may be the original meaning of the phrase "the son of man" it cannot be doubted that in the gospels it means Messiah. Thus the simple answer of Peter in Mark would be meaningless, and it is replaced by "The Messiah, the son of the living God," which is no longer a recognition of the Messiahship of Jesus (this is treated in Matthew as an already recognized fact, cf. x. 23, xii. 40, &c.), but is a definition and an exaltation of the nature of the Messiah.

3. *The Conduct of Peter after the Betrayal.*—The consideration of this point brings one into touch with the two rival traditions as to the conduct of the disciples after the betrayal and crucifixion of the Lord—the Galilean and the Jerusalem narratives. There is one incident which must in any case be accepted as it is found in both narratives. This is the denial of Peter. It appears that Peter did not stay with the disciples and neither returned home immediately to Galilee (according to the Galilean tradition) nor sought hiding in Jerusalem (according to the Jerusalem tradition), but followed the Lord at a distance and was a witness of at least part of the trial before the Sanhedrim. He was detected and accused of being a disciple, which he denied, and so fulfilled the prophecy of Jesus that he would deny Him before the cock crowed.

But putting this incident aside, the Galilean and Jerusalem traditions do not admit of reconciliation with one another. The former is represented by Mark. According to it the disciples all fled after the betrayal (though Peter waited until after the denial), and afterwards saw the risen Lord in Galilee. The details of this narrative are unfortunately lost, as the genuine conclusion of Mark is not extant. But Mark xiv. 28 and xvi. 7 clearly imply a narrative which described how the disciples returned to Galilee, there saw the risen Lord, and perhaps even how they then returned to Jerusalem in the strength of their newly recovered faith, and so brought into existence the church of Jerusalem as we find it in the Acts. It is also clear from Mark xvi. 7 that Peter was in some special way connected with this appearance of the risen Lord, and this tradition is confirmed by 1 Cor. xv. 5, and perhaps by Luke xxiv. 34.

The Jerusalem narrative is represented especially by Luke and John (excluding John xxi. as an appendix). According to this the disciples, though they fled at the betrayal, did not return to their homes, but remained in Jerusalem, saw the risen Lord in that city, and stayed there until after the day of Pentecost. Attempts to reconcile these two narratives seem to be found in Matthew and in John xxi.

Obviously the choice which has to be made between these traditions cannot be adequately discussed here: it must suffice to say that intrinsic and traditional probability seem to favour the Galilean narrative. If so, one must say that after the denial Peter returned to Galilee—probably to resume his trade of fishing—and he there saw the risen Lord. This appearance is referred to in 1 Cor. xv. 5, and was certainly described in the lost conclusion of Mark. An account of it is preserved in John xxi., but it is here connected—probably wrongly—with a miraculous draught of fishes, just as the account of his call is in Luke.

History after the Resurrection according to the Acts and Epistles.

Immediately after the resurrection there is a missing link in the history of Peter. We know that he saw the risen Lord, and, according to the most probable view, that this was in Galilee; but the circumstances are unknown, and we have no account of his return to Jerusalem, as at the beginning of the Acts the disciples are all in Jerusalem, and the writer, in contradiction to the Marcan or Galilean narrative, assumes that they had never left it. The first part of the Acts is largely concerned with

[1] See, however, A. Sulzbach's article in the *Zeitschr. f. N.T. Wiss.* (1903), p. 190. He thinks there is an allusion to a room in the Temple where the great key was kept; this room was called Kephas, because the key was placed in a recess closed by a stone. There is also a valuable article by W. Köhler in the *Archiv für Religionswiss.* treating the question of the keys from the point of view of comparative religion.

the work of Peter. He appears as the recognized leader of the Apostles in their choice of a new member of the Twelve to take the place of Judas Iscariot (Acts i. 15 sqq.); on the day of Pentecost he seems to have played a prominent part in explaining the meaning of the scene to the people (Acts ii. 14 sqq.); and soon afterwards was arrested by the Jews on the charge of being a ringleader in the disorders caused by the healing of the lame man at the "Beautiful" gate of the temple, but was released. After this he appears as the leader of the apostles in the story of Ananias and Sapphira, who perished at his rebuke for their duplicity (Acts v. 1–11). The last episode of this period is another arrest by the priests, which ended in his being scourged and released (Acts v. 17 sqq.).

After this Peter's attention was directed to the growth of Christianity in Samaria, and he and John made a journey of inspection through that district, laying hands on those who had been baptized in order that they might receive the Holy Spirit. Here Simon Magus (*q.v.*) was encountered. He was a magician who had been converted by Philip and baptized; he desired to obtain the power of conferring the Spirit, and offered Peter money for this purpose, but was indignantly repulsed. After this Peter and John returned to Jerusalem.

During the following stay in Jerusalem, the duration of which is not defined, Peter was visited by Paul (Acts ix. 26–29; Gal. i. 18), and a comparison of the chronological date afforded by Gal. i. and ii. points to a year not earlier than 33 (Harnack) or later than 38 (C. H. Turner) for this meeting. According to Galatians, Paul saw none of the apostles on this occasion except Peter and James: it is therefore probable that none of the others were then in Jerusalem.

After this Peter made another journey, visiting especially Lydda, Joppa and Caesarea. His stay at Lydda was marked by the healing of Aeneas (Acts ix. 32–4) and at Joppa by the resuscitation of Tabitha or Dorcas. While at Joppa he stayed with Simon the tanner, and thence was summoned to Caesarea to Cornelius the centurion. He hesitated whether to go, but was persuaded by a vision and the injunction to call nothing unclean which God had cleansed. Cornelius was accordingly baptized. This is an important incident, as being the first admission of a Gentile into the church; but he was already "God-fearing," φοβούμενος τὸν θεόν (Acts x. 1), which probably denotes some sort of connexion with the Jewish synagogue, though it is difficult to say exactly what it was. After this incident Peter returned to Jerusalem. The members of the Church were somewhat shocked at the reception of a Gentile: their view apparently was that the only road to Christianity was through Judaism. They were, however, persuaded by Peter's speech (Acts xi. 4–17); but it is uncertain how far their concession went, and in the light of subsequent events it is probable that they still regarded circumcision as a necessary rite for all Christians.

After the return of Peter to Jerusalem the most important events were the famine at Jerusalem, and the persecution of the Church by Herod. During the latter Peter was put in prison (Acts xii. 3 sqq.), but was released by an angel; he first went to the house of Mary, the mother of John Mark, and afterwards went to "another place." This expression has been interpreted to mean another town, and even to be an implied reference to Rome. This last suggestion, improbable though it be, is historically important. The persecution of Herod seems to have been in his last year, which was probably A.D. 43–44. There was a marked tendency to make the duration of Peter's episcopate at Rome twenty-five years: and a combination of this tendency with the explanation that the ἕτερος τόπος was Rome probably is the origin of the traditional dating of the martyrdom of Peter in A.D. 67–68. There is, however, no justification for this view, and ἕτερος τόπος need not mean more than another house in Jerusalem.

The famine referred to in Acts xi. 27 sqq. probably began before the death of Herod, but it continued after his death, and the relief sent by the church at Antioch to Jerusalem through Paul and Barnabas probably arrived about the year 45. It is not stated in the Acts that Peter was present, and it is therefore usually assumed that he was absent, but Sir W. M. Ramsay has argued in his *St Paul the Traveller* that the visit of Paul to Jerusalem with the famine relief is the meeting between Paul and Peter referred to in Gal. ii. as the occasion of an agreement between them as to the preaching of the gospel to Jews and Gentiles. This view is not generally accepted, but it has the great advantage of avoiding the difficulty that otherwise Paul in Gal. ii. 1 sqq. must describe as his second visit to Jerusalem what was really his third. According to Ramsay, then, Peter was present during the famine, and made a private agreement with Paul that the latter should preach to the Gentiles, and so far Gentile Christianity was recognized, but the conditions of the intercourse between Gentile and Jewish Christians were not defined, and the question of circumcision was perhaps not finally settled. According to the more popular view the description in Gal. ii. applies to Acts xv. the so-called council of Jerusalem. This council met after the first missionary journey (*c.* A.D. 49) of Paul to discuss the question of the Gentiles. Peter, who was present, adopted the view that Gentile Christians were free from the obligation of the law, and this view was put into the form of the so-called Apostolic decrees by James (Acts xv. 23 sqq.).

The next information which we have about Peter is given in Gal. ii. 11 sqq. According to this he went to Antioch and at first accepted the Gentile Christians, but afterwards drew back and was rebuked by Paul. On the ordinary interpretation this must have taken place after the council, and it is exceedingly difficult to reconcile it with the attitude of Peter described in Acts xv., so that Mr C. H. Turner thinks that in this respect the account in Gal. ii. is not chronological, and places the visit of Peter to Antioch before the council. If, however, we take the theory of Sir W. M. Ramsay the matter is simpler. We thus get the compact between Paul and Peter during the famine, then a visit of Peter to Antioch, during which Peter first adopted and afterwards drew back from the position which he had agreed to privately.

History after the Council of Jerusalem.

This vacillation may then have been one of the causes which led up to the council, which may have been held before, not, as is usually thought, after the sending of the Epistle to the Galatians. For this we have no knowledge of details for which the same certainty can be claimed. There are, however, various traditions of importance. The following points are noteworthy. 1 Cor. i. 12 suggests the possibility that Peter went to Corinth, as there was a party there which used his name. It is, however, possible that this party had merely adopted the principles which, as they had been told, perhaps falsely, were supported by the leader of the Twelve. Dionysius of Corinth (*c.* 170) states that Peter was in Corinth. This may represent local tradition or may be an inference from 1 Cor. i. 12. 1 Peter suggests a ministry in the provinces of Asia Minor. There is, of course, nothing improbable in this, and even if 1 Peter be not authentic, it is early evidence for such a tradition, but it is also possible that Peter wrote to converts whom he had not personally made. This tradition is found in Origen (Eus. *H.E.* iii. 1), Epiphanius (*Haer.* xxvii., vi.), Jerome (*De Vir. ill.* 1) and other later writers; but it is possible that it is merely an inference from the epistle. Early tradition connects Peter with Antioch, of which he is said to have been the first bishop. The first writer to mention it is Origen (*Hom. vi. in Lucam*), but it is also found in the Clementine *Homilies* and *Recognitions* (*Hom.* 20, 23; *Recog.* 10, 68) and probably goes back to the lists of bishops which were drawn up in the 2nd century. Other important references to this tradition are found in Eus. *H.E.* iii. 26, 2; *Apost. Const.* vii. 46; Jerome, *De Vir. ill.* 1; *Chronicon paschale*; and *Liber pontificalis*. The tradition of work in Antioch may well be historical. Otherwise it is a rather wild elaboration of Gal. ii. 11. The most important and widespread tradition is that Peter came to Rome; and though this tradition has often been bitterly attacked, it seems to be probable that it is at least in outline quite historical. The evidence for it is earlier and better than that for any other tradition, though it is not quite convincing.

The earliest witness to a residence of Peter in Rome is probably

1 Peter, for (see PETER, EPISTLES OF) it is probable that the reference to Babylon ought to be interpreted as meaning Rome. If so, and if the epistle be genuine, this is conclusive evidence that Peter was in Rome. Even if the epistle be not genuine it is evidence of the same tradition. Nor is corroboration lacking: Clement (*c.* A.D. 97) refers to Peter and Paul as martyrs (1 *Clem.* 5–6) and says that "To these men . . . there was gathered a great company of the elect who . . . became an example to us." This points in two ways to a martyrdom of Peter in Rome, (1) because Peter and Paul are co-ordinated, and it is generally admitted that the latter suffered in Rome, (2) because they seem to be joined to the great company of martyrs who are to be an example to the Church in Rome. Similarly Ignatius (*c.* A.D. 115) says to the Romans (Rom. iv.), "I do not command you as Peter and Paul." The suggestion obviously is that the Romans had been instructed by these Apostles. By the end of the 2nd century the tradition is generally known: Irenaeus (3, 1, 1), Clement of Alexandria (comment. on 1 Peter), Origen (*Hom. vi. in Lucam*), Tertullian (*Scorp.* 15, and several passages) are explicit on the point, and from this time onwards the tradition is met with everywhere. There is also a tradition, found in Irenaeus (3, 1, 1) and in many later writers, and supported by 1 Pet. v. 13, and by the statements of Papias (Eus. *H. E.* 3, 39, 15) that Mark acted as Peter's assistant in Rome and that his gospel is based on recollections of Peter's teaching.

This evidence is probably sufficient to establish the fact that Peter, like Paul, had a wide missionary career ending in a violent death at Rome, though the details are not recoverable. The chronological question is more difficult both as regards the beginning and the end of this period of activity.

The Chronology of Peter's Wider Missionary Work.

The Acts, in describing the visits of Peter to Samaria, Joppa, Lydda and Caesarea, justify the view that his missionary activity began quite early. Gal. ii. 11 and 1 Cor. ix. 5 show that Acts minimizes rather than exaggerates this activity; the Antiochian tradition probably represents a period of missionary activity with a centre at Antioch; similarly the tradition of work in Asia is possibly correct as almost certainly is that of the visit to Rome. But we have absolutely no evidence justifying a chronological arrangement of these periods. Even the silence of Paul in the epistles of the captivity proves nothing except that Peter was not then present; the same is true of 2 Tim. even if its authenticity be undoubted.

The evidence as to the date of his death is a little fuller, but not quite satisfactory. The earliest direct witness is Tertullian, who definitely states that Peter suffered under Nero by crucifixion. Origen also relates the latter detail, and adds that at his own request Peter was crucified head downwards. Probably John xxi. 18 seq. is a still earlier reference to his crucifixion. Fuller evidence is not found until Eusebius, who dates the arrival of Peter at Rome in 43 and his martyrdom twenty-five years later. But the whole question of the Eusebian chronology is very confused and difficult, and the text of the *Chronicon* is not certain. The main objection to this date is based partly on general probability, partly on the language of Clement of Rome. It is more probable on general grounds that the martyrdom of Peter took place during the persecution of Christians in 64, and it is urged that Clement's language refers to this period. It is quite possible that an error of a few years has crept into the Eusebian chronology, which is probably largely based on early episcopal lists, and therefore many scholars are inclined to think that 64 is a more probable date than 67. As a rule the discussion has mainly been between these two dates, but Sir W. M. Ramsay, in his *Church in the Roman Empire*, has adopted a different line of argument. He thinks that 1 Peter was written *c.* A.D. 80, but that it may nevertheless be Petrine; therefore he lays stress on the fact that whereas the tradition that Peter was in Rome is early and probably correct, the tradition that he was martyred under Nero is not found until much later. Thus he thinks it possible that Peter survived until *c.* 80, and was martyred under the Flavian emperors. The weak point of this theory is that Clement and Ignatius bring Peter and Paul together in a way which seems to suggest that they perished, if not together, at least at about the same time. If this view be rejected and it is necessary to fall back on the choice between 64 and 67, the problem is perhaps insoluble, but 64 has somewhat more intrinsic probability, and 67 can be explained as due to an artificial system of chronology which postulated for Peter an episcopate of Rome of twenty-five years—a number which comes so often in the early episcopal lists that it seems to mean little more than "a long time," just as "forty years" does in the Old Testament. On the whole 64 is the most probable date, but it is very far from certain: the evidence is insufficient to justify any assurance.

For further information and discussion see especially Harnack's *Chronologie*, and Bishop Chase's article in Hastings's *Dictionary of the Bible*. The latter is in many ways the most complete statement of the facts at present published.

The Grave of Peter.

Caius, who lived in the beginning of the 3rd century (see Eus. *H. E.* 2, 25), stated that the τρόπαια (*i.e.* probably the burial-place, not that of execution) of Peter and Paul were on the Vatican. This is also found in the *Acta Petri*, 84 (in the *Lib. Pont.*, ed. Duchesne, p. 52 seq., 118 sqq.). From this place it appears that the relics (whether genuine or not) were moved to the catacombs in A.D. 258 (cf. the *Depositis martyrum*, and see Lightfoot's *Clement*, i. 249); hence arose the tradition of an original burial in the catacombs, found in the Hieronymian Martyrology.

For further information and investigations see Duchesne, *Liber pontificalis*; Lipsius, *Die Apokr. Apostelgesch.*; and Erbes, "Die Todestage der Apostel Paulus u. Petrus," in *Texte und Untersuchungen*, N.F., iv. 1. (K. L.)

PETER I., called "the Great" (1672–1725), emperor of Russia, son of the tsar Alexius Mikhailovich and Natalia Naruishkina, was born at Moscow on the 30th of May 1672. His earliest teacher (omitting the legendary Scotchman Menzies) was the *dyak*, or clerk of the council, Nikita Zotov, subsequently the court fool, who taught his pupil to spell out the liturgical and devotional books on which the children of the tsar were generally brought up. After Zotov's departure on a diplomatic mission, in 1680, the lad had no regular tutor. From his third to his tenth year Peter shared the miseries and perils of his family. His very election (1682) was the signal for a rebellion. He saw one of his uncles dragged from the palace and butchered by a savage mob. He saw his mother's beloved mentor, and his own best friend, Artamon Matvyeev, torn, bruised and bleeding, from his retaining grasp and hacked to pieces. The haunting memories of these horrors played havoc with the nerves of a supersensitive child. The convulsions from which he suffered so much in later years must be partly attributed to this violent shock. During the regency of his half-sister Sophia (1682–1689) he occupied the subordinate position of junior tsar, and after the revolution of 1689 Peter was still left pretty much to himself. So long as he could indulge freely in his favourite pastimes—ship-building, ship-sailing, drilling and sham fights—he was quite content that others should rule in his name. He now found a new friend in the Swiss adventurer, François Lefort, a shrewd and jovial rascal, who not only initiated him into all the mysteries of profligacy (at the large house built at Peter's expense in the German settlement), but taught him his true business as a ruler. His mother's attempt to wean her prodigal son from his dangerous and mostly disreputable pastimes, by forcing him to marry the beautiful but stupid Eudoxia Lopukhina (Jan. 27, 1689), was a disastrous failure. The young couple were totally unsuited to each other. Peter practically deserted his unfortunate consort a little more than a year after their union.

The death of his mother (Jan. 25, 1694) left the young tsar absolutely free to follow his natural inclinations. Tiring of the great lake at Pereyaslavl, he had already seen the sea for the first time at Archangel in July 1693, and on the 1st of May 1694 returned thither to launch a ship built by himself the year before. Shortly afterwards he nearly perished during a storm in an adventurous voyage to the Solovetsky Islands in

the White Sea. His natural bent was now patent. From the first the lad had taken an extraordinary interest in the technical and mechanical arts, and their application to military and naval science. He was taught the use of the astrolabe (which Prince Yakov Dolgoruki, with intent to please, had brought him from Paris) by a Dutchman, Franz Timmerman, who also instructed him in the rudiments of geometry and fortifications. He had begun to build his own boats at a very early age, and the ultimate result of these pastimes was the creation of the Russian navy. He had already surrounded himself with that characteristically Petrine institution "the jolly company," or "the company," as it was generally called, consisting of all his numerous personal friends and casual acquaintances. "The company" was graduated into a sort of mock hierarchy, political and ecclesiastical, and shared not only the orgies but also the labours of the tsar. Merit was the sole qualification for promotion, and Peter himself set the example to the other learners by gradually rising from the ranks. In 1695 he had only advanced to the post of "skipper" in his own navy and of "bombardier" in his own army. It was, however, the disreputable Lefort who, for the sake of his own interests, diverted the young tsar from mere pleasure to serious enterprises, by persuading him first to undertake the Azov expedition, and then to go abroad to complete his education.

By this time the White Sea had become too narrow for Peter, and he was looking about him for more hospitable waters. The Baltic was a closed door to Muscovy, and the key to it was held by Sweden. The Caspian remained; and it had for long been a common saying with foreign merchants that the best way of tapping the riches of the Orient was to secure possession of this vast inland lake. But so long as the Turks and Tatars made the surrounding steppes uninhabitable the Caspian was a possession of but doubtful value. The first step making for security was to build a fleet strong enough to provide against the anarchical condition of those parts; but this implied a direct attack not only upon the Crimean khan, who was mainly responsible for the conduct of the Volgan hordes, but upon the khan's suzerain, the Turkish sultan. Nevertheless Peter did not hesitate. War against Turkey was resolved upon, and Azov, the chief Turkish fortress in those regions, which could be approached by water from Moscow, became the Russian objective. From the 8th of July to the 22nd of September 1695 the Muscovites attempted in vain to capture Azov. On the 22nd of November Peter re-entered Moscow. His first military expedition had ended in unmitigated disaster, yet from this disaster is to be dated the reign of Peter the Great.

Immediately after his return he sent to Austria and Prussia for as many sappers, miners, engineers and carpenters as money could procure. He meant to build a fleet strong enough to prevent the Turkish fleet from relieving Azov. The guards and all the workmen procurable were driven, forthwith, in bands, to all the places among the forests of the Don to fell timber and work day and night, turning out scores of vessels of all kinds. Peter himself lived among his workmen, himself the most strenuous of them all, in a small two-roomed wooden hut at Voronezh. By the middle of April two warships, twenty-three galleys, four fireships and numerous smaller craft were safely launched. On the 3rd of May "the sea caravan" sailed from Voronezh, "Captain Peter Aleksyeevich" commanding the galley-flotilla from the galley "Principium," built by his own hand. The new Russian fleet did all that was required of it by preventing the Turks from relieving Azov by water; and on the 18th of July the fortress surrendered. Peter now felt able to advance along the path of progress with a quicker and a firmer step. It was resolved to consolidate the victory by establishing a new naval station at the head of the Sea of Azov, to which the name of Taganrog was given. But it was necessary to guarantee the future as well as provide for the present. Turkey was too formidable to be fought single-handed, and it was therefore determined to send a grand embassy to the principal western powers to solicit their co-operation against the Porte. On the 10th of March 1697 this embassy, under the leadership of Lefort, set out on its travels. Peter attached himself to it as a volunteer sailorman, "Peter Mikhailov," so as to have greater facility for learning ship-building and other technical sciences. As a political mission it failed utterly, the great powers being at that period far more interested in western than in eastern affairs. But personally Peter learnt nearly all that he wanted to know—gunnery at Königsberg, ship-building at Saardam and Deptford, anatomy at Leiden, engraving at Amsterdam—and was proceeding to Venice to complete his knowledge of navigation when the revolt of the *stryeltsy*, or musketeers (June 1698), recalled him to Moscow. This revolt has been greatly exaggerated. It was suppressed in an hour's time by the tsar's troops, of whom only one man was mortally wounded; and the horrible vengeance (September–October 1698) which Peter on his return to Russia wreaked upon the captive musketeers was due not to any actual fear of these antiquated warriors, but to his consciousness that behind them stood the reactionary majority of the nation who secretly sympathized with, though they durst not assist, the rebels.

Peter's foreign tour had more than ever convinced him of the inherent superiority of the foreigner. Imitation had necessarily to begin with externals, and Peter at once fell foul of the long beards and Oriental costumes which symbolized the arch-conservatism of old Russia. On the 26th of April 1698 the chief men of the tsardom were assembled round his wooden hut at Preobrazhenskoye, and Peter with his own hand deliberately clipped off the beards and moustaches of his chief boyars. The *ukaz* of the 1st of September 1698 allowed as a compromise that beards should be worn, but a graduated tax was imposed upon their wearers. The wearing of the ancient costumes was forbidden by the *ukaz* of the 4th of January 1700; thenceforth Saxon or Magyar jackets and French or German hose were prescribed. That the people themselves did not regard the reform as a trifle is plain from the numerous rebellions against it. By the *ukaz* of the 20th of December 1699 it was next commanded that henceforth the new year should not be reckoned, as heretofore, from the 1st of September, supposed to be the date of the creation, but from the first day of January, *anno domini*.

The year 1700 is memorable in Russian history as the starting-point of Peter's long and desperate struggle for the hegemony of the north. He had concluded peace with the Porte (June 13, 1700) on very advantageous terms, in order to devote himself wholly to a war with Sweden to the end that Russia might gain her proper place on the Baltic. The possession of an ice-free seaboard was essential to her natural development; the creation of a fleet would follow inevitably upon the acquisition of such a seaboard; and she could not hope to obtain her due share of the trade and commerce of the world till she possessed both. All the conjunctures seemed favourable to Peter. The Swedish government was in the hands of an untried lad of sixteen; and the fine fleets of Denmark, and the veteran soldiers of Saxony, were on the same side as the myriads of Muscovy. It seemed an easy task for such a coalition to wrest the coveted spoil from the young Charles XII.; yet Peter was the only one of the three conspirators who survived the Twenty-one Years' War in which they so confidently embarked during the summer of 1701. He was also the only one of them who got anything by it. Charles's "immersion in the Polish bog" (1702–1707), as Peter phrased it, enabled the tsar, not without considerable expense and trouble, to conquer Ingria and lay the foundations of St Petersburg. In these early days Peter would very willingly have made peace with his formidable rival if he had been allowed to retain these comparatively modest conquests. From 1707 to 1709 the war on his part was purely defensive; Charles would not hear of peace till full restitution had been made and a war indemnity paid, while Peter was fully resolved to perish rather than surrender his "paradise," Petersburg. After Pultava (June 26, 1709), Peter, hitherto commendably cautious even to cowardice, but now puffed up with pride, rashly plunged into as foolhardy an enterprise as ever his rival engaged in. The campaign of the Pruth (March to July 1711) must have been fatal to the

tsar but for the incalculable behaviour of the omnipotent grand vizier, who let the Russian army go at the very instant when it lay helpless in the hollow of his hand. Even so, Peter, by the peace of the Pruth, had to sacrifice all that he had gained by the Azov expedition fifteen years previously. On receiving the tidings of the conclusion of the peace of Nystad (August 30, 1721), Peter declared, with perfect justice, that it was the most profitable peace Russia had ever concluded. The gain to Russia was, indeed, much more than territorial. In surrendering the pick of her Baltic provinces, Sweden had surrendered along with them the hegemony of the north, and all her pretensions to be considered a great power.

The Great Northern War was primarily a training school for a backward young nation, and in the second place a means of multiplying the material resources of a nation as poor as she was backward. During the whole course of it the process of internal domestic reformation had been slowly but unceasingly proceeding. Brand-new institutions on Western models were gradually growing up among the cumbrous, antiquated, worn-out machinery of old Muscovy; and new men, like Menshikov, Goloykin, Apraksin, Osterman, Kurakin, Tolstoy, Shafirov, Prokopovich, Yaguszhinsky, Yavorsky, all capable, audacious, and brimful of new ideas, were being trained under the eye of the great regenerator to help him to carry on his herculean task. At first the external form of the administration remained much the same as before. The old dignities disappeared of their own accord with the deaths of their holders, for the new men, those nearest to Peter, did not require them. "The Administrative Senate" was not introduced till 1711, and only then because the interminable war, which required Peter's prolonged absence from Russia, made it impossible for him to attend to the details of the domestic administration. Still later came the "Spiritual Department," or "Holy Synod" (January 1721), which superseded the ancient patriarchate. It was established, we are told, "because simple folks cannot distinguish the spiritual power from the sovereign power, and suppose that a supreme spiritual pastor is a second sovereign, the spiritual authority being regarded as higher and better than the temporal." From the first the regenerator in his *ukazes* was careful to make everything quite plain. He was always explaining why he did this or that, why the new was better than the old, and so on; and we must recollect that these were the first lessons of the kind the nation had ever received. The whole system of Peter was deliberately directed against the chief evils from which old Muscovy had always suffered, such as dissipation of energy, dislike of co-operation, absence of responsibility, lack of initiative, the tyranny of the family, the insignificance of the individual. The low social morality of all classes, even when morality was present at all, necessitated the regeneration of the nation against its will, and the process could therefore only be a violent one. Yet the most enlightened of Peter's contemporaries approved of and applauded his violence; some of them firmly believed that his most energetic measures were not violent enough. Thus Ivan Poroshkov, Peter's contemporary, the father of Russian political economy, writes as follows: "If any land be over-much encumbered with weeds, corn cannot be sown thereon unless the weeds first be burned with fire. In the same way, our ancient inveterate evils should also be burnt with fire." Peter himself carried this principle to its ultimate limits in dealing with his unfortunate son the Tsarevich Alexius (*q.v.*). From an ethical and religious point of view the deliberate removal of Alexius was an abominable, an inhuman crime: Peter justified it as necessary for the welfare of the new Russia which he had called into existence.

The official birthday of the Russian Empire was the 22nd of October 1721, when, after a solemn thanksgiving service in the Troitsa Cathedral for the peace of Nystad, the tsar proceeded to the senate and was there acclaimed: "Father of the Fatherland, Peter the Great, and Emperor of All Russia." Some Russians would have preferred to proclaim Peter as Emperor of the East; but Peter himself adopted the more patriotic title.

Towards the end of the reign the question of the succession to the throne caused the emperor some anxiety. The rightful heir, in the natural order of primogeniture, was the little grand duke Peter, son of the tsarevich Alexius, a child of six; but Peter decided to pass him over in favour of his own beloved consort Catherine. The *ustav*, or ordinance of 1722, heralded this unheard-of innovation. Time-honoured custom had hitherto reckoned primogeniture in the male line as the best title to the Russian crown; in the *ustav* of 1722 Peter denounced primogeniture in general as a stupid, dangerous, and even unscriptural practice of dubious origin. The *ustav* was but a preliminary step to a still more sensational novelty. Peter had resolved to crown his consort empress, and on the 15th of November 1723 he issued a second manifesto explaining at some length why he was taking such an unusual step. That he should have considered any explanation necessary demonstrates that he felt himself to be treading on dangerous ground. The whole nation listened aghast to the manifesto. The coronation of a woman was in the eyes of the Russian people a scandalous innovation in any case, and the proposed coronation was doubly scandalous in view of the base and disreputable origin of Catherine herself (see CATHERINE I.). But Peter had his way, and the ceremony took place at Moscow with extraordinary pomp and splendour on the 7th of May 1724.

During the last four years of his reign Peter's policy was predominantly Oriental. He had got all he wanted in Europe, but the anarchical state of Persia at the beginning of 1722 opened up fresh vistas of conquest. The war which lasted from May 1722 to September 1723 was altogether successful, resulting in the acquisition of the towns of Baku and Derbent and the Caspian provinces of Gilan, Mazandaran and Astarabad. The Persian campaigns wore out the feeble health of Peter, who had been ailing for some time. A long and fatiguing tour of inspection over the latest of his great public works, the Ladoga Canal, during the autumn of 1724, brought back another attack of his paroxysms, and he reached Petersburg too ill to rally again, though he showed himself in public as late as the 16th of January 1725. He expired in the arms of his consort, after terrible suffering, on the 28th of that month.

Peter's claim to greatness rests mainly on the fact that from first to last he clearly recognized the requirements of the Russian nation and his own obligations as its ruler. It would have materially lightened his task had he placed intelligent foreigners at the head of every department of state, allowing them gradually to train up a native bureaucracy. But for the sake of the independence of the Russian nation he resisted the temptation of taking this inviting but perilous short-cut to greatness. He was determined that, at whatever cost, hardship and inconvenience, Russia should be ruled by Russians, not by foreigners; and before his death he had the satisfaction of seeing every important place in his empire in the hands of capable natives of his own training. But even in his most sweeping reforms he never lost sight of the idiosyncrasies of the people. He never destroyed anything which he was not able to replace by something better. He possessed, too, something of the heroic nature of the old Russian *bogatuirs*, or demigods, as we see them in the *skaski* and the *builinui*. His expansive nature loved width and space. No doubt this last of the *bogatuirs* possessed the violent passions as well as the wide views of his prototypes. All his qualities, indeed, were on a colossal scale. His rage was cyclonic: his hatred rarely stopped short of extermination. His banquets were orgies, his pastimes convulsions. He lived and he loved like one of the giants of old. There are deeds of his which make humanity shudder, and no man equally great has ever descended to such depths of cruelty and treachery. Yet it may generally be allowed that a strain of nobility, of which we occasionally catch illuminating glimpses, extorts from time to time an all-forgiving admiration. Strange, too, as it may sound, Peter the Great was at heart profoundly religious. Few men have ever had a more intimate persuasion that they were but instruments for good in the hands of God.

PETER II. (1715–1730), emperor of Russia, only son of the tsarevich Alexius, was born on the 18th of October 1715. From his childhood the orphan grand duke was kept in the strictest seclusion. His grandfather, Peter the Great, systematically ignored him. His earliest governesses were the wives of a tailor and a vintner from the Dutch settlement; a sailor called Norman taught him the rudiments of navigation; and, when he grew older, he was placed under the care of a Hungarian refugee, Janos Zeikin, who seems to have been a conscientious teacher. During the reign of Catherine I. Peter was quite ignored; but just before her death it became clear to those in power that the grandson of Peter the Great could not be kept out of his inheritance much longer. The majority of the nation and three-quarters of the nobility were on his side, while his uncle, the emperor Charles VI., through the imperial ambassador at St Petersburg, Rabutin, persistently urged his claims. The matter was arranged between Menshikov, Osterman and Rabutin; and on the 18th of May 1727 Peter II., according to the terms of the supposed last will of Catherine I., was proclaimed sovereign autocrat. The senate, the privy council and the guards took the oath of allegiance forthwith. The education of the young prince was wisely entrusted to the vice-chancellor Osterman. Menshikov, who took possession of Peter II. and lodged him in his own palace on the Vasily island, had intended to marry Peter to his daughter Maria; the scheme was frustrated by his fall (Sept. 21, 1727); but Peter only fell into the hands of the equally unscrupulous Dolgoruki, who carried him away from Petersburg to Moscow. Peter's coronation was celebrated at that city on the 25th of February 1728. He was betrothed to Catherine, second daughter of Alexis Dolgoruki, and the wedding was actually fixed for the 30th of January 1730; but on that very day the emperor died of small-pox.

PETER III. (1728–1762), emperor of Russia, only son of Charles Frederick, duke of Holstein-Gottarp, and of Anne, eldest surviving daughter of Peter the Great, was born at Kiel on the 21st of February 1728. In December 1741 he was adopted by his aunt, Elizabeth Petrovna, as soon as she was safely established on the Russian throne, and on the 18th of November 1742 was received into the Orthodox Church, exchanging his original name of Karl Peter Ulrich for that of Peter Fedorovich. On the 21st of August 1745, by the command of his aunt, he married the princess Sophia Augusta Frederica of Anhalt-Zerbst, who exchanged her name for that of Catherine Aleksyeevna. The union between a prince who physically was something less than a man and mentally little more than a child, and a princess of prodigious intellect and an insatiable love of enjoyment, was bound to end in a catastrophe. But there is no foundation for the stories of Peter's neglect and brutality. It took the spouses five years to discover that their tastes were divergent and their tempers incompatible. Even when Peter III. succeeded his aunt on the 5th of January 1762, he paid off all the debts that Catherine had contracted without inquiring what they were for. On her birthday, in April, he made her a present of domains worth £10,000 per annum, though he had already readjusted her establishment on a truly imperial scale. A great deal has been made of Peter's infidelity towards his consort; but the only one who really suffered from his liaison with the ugly, stupid and vixenish countess Elizabeth Vorontsóva was the unfortunate emperor. So far from being scandalized by the juxtaposition of "Das Fräulein" in the Winter Palace, Catherine accepted it as a matter of course, provided that her own relations with the handsome young guardsman, Gregory Orlov, were undisturbed. Nor was Peter's behaviour to his consort in public of the outrageous character we have been led to suppose. Peter, in fact, was too good-natured and inconsequent to pursue, or even premeditate, any deliberate course of ill-treatment. No personal wrongs, but the deliberate determination of a strong-minded, capable woman to snatch the reins of government from the hands of a semi-imbecile, was the cause of Peter's overthrow, and his stupendous blunders supplied Catherine with her opportunity. Peter's foreign policy was the absolute reversal of the policy of his predecessor. He had not been on the throne for two months when he made pacific overtures to the wellnigh vanquished king of Prussia, whom he habitually alluded to as "the king my master." Peter's enthusiastic worship of Frederick resulted in a peace (May 5) and then (June 19) in an offensive and defensive alliance between Russia and Prussia, whereby Peter restored to Prussia all the territory won from her by Russia during the last five years at such an enormous expense of men and money, and engaged to defend Frederick against all his enemies. This was followed up by a whole series of menacing rescripts addressed by Peter to the court of Vienna, in which war was threatened unless Austria instantly complied with all the demands of the king of Prussia. Finally he picked a quarrel with Denmark for not accepting as an ultimatum the terms to be submitted by Russia to a peace conference to meet at Berlin for the purpose of adjusting the differences between the two powers. On the 6th of July the Russian army received orders to invade Denmark by way of Mecklenburg. This advance was only arrested, when the opposing forces were almost within touch of each other, by the tidings that a revolution had taken place at St Petersburg, and that Peter III. was already a prisoner in the hands of his consort. The *coup d'état* of the 9th of July 1762 properly belongs to the history of Catherine II. (*q.v.*). Here only a few words must be said as to the mysterious death of Peter at the castle of Ropsha, to which he was removed immediately after his surrender. Here he remained from the evening of the 9th to the afternoon of the 18th of July. At first Catherine and her counsellors could not make up their minds what to do with "the former emperor." Imprisonment in Schlüsselburg for life, or repatriation to Holstein, were proposed only to be rejected as dangerous. The Orlovs had even stronger motives than Catherine for suppressing the ex-emperor, for Gregory Orlov aspired to win the hand as well as the heart of his imperial mistress, and so long as Catherine's lawful husband lived, even in a prison, such a union would be impossible. The available evidence points to the irresistible conclusion that on the afternoon of the 18th of July 1762, Peter III., with his consort's connivance, was brutally murdered at Ropsha by Alexius Orlov, Theodore Baryatinski, and several other persons still unknown.

PETER (Pedro), the name of several Spanish kings.

Peter I., king of Aragon (d. 1104), son of Sancho Ramirez, the third in order of the historic kings of Aragon, belonged to times anterior to the authentic written history of his kingdom; and little is known of him save that he recovered Huesca from the Mahommedans in 1096.

Peter II., king of Aragon (1174–1213), son of Alphonso II. and his wife Sancia, daughter of Alphonso VIII. of Castile, was born in 1174. He had a very marked and curious personal character. As sovereign of lands on both sides of the Pyrenees, he was affected by very different influences. In his character of Spanish prince he was a crusader, and he took a distinguished part in the great victory over the Almohades at the Navas de Tolosa in 1212. But his lands to the north of the Pyrenees brought him into close relations with the Albigenses. He was a favourer of the troubadours, and in his ways of life he indulged in the laxity of Provençal morals to the fullest extent. We are told in the chronicle written by Desclot soon after his time,

that Peter was only trapped into cohabiting with his wife by the device which is familiar to readers of *Measure for Measure*. In the year after the battle of the Navas de Tolosa he took up arms against the crusaders of Simon of Montfort, moved not by sympathy with the Albigenses, but by the natural political hostility of the southern princes to the conquering intervention of the north under pretence of religious zeal. His son records the way in which he spent the night before the battle of Muret with a crudity of language which defies translation, and tells us that his father was too exhausted in the morning to stand at Mass, and had to be lifted into the saddle by his squires. Peter none the less showed the greatest personal valour, and his body, recognizable by his lofty stature and personal beauty, was found on the field after the rout (Sept. 12, 1213).

See *Chronicle of James I. of Aragon*, translated by J. Forster (London, 1883); and *Life and Times of James the First the Conqueror*, by F. Darwin Swift (Oxford, 1894).

PETER III., king of Aragon (1236–1286), son of James the Conqueror, and his wife Yolande, daughter of Andrew II. of Hungary, was born in 1236. Having married Constance, daughter of Manfred of Beneventum, he came forward as the representative of the claims of the Hohenstaufen in Naples and Sicily against Charles, duke of Anjou. Peter began the long strife of the Angevine and Aragonese parties in southern Italy. His success in conquering Sicily earned him the surname of "the Great." He repelled an invasion of Catalonia undertaken by the king of France in support of Charles of Anjou, and died on the 8th of November 1286.

For the personal character of Peter III., the best witness is the *Chronicle* of Ramonde Muntanez—reprinted in the original Catalan by R. Lanz, *Literarischer Verein in Stuttgart*, vol. vii. (1844), and in French by Buchon, *Coll. des chroniques nationales* (Paris, 1824–1828). See also O. Cartellieri, *Peter von Aragon und die Sizilianische Vesper* (Heidelberg, 1904).

PETER IV., king of Aragon (d. 1387), son of Alphonso IV. and his wife Terasa d'Enteça, is known as "The Ceremonious" and also as "he of the dagger." He acquired the first title by the rigid etiquette he enforced, as one means of checking the excessive freedom of his nobles. The second name was given him because he wounded himself with his dagger in the act of cutting to pieces the so-called "charter of the Union," which authorised the rebellions of his nobles, and which he forced them to give up, after he had routed them at the battle of Epila in 1348. Of no man of the 14th century can it be more truly said that his life was a warfare on earth. He had first to subdue his nobles, and to reannex the Balearic Islands to the crown of Aragon. When he had made himself master at home, he had to carry on a long and fierce contest with his namesake Peter the Cruel of Castile, which only terminated when Henry of Trastamara succeeded, largely with Aragonese help, in making himself king of Castile in 1369. Peter succeeded in making himself master of Sicily in 1377, but ceded the actual possession of the island to his son Martin. He was three times married: to Mary, daughter of Philip of Evreux, king of Navarre; to Eleanor, daughter of Alphonso IV. of Portugal; and to Eleanor, daughter of Peter II. of Sicily, his cousin. The marriage of his daughter by his third marriage, Eleanor, with John I. of Castile, carried the crown of Aragon to the Castilian line when his male representatives became extinct on the death of his son Martin in 1410.

See Zurita, *Anales de Aragon* (Saragossa, 1610).

PETER, "the Cruel," king of Castile (1333–1369), son of Alphonso XI. and Maria, daughter of Alphonso IV. of Portugal, was born in 1333. He earned for himself the reputation of monstrous cruelty which is indicated by his accepted title. In later ages, when the royal authority was thoroughly established, there was a reaction in Peter's favour, and an alternative name was found for him. It became a fashion to speak of him as *El Justiciero*, the executer of justice. Apologists were found to say that he had only killed men who themselves would not submit to the law or respect the rights of others. There is this amount of foundation for the plea, that the chronicler Lopez de Ayala, who fought against him, has confessed that the king's fall was regretted by the merchants and traders, who enjoyed security under his rule. Peter began to reign at the age of sixteen, and found himself subjected to the control of his mother and her favourites. He was immoral, and unfaithful to his wife, as his father had been. But Alphonso XI. did not imprison his wife, or cause her to be murdered. Peter certainly did the first, and there can be little doubt that he did the second. He had not even the excuse that he was passionately in love with his mistress, Maria de Padilla; for, at a time when he asserted that he was married to her, and when he was undoubtedly married to Blanche of Bourbon, he went through the form of marriage with a lady of the family of Castro, who bore him a son, and then deserted her. Maria de Padilla was the only one lady of his harem of whom he never became quite tired. At first he was controlled by his mother, but emancipated himself with the encouragement of the minister Albuquerque and became attached to Maria de Padilla. Maria turned him against Albuquerque. In 1354 the king was practically coerced by his mother and the nobles into marrying Blanche of Bourbon, but deserted her at once. A period of turmoil followed in which the king was for a time overpowered and in effect imprisoned. The dissensions of the party which was striving to coerce him enabled him to escape from Toro, where he was under observation, to Segovia. From 1356 to 1366 he was master, and was engaged in continual wars with Aragon, in which he showed neither ability nor daring. It was during this period that he perpetrated the series of murders which made him odious. He confided in nobody save the Jews, who were his tax-gatherers, or the Mahommedan guard he had about him. The profound hatred of the Christians for the Jews and *Mudejares*, or Mahommedans settled among them, dates from the years in which they were the agents of his unbridled tyranny. In 1366 he was assailed by his bastard brother Henry of Trastamara at the head of a host of soldiers of fortune, and fled the kingdom without daring to give battle. Almost his last act in Spain was to murder Suero, the archbishop of Santiago, and the dean, Peralvarez. Peter now took refuge with the Black Prince, by whom he was restored in the following year. But he disgusted his ally by his faithlessness and ferocity. The health of the Black Prince broke down, and he left Spain. When thrown on his own resources, Peter was soon overthrown by his brother Henry, with the aid of Bertrand du Guesclin and a body of French free companions. He was murdered by Henry in du Guesclin's tent on the 23rd of March 1369. His daughters by Maria de Padilla, Constance and Isabella, were respectively married to John of Gaunt, and Edmund, duke of York, sons of Edward III., king of England.

The great original but hostile authority for the life of Peter the Cruel is the *Chronicle* of the Chancellor Pero Lopez de Ayala (Madrid 1779–1780). A brilliantly written Life is that by Prosper Mérimée, *Hist. de Don Pèdre I., roi de Castille* (Paris, 1848). (D. H.)

PETER DES ROCHES (d. 1238), bishop of Winchester under John and Henry III., and conspicuous among the foreign favourites to whom these sovereigns owed much of their unpopularity, was a Poitevin by extraction. He received the office of chamberlain towards the close of Richard's reign, and under Richard's successor became an influential counsellor. In 1205, doubtless through John's influence, he was elected to the see of Winchester. His election was disputed but, on appeal, confirmed by Pope Innocent III., who honoured Peter by consecrating him in person. None the less, the new bishop stood by his royal patron during the whole period of the interdict. In 1213 he was made justiciar in succession to Geoffrey Fitz Peter. This promotion was justified by the fidelity with which Peter supported the king through the barons' war. At the battle of Lincoln (1217) Peter led a division of the royal army and earned some distinction by his valour; but he played a secondary part in the government so long as William Marshal held the regency. After Marshal's death (1219) Peter led the baronial opposition to Hubert de Burgh, with varying success. At first the justiciar was successful. In 1221 Peter meditated going on crusade; 1223–1224 saw his party broken up by Hubert's energetic measures; in 1227 was himself dismissed from his office and

turned his back on England to join the crusade of the emperor Frederick II. He was absent from England until 1231; but in the meantime enhanced his reputation both as a soldier and diplomatist. After the fall of De Burgh he kept in the background, but offices and honours were heaped on his dependants, especially on his nephew, Peter des Rievaulx, and other Poitevins. This foreign party triumphed over the revolt which was headed by Richard Marshal in 1233. But the primate, Edmund Rich, voiced the general feeling when he denounced Peter as a mischief maker, and demanded that he should be dismissed from court. The king complied, and threatened the bishop with charges of malversation. Peter was however permitted to leave the country with a pardon (1235); he conciliated Gregory IX. by rendering efficient aid in a war with the citizens of Rome (1235); and in the next year returned without molestation to his see. He was invited to go as the king's envoy to the court of Frederick II., but refused apparently on the score of ill health. His public reconciliation with De Burgh (1236), effected through the mediation of the papal legate, provided a dramatic close to their long rivalry, but had no political significance, since both were now living in retirement. Peter died in 1238, and was buried at Winchester. He was undoubtedly a man of a winning personality, a good diplomat and financier, a statesman whose unpopularity was due in some measure to his freedom from the insularity of the Englishmen, against whom he matched himself. But his name is associated with a worthless clique of favourites, and with the first steps which were taken by Henry III. to establish a feeble and corrupt autocracy.

See C. Petit Dutaillis, *Vie et règne de Louis VIII.* (Paris, 1894); Lecointre Dupont, *Pierre des Roches* (Poitiers, 1868); Stubbs's *Constitutional History of England*, vol. ii.; H. W. C. Davis, *England under the Normans and Angevins* (1905); T. F. Tout in the *Political History of England* (1905), vol. iii. (H. W. C. D.)

PETER LOMBARD (*c.* 1100–*c.* 1160), bishop of Paris, better known as *Magister sententiarum*, the son of obscure parents, was born about the beginning of the 12th century, at Novara (then reckoned as belonging to Lombardy). After receiving his education at Bologna, he removed to France, bearing a recommendation to Bernard of Clairvaux, who first placed him under Lotolf at Reims, and afterwards sent him to Paris with letters to Gilduin, the abbot of St Victor. He soon became known as a teacher, and obtained a theological chair in the cathedral school. His famous textbook, the *Sententiae*, was written between 1145 and 1150. On the 29th of June 1159 he became bishop of Paris. The accounts of his bishopric are satisfactory. There is a charge that he was guilty of simony, having received his office through the favour of Philip, brother of Louis VII., his former pupil. The date of his death is uncertain. According to one account he died on the 20th of July 1160, and as Maurice de Sully became bishop that year the statement seems probable. Yet there is evidence for a later date, and he may have been set aside for simony.

His famous theological handbook, *Sententiarum libri quatuor*, is, as the title implies, primarily a collection of opinions of the fathers, "sententiae patrum." These are arranged, professedly on the basis of the aphorism of Augustine, Lombard's favourite authority, that "omnis doctrina vel rerum est vel signorum," into four books, of which the first treats of God, the second of the creature, the third of the incarnation, the work of redemption, and the virtues, and the fourth of the seven sacraments and eschatology. The *Sententiae* show the influence of Abelard, both in method and arrangement, but lack entirely the daring of *Sic et Non*. Compared with that book they are tame. Gratian's *Concordia discordantium canonum*, as he called his Decretum, was another strong influence, Lombard doing in a sense for theology what Gratian did for the canon law. The influence of Hugh of St Victor is also marked. The relation to the "sentences" of a Gandulph of Bologna (still unpublished) has not been established. The most important thing in the book was its crystallization of the doctrine concerning the sacramental system, by the definite assertion of the doctrine of the seven sacraments, and the acceptance of a definition of sacrament, not merely as "a sign of a sacred thing," but as itself "capable of conveying the grace of which it is the sign." The sentences soon attained immense popularity, ultimately becoming the textbook in almost every theological school, and giving rise to endless commentaries, over 180 of these being written in England. In 1300 the theological professors of Paris agreed in the rejection of sixteen propositions taken from Lombard, but their decision was far from obtaining universal currency.

Besides the *Sententiae*, Lombard wrote numerous commentaries (*e.g.* on the Psalms, Canticles, Job, the Gospel Harmony, and the Pauline Epistles), sermons and letters, which still exist in MS. The *Glossae seu commentarius in psalmos Davidis*, were first published at Paris in 1533.

Lombard's collected works have been published in J. P. Migne's *Patrologie latine*, tomes 191 and 192. See also Denifle and Chatelain, *Chartularium universitatis parisiensis*, tome i. (Paris, 1889); Protois, *Pierre Lombard, son époque, sa vie, ses écrits, son influence* (Paris, 1881); Kögel, *Petrus Lombard in seiner Stellung zur Philosophie des Mittelalters* (Leipzig, 1897); A. Harnack, *Dogmengeschichte*, Bd. iii. (1890; Eng. trans. 1894–1899); and the article in Herzog-Hauck's *Realencyklopadie*, Bd. xi. (Leipzig, 1902).

PETER OF AIGUEBLANCHE (d. 1268), bishop of Hereford, belonged to a noble family of Savoy and came to England in 1236 with his master, William of Savoy, bishop of Valence, being in attendance on Eleanor of Provence, the bride of Henry III. A year or two later he is found residing permanently in England as a member of the king's court; before 1239 he was archdeacon of Salop, and in 1240 he was chosen bishop of Hereford. In 1255 Peter acted as Henry's principal agent in the matter of accepting the kingdom of Sicily from Pope Alexander IV. for his son Edmund, and his rapacious and dishonest methods of raising money for this foolish enterprise added not a little to the unpopularity which surrounded the king and his foreign favourites. When civil war broke out between Henry and his barons the bishop remained loyal to his master, and whilst residing, almost for the first time, at Hereford he was taken prisoner in May 1263. He was, however, released when the king and his enemies came to terms, and after a stay in France he retired to Savoy, where he died on the 27th of November 1268.

See F. Mugnier, *Les Savoyards en Angleterre au XIIIe siècle et Pierre d'Aigueblanche* (Chambéry, 1890).

PETER OF BLOIS [PETRUS BLESENSIS] (*c.* 1135–*c.* 1205), French writer, the son of noble Breton parents, was born at Blois. He studied jurisprudence at Bologna and theology in Paris, and in 1167 he went to Sicily, where he became tutor to the young king William II., and keeper of the royal seal (*sigillarius*). But he made many enemies and soon asked permission to leave the country; his request was granted and about 1170 he returned to France. After spending some time teaching in Paris and serving Rotrou de Perche, archbishop of Rouen, as secretary, Peter entered the employ of Henry II. of England about 1173. He quickly became archdeacon of Bath and soon afterwards chancellor, or secretary, to Richard, archbishop of Canterbury, and to Richard's successor, Baldwin, being sent on two occasions to Italy to plead the cause of these prelates before the pope. After the death of Henry II. in 1189, he was for a time secretary to his widow, Eleanor, in Normandy; he obtained the posts of dean of Wolverhampton and archdeacon of London, but he appears to have been very discontented in his later years. He died some time after March 1204.

Peter's writings fall into four classes, letters, treatises, sermons and poems. His *Epistolae*, which were collected at the request of Henry II., are an important source for the history of the time; they are addressed to Henry II. and to various prelates and scholars, including Thomas Becket and John of Salisbury. His treatises include *De Ierosolymitana peregrinatione acceleranda*, an exhortation to take part in the third crusade, and *Dialogus inter regem Henricum II. et abbatem Bonaevallensem*; his extant sermons number 65 and his poems are unimportant. Peter's works have been printed in several collections, including the *Patrologia* of J. P. Migne and the *Historiae francorum scriptores* of A. Duchesne. Of separate editions the best are those by Pierre de Goussainville (Paris, 1667) and J. A. Giles (Oxford, 1846–1847).

See the *Histoire littéraire de la France*, tome xv.; W. Stubbs, *Lectures on Medieval and Modern History* (Oxford, 1886); Sir T. D. Hardy, *Descriptive Catalogue of Materials relating to the History of Great Britain* (1862–1867), and C. L. Kingsford in vol. xlv. of the *Dictionary of National Biography* (1896).

PETER OF COURTENAY (d. 1219), emperor of Romania (or Constantinople), was a son of Peter of Courtenay (d. 1183), and a grandson of the French king, Louis VI. Having, by a first marriage, obtained the counties of Nevers and Auxerre, he took

for his second wife, Yolande (d. 1219), a sister of Baldwin and Henry of Flanders, who were afterwards the first and second emperors of the Latin Empire of Constantinople. Peter accompanied his cousin, King Philip Augustus, on the crusade of 1190, fought against the Albigenses, and was present at the battle of Bouvines in 1214. When his brother-in-law, the emperor Henry, died without sons in 1216, Peter was chosen as his successor, and with a small army set out from France to take possession of his throne. Consecrated emperor at Rome, in a church outside the walls, by Pope Honorius III. on the 9th of April 1217, he borrowed some ships from the Venetians, promising in return to conquer Durazzo for them; but he failed in this enterprise, and sought to make his way to Constantinople by land. On the journey he was seized by the despot of Epirus, Theodore Angelus, and, after an imprisonment of two years, died, probably by foul means. Peter thus never governed his empire, which, however, was ruled for a time by his wife, Yolande, who had succeeded in reaching Constantinople. Two of his sons, Robert and Baldwin, became in turn emperors of Constantinople.

PETER OF DUISBURG (d. *c.* 1326), German chronicler, was born at Duisburg, and became a priest-brother of the Teutonic Order. He wrote the *Chronicon terrae Prussiae*, dedicated to the grand-master, Werner of Orseln, which is one of the chief authorities for the history of the order in Prussia. There is a rhyming translation in German by Nicholas of Jeroschin, which, together with the original, is published in Bd. I. of the *Scriptores rerum prussicarum* (Leipzig, 1861).

See M. Töppen, *Geschichte der preussischen Historiographie* (Berlin, 1853); and W. Fuchs, *Peter von Duisburg und das Chronicon olivense* (Königsberg, 1884).

PETER OF MARICOURT (13th century), a French savant, to whom his disciple, Roger Bacon, pays the highest tribute in his *opus tertium* and other works. According to Bacon he was a recluse who devoted himself to the study of nature, was able to work metals, invented armour and assisted St Louis in one of his expeditions more than his whole army. According to Émile Charles (*Roger Bacon sa vie, ses ouvrages, ses doctrines*, 1861), Peter of Maricourt is the Pierre Pérégrin (or Pèlerin) de Maricourt (Méharicourt in Picardy), known also as Petrus Peregrinus of Picardy, one of whose letters, *De magnete*, is partly reproduced in Libri's *Hist. des sciences mathématiques en Italie* (1838), ii. 70–71, 487–505.

PETER OF SAVOY (*c.* 1203–1268), earl of Richmond, younger son of Thomas I. (Tommaso), count of Savoy, was born at Susa. After spending some years as an ecclesiastic he resigned his preferments, and in 1234 married his cousin Agnes, daughter and heiress of Aymon II., lord of Faucigny. Accepting an invitation from the English king, Henry III., who had married his niece, Eleanor of Provence, Peter came to England in 1240, and was created earl of Richmond, receiving also large estates and being appointed to several important offices. During several visits to the continent of Europe Peter had largely increased his possessions in Vaud and the neighbourhood, and returning to England in 1252 he became associated with Simon de Montfort, retaining at the same time the king's friendship. Having been employed by Henry to negotiate with the pope and with Louis IX. of France, he supported Earl Simon in his efforts to impose restrictions upon the royal power; but, more moderate than many members of the baronial party, went over to Henry's side in 1260, and was consequently removed from the council. In 1263 he left England, and when his nephew, Boniface, count of Savoy, died in the same year he assumed the title of count of Savoy. This was also claimed by another nephew, Thomas; but Peter compelled the inhabitants of Turin to submit to him and secured possession of the county. He died on the 16th or 17th of May 1268, leaving an only child, Beatrice (d. 1310). Peter gave to the castle of Chillon its present form, and his name to the Savoy palace in London. He has been called *le petit Charlemagne*, and was greatly praised for his valour and his wisdom.

See L. Wurstemberger, *Peter der Zweite, Graf von Savoyen* (Zürich 1858); F. Mugnier, *Les Savoyards en Angleterre* (Chambéry, 1890); and C. Bémont, *Simon de Montfort* (Paris, 1884).

PETER THE HERMIT, a priest of Amiens, who *may*, as Anna Comnena says, have attempted to go on a pilgrimage to Jerusalem before 1096, and have been prevented by the Turks from reaching his destination. It is uncertain whether he was present at Urban's great sermon at Clermont in 1095; but it is certain that he was one of the preachers of the crusade in France after that sermon, and his own experience may have helped to give fire to his eloquence. He soon leapt into fame as an emotional revivalist preacher: his very ass became an object of popular adoration; and thousands of peasants eagerly took the cross at his bidding. The crusade of the *pauperes*, which forms the first act in the first crusade, was his work; and he himself led one of the five sections of the *pauperes* to Constantinople, starting from Cologne in April, and arriving at Constantinople at the end of July 1096. Here he joined the only other section which had succeeded in reaching Constantinople—that of Walter the Penniless; and with the joint forces, which had made themselves a nuisance by pilfering, he crossed to the Asiatic shore in the beginning of August. In spite of his warnings, the *pauperes* began hostilities against the Turks; and Peter returned to Constantinople, either in despair at their recklessness, or in the hope of procuring supplies. In his absence the army was cut to pieces by the Turks; and he was left in Constantinople without any followers, during the winter of 1096–1097, to wait for the coming of the princes. He joined himself to their ranks in May 1097, with a little following which he seems to have collected, and marched with them through Asia Minor to Jerusalem. But he played a very subordinate part in the history of the first crusade. He appears, in the beginning of 1098, as attempting to escape from the privations of the siege of Antioch—showing himself, as Guibert of Nogent says, a " fallen star." In the middle of the year he was sent by the princes to invite Kerbogha to settle all differences by a duel; and in 1099 he appears as treasurer of the alms at the siege of Arca (March), and as leader of the supplicatory processions in Jerusalem which preceded the battle of Ascalon (August). At the end of the year he went to Laodicea, and sailed thence for the West. From this time he disappears; but Albert of Aix records that he died in 1151, as prior of a church of the Holy Sepulchre which he had founded in France.

Legend has made Peter the Hermit the author and originator of the first crusade. It has told how, in an early visit to Jerusalem, before 1096, Christ appeared to him in the Church of the Sepulchre, and bade him preach the crusade. The legend is without any basis in fact, though it appears in the pages of William of Tyre. Its origin is, however, a matter of some interest. Von Sybel, in his *Geschichte des ersten Kreuzzuges* suggests that in the camp of the *pauperes* (which existed side by side with that of the knights, and grew increasingly large as the crusade told more and more heavily in its progress on the purses of the crusaders) some idolization of Peter the Hermit had already begun, during the first crusade, parallel to the similar glorification of Godfrey by the Lorrainers. In this idolization Peter naturally became the instigator of the crusade, just as Godfrey became the founder of the kingdom of Jerusalem and the legislator of the assizes. This version of Peter's career seems as old as the *Chanson des chétifs*, a poem which Raymond of Antioch caused to be composed in honour of the Hermit and his followers, soon after 1130. It also appears in the pages of Albert of Aix, who wrote somewhere about 1130; and from Albert it was borrowed by William of Tyre. The whole legend of Peter is an excellent instance of the legendary amplification of the first crusade—an amplification which, beginning during the crusade itself, in the " idolizations " of the different camps (*idola castrorum*, if one may pervert Bacon), soon developed into a regular saga. This saga found its most piquant beginning in the Hermit's vision at Jerusalem, and there it accordingly began—alike in Albert, followed by William of Tyre and in the *Chanson des chétifs*, followed by the later *Chanson d'Antioche*.

The original authorities for the story of Peter the Hermit are: for the authentic Peter, Anna Comnena and the *Gesta Francorum*;

for the legendary Peter, Albert of Aix. The whole career of the Hermit has been thoroughly and excellently discussed by H. Hagenmeyer, *Peter der Heremite* (Leipzig, 1879). (E. Br.)

PETER THE WILD BOY (*fl.* 1725–1785), a Hanoverian imbecile of unknown parentage, who, having been found living wild in the woods near Hanover in 1725, was brought to England by order of George I., whose interest had been aroused in the unfortunate youth. An extraordinary amount of curiosity and speculation concerning Peter was excited in London, and the craze was the subject of a biting satire by Swift, and of another entitled *The Most Wonderful Wonder that ever appeared to the Wonder of the British Nation*, which has been attributed to Swift and Arbuthnot; Defoe also wrote on the subject, and Lord Monboddo in his *Origin and Progress of Language* presents the idiot Peter as an illustration of his theory of the evolution of the human species. He lived to an advanced age, was seen by Lord Monboddo in 1782, and died in 1785.

See Henry Wilson, *The Book of Wonderful Characters* (London, 1869).

PETER, EPISTLES OF, the two books of the New Testament traditionally ascribed to the apostle Peter

1 Peter

This epistle is addressed to "the elect who are sojourners of the Dispersion [Diaspora] in Pontus, Galatia, Cappadocia, Asia and Bithynia." The "Diaspora" was the name generally given to the Jews who were "scattered abroad." This suggests that the letter was intended for Jewish Christians in the provinces mentioned. But i. 14, 18; ii. 9, 10; iv. 3 point rather to Gentile Christians, and it is better to take this view, and interpret the "Diaspora" metaphorically as referring to the isolated position of Christians among the heathen. The general impression made by the epistle is that the central idea was to strengthen the courage of the recipients, who were likely to undergo persecution, and to enjoin on them conduct which would remove all reasonable excuse for thinking that Christianity ought to be regarded as a crime.

Ch. i. 3–12 is an introduction of praise to God that he had caused the recipients of the epistle to be born again to the living hope in a glorious salvation. The rest of the epistle may be divided into three parts: (α) i. 13–ii. 10, mainly hortatory injunctions to live holy lives in accordance with this new birth, and to grow up as God's people in communion with Christ; (β) ii. 11–iv. 6, particular directions as to the line of conduct to be pursued towards the Gentiles and towards those in authority, with special reference to the relations of slaves to masters, of wives and husbands to each other, and of Christians to one another; to the first of these a passage is appended dealing with the sufferings of Christ as an example (ii. 21–25), and the whole is completed by an exhortation to meekness and patience in suffering, in the light of the sufferings of Christ and the blessings given by them both to the living and to the dead; (γ) iv. 7–v. 11, has less cohesion. It begins with exhortations not to forget prayer and love, then the believers are warned to be careful to suffer only as Christians, not as breakers of the laws. The elders and the younger men are reminded of their duties to the community and to one another. The whole is brought to a close with an exhortation to all to fight manfully against the devil and to trust in God.

Date and Authorship.—These two questions are so closely connected that they cannot be considered separately. The external evidence of tradition is that the epistle was written by St Peter. This can be traced back to Irenaeus (iv. 9, 2) and Clement of Alexandria (*Strom.* iii. 18, 110), and it is thought by many writers that 2 Peter iii. 1, even if it be not itself Petrine, is good evidence that the writer regarded 1 Peter as apostolic. Evidence for its use, without mention of its name, may be found in Polycarp, but probably not in the other apostolic fathers (cf. *The N.T. in the Apostolic Fathers*, Oxford, 1905, p. 137). It is, however, possible that Papias made use of it. It is doubtful whether Justin Martyr used it, but probable that it was known to Theophilus of Antioch. It is not mentioned in the canon of Muratori. Thus external evidence, though unanimous in favour of the Petrine authorship, is not sufficient to settle the question. The internal evidence consists of (α) evidence bearing on the date in connexion with the persecution of Christians, (β) evidence establishing the relation of the epistle to other documents in early Christian history, and (γ) evidence concerning St Peter personally.

(α) It is clear from 1 Peter i. 6, ii. 12, iv. 12–19, v. 9, that the epistle was written during a time of persecution. The question which is doubtful is to which persecution the description best applies. The traditional opinion was that the persecution referred to was that under Nero. But it has been argued that the Neroine persecution according to Tacitus (*Ann.* xv. 44) was not a persecution of Christians as such, but was rather the result of false accusation. Moreover there is no proof that there was any persecution of Christians at this time outside Rome, and 1 Peter alludes to persecution in the provinces of Asia Minor. Therefore many critics have felt obliged to bring the epistle into connexion with the epistle of Pliny to Trajan, written *c.* 112, and asking for advice as to the procedure to be followed in trials of Christians. This is the earliest evidence which implies organized persecution in the provinces in question, and therefore Holtzmann, Weizsäcker and others regard this as fixing the date of the epistle in the beginning of the 2nd century, and excluding the Petrine authorship. Against this view it may be argued that the epistle describes the beginning of persecution. The writer still hopes that Christians will not be obliged to suffer "for the name" and is clearly aware of false accusations of crime. On the other hand, Pliny's letter implies a time when Christianity was in itself a crime and was recognized as such. Thus it is urged, probably correctly, that the epistle belongs to the beginning of a period of which Pliny's letter marks a later development, and we can only say that *c.* 112 is the *terminus ad quem*. The *terminus a quo* is more difficult to find. We do not know with certainty when Christianity became a recognized offence, and scholars have supported various hypotheses. T. Mommsen, Hardy and Sanday think that even under Nero it was criminal to be a Christian; Neumann thinks that this was first the case under Domitian; Sir W. M. Ramsay believes that this attitude was one of the results of the Jewish War of 70, and ascribes it to Vespasian. If the Domitianic date be adopted the Petrine authorship is almost excluded, and it is difficult to reconcile the traditional date of St Peter's martyrdom with Ramsay's theory.

(β) The relations of 1 Peter to other books in early Christian literature is shown in the following table :—

1 Pet. Rom.	1 Pet. Eph.	1 Pet. Jas.	1 Pet. Polycarp.
i. 14 — xii. 2	i. 1 seq. — i. 3 seq.	i. 1 — i. 1	i. 8 — i. 3
ii. 5 — xii. 1	i. 14 — ii. 3	i. 6 seq. — i. 2 seq.	i. 13 — ii. 1
ii. 6–10 — ix. 32	ii. 18 — vi. 5	i. 24 — i. 10	i. 21 — ii. 1
ii. 13 — xiii. 1	iii. 1 — v. 22	i. 23 — i. 18	ii. 11 — v. 3
iii. 9 — xii. 17	iii. 22 — i. 20	iv. 8 — v. 20	ii. 12 — x. 2
iii. 22 — viii. 34	v. 5 — v. 2	v. 5 seq. — iv 6, 10	ii. 21 — viii. 1, 2
iv. 3 — xiii. 11			iii. 9 — ii. 2
iv. 7 — xiii. 12			iv. 7 — vii. 2
iv. 9 — xiii. 13			iv. 16 — viii. 2
iv. 10 — xii. 6			

From this table it is sufficiently plain that 1 Peter is closely connected with Romans, Ephesians, James and Polycarp. The majority of scholars are agreed that in the case of Romans the dependence is on the side of 1 Peter, and in the case of Polycarp on the side of Polycarp. There is less agreement as to Ephesians and James, though in the former case the general opinion favours the dependence of 1 Peter, in the latter case its priority. In England, however, the priority of James has been supported by Mayor and Hort. In the light of the established use of Romans it is possible that 1 Peter also used other Pauline epistles and some scholars have seen special traces of the influence of 1 Cor. and Gal. (for a list of these cf. Holtzmann, *Einleitung in das N.T.*, 3, p. 314). It has been argued that the use of the Pauline epistles is improbable for Peter, but this is a subjective argument which is not decisive.

(γ) According to tradition Peter was martyred in Rome, and it is probable that this was in the Neroine persecution. If this be so, the year 64 is the *terminus ad quem* of the letter, if it be authentic. Ramsay, however, thinks that Peter may have survived this persecution and suffered at the beginning of the persecutions which, he thinks, were initiated by the Flavian emperors (see PETER, ST: § 5, 4 and 6).

The whole question of authorship and date is thus a complex of smaller problems, many of which do not seem to admit of any definite answer. If St Paul's epistle to the Ephesians be genuine, and it were really known to the writer of 1 Peter, and if Peter were martyred in 64, the theory of Petrine authorship demands that it was written by Peter between 59 and 64. On the Petrine hypothesis this is the most probable view. The weak point is that it assumes a great spread of Christianity in the provinces of Asia Minor outside the activity of Paul, and that the official persecution of Christians as such began throughout the Roman Empire under Nero, for neither of which is there

corroborative evidence. On the non-Petrine hypothesis a date is demanded some time before the letter of Pliny; this suits the internal evidence better than any possible on the Petrine hypothesis, but it fails to explain the really considerable and early evidence for the Petrine authorship, and necessitates some purely hypothetical suggestion, such as Harnack's view that the epistle was originally anonymous, and that the opening and closing sentences (i. 1 sqq., v. 12 sqq.) were added between A.D. 150 and 175, perhaps by the writer of 2 Peter.

The Provenance of the Epistle.—This is defined in 1 Peter v. 13 as Babylon. It has sometimes been argued that this is Babylon in Mesopotamia, in which there were, until the time of the emperor Caius, many Jews; but no good tradition connects St Peter with the evangelization of Mesopotamia, and this district would have had little in common with the Graeco-Roman world of Asia Minor. Another suggestion is that the Egyptian Babylon is meant (Old Cairo); but in the 1st century this was probably merely a fortress. Thus there is an overwhelming weight of opinion in favour of the view that Rome, the Babylon of Apocalyptic literature, is intended. This also agrees with the tradition in 2 Tim. iv. 11, which (cf. 1 Pet. v. 13) suggests that St Mark was in Rome.

Reception in the Canon.—1 Peter seems to have been the earliest of the Catholic epistles to obtain recognition. By the year 200 it was accepted everywhere except in two places—the church of Edessa, which did not receive the Catholic epistles until the 5th century, and, if the canon of Muratori is to be trusted, the church of Rome. It should, however, be noted that Zahn emends the text of the Muratorianum (rather violently) so as to include the epistle (see also BIBLE: *New Testament Canon*).

The Theology of 1 Peter.—The simplicity of the theology is marked, and affords an argument for an early date. Jesus is the Messiah of whom the prophets had spoken, and the "Spirit of Christ" is identified with the spirit which was in them. His suffering for sin had rescued the elect, and was also an example for Christians to follow. After his death he preached to the "spirits in prison." The source of Christian life is on the one hand belief in God who raised the Messiah from the dead, and on the other hand baptism which "saves . . . through the resurrection of Jesus Christ." The members of the community are "a royal priesthood, a holy nation"—*i.e.* inherit the promises made to the Jews, but this inheritance is bound up with the strongly eschatological doctrine that Christians are strangers in the world, the end of which is at hand.

The Church Organization of 1 Peter.—This also is very simple and primitive, and closely based on the Jewish model. The leaders are called presbyters or elders, and their duty is to act as shepherds to the flock. Beyond this there is no sign of a developed organization: each is to act in accordance with the gift (χάρισμα) which he has received. There is no trace of a specially set apart ministry either for the service of the community or for teaching, as to which the only limitation given is "If any man speak let him speak as the oracles of God," *i.e.* probably, in accordance with the Old Testament.

2 PETER

This epistle may be divided into five parts. (1) The writer who describes himself as "Simon (var. lect. Symeon) Peter, a servant and apostle of Jesus Christ," exhorts his readers to become perfect in knowledge and virtue, so as to enter the kingdom of Christ (i. 3–11). (2) He then explains his desire once more to testify to the power of Jesus, and bases his testimony partly on his own experience in the Holy Mount (apparently a reference to the Transfiguration), and partly on the "word of prophecy" (i. 12–21). (3) The mention of prophecy leads him to deal with the question of false prophets, who are accused of false doctrine and immoral practices. In this section is incorporated almost the whole of the epistle of Jude (ii. 1–22). (4) He then discusses a special feature of the false teaching, viz. doubts thrown on the *Parousia*, the certainty of which for the future he defends (iii. 1–13). Finally he warns his hearers that they must be found spotless at the *Parousia*, and emphasizes the agreement of his teaching with St Paul's (iii. 14–18).

The main object of the epistle is to be seen in the attack made on the false teachers, and in the defence of the certainty of the *Parousia* of the Lord

Authorship.—The traditional view is that it was written by St Peter from Rome after 1 Peter. This view is however untenable for the following reasons: (1) The epistle is not quoted by any writer of the 2nd century, and Origen, who is the first to mention it as Petrine, admits that its authorship was disputed. (2) The style and language differ greatly from that of 1 Peter: this argument may however fairly be met by the suggestion that it is improbable that he wrote Greek with ease, and that he may have used a variety of amanuenses. (3) The growth of immorality and false teaching to which it witnesses seems irreconcilable with a very primitive period of church life. (4) It has incorporated the greater part of Jude in a wholesale manner difficult to reconcile with apostolical authorsbip. (5) It seems to attribute a position of scriptural authority to the Pauline epistles, and this is improbable either in the mouth of Peter, or during the 1st century.

Any one of these arguments would be weighty by itself; in combination they form an irresistible cumulative argument against the Petrine authorship of 2 Peter.

Date.—If the Petrine authorship be abandoned, the *terminus ad quem* of the epistle is its use by Origen (or, just possibly, by Clement of Alexandria), and the *terminus a quo* is fixed by the following considerations: (1) the activity of an immoral Gnosticism; (2) the attainment by the Pauline epistles of great authority, and their perversion by heretics; (3) the use made of the epistle of Jude.

It is difficult to define the exact date to which these indications point, but there is a general agreement that it must be sought in the 2nd century, and perhaps the decades immediately before and after the year A.D. 150 are the most probable.

Place of Origin.—There is hardly any evidence on this point; but the most probable place seems to be Egypt, as the letter has points of connexion with Philo, Clement of Alexandria and the Apocalypse of Peter, and seems first to have been used in the church of Alexandria. It should however be noted that Deissmann argues on lexical grounds in favour of Asia Minor (*Bibel Stud.* pp. 277–284).

Relation to other Early Christian Documents.—The documents with which 2 Peter has the greatest affinities are the epistle of Jude, and the Apocalypse of Peter, of which a fragment was found in Akhmim in 1892 by M. Bouriant. In each case the affinity is very close, and is capable of more than one explanation. Roughly speaking 2 Peter ii. reproduces Jude: it is possible therefore either that Jude is an epitome of 2 Peter or that the writer of 2 Peter used Jude. The former hypothesis has a few supporters, notably T. Zahn and Spitta, but most writers are emphatic in thinking that 2 Peter has incorporated Jude, and this view is almost certainly correct (see JUDE, EPISTLE OF). The connexion with the Apocalypse of Peter is more complicated: the evidence of a comparison between the two documents (which is made in full in F. H. Chase's article in Hastings's *Dictionary of the Bible*) is to show that either one document is dependent on the other, or both were written by the same person, or both come from the same circle. Of these theories there is least to be said for the dependence of the Apocalypse on 2 Peter, and perhaps most for the dependence of 2 Peter on the Apocalypse.

Reception in the Canon.—2 Peter was the last of the Catholic epistles to be accepted as canonical. It was first regarded as such in Alexandria, perhaps originally in connexion with the Apocalypse of Peter rather than with 1 Peter. Thence it passed into the canon used by the church of Constantinople, in the 4th century made its way into the Roman canon, and in the 6th was accepted last of all by the Syria church (see also BIBLE: *New Testament Canon*).

The Theology of 2 Peter.—The theology of the epistle is specially marked by two characteristics—its high Christology and its eschatological character. Christ is referred to as "our God and Saviour," and the fatherhood of God is apparently only regarded as referring to the Divine Son. The work of Christ was the redemption of the elect, and this redemption awaits its consummation in the *Parousia*. This is the central point of the teaching of the epistle and is obviously directed against that of the false prophets. The writer looks forward to the destruction of the present world by fire.

when the wicked, whether angels or men, who have been reserved for judgment will be finally condemned, and a new era of happiness for the elect will begin.

Church Organization.—There is very little in 2 Peter which throws light on church organization. From his silence it would appear that the monarchial episcopacy did not yet exist in the church to which the writer belonged, and perhaps the prophets were still the chief guides, but the argument from silence cannot be pressed. In any case the growth of false and immoral prophets, which ultimately led to the obsolescence and suppression of this order, was far advanced and was one of the reasons which led to the writing of the epistle.

Authorities.—Besides the books and articles already mentioned the following are important: F. H. Chase, "Peter" and "Epistles of Peter" in Hastings's *Dict. Bible*; P. W. Schmiedel, "Simon Peter" in the *Ency. Bib.*; Lightfoot, *S. Clement of Rome*, I, 201-315 and II 481-502; Harnack, *Altchr. Litt.* and *Chronologie* I (the relevant sections). The relevant sections in the Introductions of Holtzmann, T. Zahn, Jülicher, Salmon, Weiss and Moffat. The commentaries of Bigg, Mayor, F. Spitta, Kühl (in Meyer's *Commentary*), von Soden (in Holtzmann's *Commentary*), and Weiss.

(K. L.)

PETERBOROUGH, a town and port of entry of Ontario, Canada, and capital of Peterborough county, situated 70 m. N.E. of Toronto, on the Otonabee river and the Grand Trunk and Canadian Pacific railways. Pop. (1901), 11,239. The five falls of the Otonabee at this point, with a total descent of 50 ft., furnish power for a large and increasing number of manufacturing establishments, whilst its canalization as part of the Trent canal gives communication with Lake Ontario and Georgian Bay. Peterborough has an electric railway, and contains important manufactories of electrical machinery and supplies, iron and steel bridges, agricultural implements and cordage, saw, flour and woollen mills.

PETERBOROUGH, a city and municipal and parliamentary borough of Northamptonshire, England, 76 m. N. from London by the Great Northern railway; served also by the London & North Western, Great Eastern and Midland railways. Pop. (1891), 25,171; (1901), 30,872. It is built chiefly along the river Nene, on the north side, and on the western border of the Fen country.

The cathedral of St Peter is the third church that has occupied the site; the first, founded under Penda, king of the Mercians, about 656, was entirely destroyed by the Danes in 870, and the second, founded in King Edgar's reign, was accidentally burnt in 1116. The present building, founded in the following year, was, inclusive of the west front, 120 years in building, being consecrated on the 4th of October 1237. It embraces in all, however, eight periods of construction, and in no other building can the transition be better studied through the various grades of Norman to Early English, while the later addition is an admirable example of Perpendicular.

The erection proceeded as usual from east to west, and, while an increase in elegance and elaboration is observable in the later parts, the character of the earlier buildings was so carefully kept in mind that no sense of incongruity is produced. A series of uniform Decorated windows were added throughout the church in the 14th century, and their effect is rather to enhance than detract from the unity of design. The choir, early Norman, terminating in an apse, was founded in 1117 or 1118 by John de Sais or Sez, and dedicated in 1140 or 1143; the aisles of both transepts and the whole of the south transept were built by Martin of Bec, 1140-1155; the remaining portions of the transepts and the central tower, of three storeys, were completed by William de Waterville, 1155-1175; the nave, late Norman, was completed by Abbot Benedict, 1177-1193, who added a beautiful painted roof of wood; the western transepts, transitional Norman, were the work of Abbot Andrew, 1193-1200; the western front, actually a vast portico of three arches, the unique feature of the building, and one of the finest specimens of Early English extant, must have been built between 1200 and 1250, during which period there were several abbots; but there exists no record of its reconstruction. The lady chapel, built parallel with the choir by William Parys, prior, was consecrated in 1290; the bell-tower was erected by Abbot Richard between 1260 and 1274; the south-west spire, the pinnacles of the flanking tower of the west portal, and the enlargement of the windows of the nave and aisles were the work of Henry de Morcot in the beginning of the 14th century; the "new building" or eastern chapel in the Perpendicular style, begun in 1438, was not completed till 1528. In 1541 the church was converted into a cathedral, the abbot being made the first bishop. The extreme length of the building is 471 ft., and of the nave 211 ft., the breadth of the west front being 156; the height of the central tower, as reconstructed in the 14th century, was 150, that of the spires and tower of the west front is 156 ft. In 1643 the building was defaced by the soldiers of Cromwell, who destroyed nearly all the brasses and monuments, burnt the ancient records, levelled the altar and screen, defaced the windows, and demolished the cloisters. To obtain materials for repairs the lady chapel was taken down. In the latter part of the 18th century the church was repaved. In 1831 a throne, stalls and choir-screen were erected and other restorations completed. On account of the insecure state of the central tower in 1883 it was taken down; and its reconstruction, exactly as it stood with the exception of the four corner turrets added early in the 19th century, was completed in 1886. The choir was reopened in 1889 after being closed, for thorough restoration, for six years.

In 1895 the restoration of the west front and other parts was begun in the face of considerable adverse criticism; but the work was carried on with the utmost care. During the carrying out of this work many interesting discoveries were made, the most important being the site of the cruciform Saxon church, enclosed within a crypt under the south transept. Catherine of Aragon was interred in the cathedral in 1536, and Mary Queen of Scots in 1587, but the body of the Scottish queen was removed to Westminster Abbey in 1612. Both interments were superintended by Robert Scarlett the sexton, commonly known as "Old Scarlett," whose portrait, a copy of the original, hangs in the west transept. He died in 1594 at the age of 98. Of the monastic buildings there are some interesting remains. The cathedral is approached by a Norman gateway, above which is the chapel of St Nicholas, built by Abbot Benedict, and now used as the music school, and on the left the chapel of St Thomas Becket, built by Abbot Ashton in the 15th century as it stands, but originally Norman. The gateway to the bishop's palace, formerly the abbot's house, was built by Abbot Godfrey de Croyland in 1319, and the deanery gate by Abbot Kirton about 1520. One of the canonry houses is formed partly from a hall of the 13th century.

Peterborough is included for civil purposes in the parish of St John the Baptist, but for ecclesiastical purposes it is divided into four, the additional parishes being St Mary's Boongate (1857), St Mark's (1858) and St Paul's (1869). The old parish church of St John originally stood to the east of the cathedral, but was rebuilt on its present site in the centre of the city (1401-1407) in Perpendicular style. The educational establishments include the Henry VIII. grammar or chapter school, which used the chapel of St Thomas à Becket until 1885; the St Peter's training college for schoolmasters for the dioceses of Peterborough, Ely and Lincoln, erected from designs of Sir Gilbert Scott (1864); and Deacon's and Ireland's charity school, established in 1721 for the clothing and educating of twenty poor boys. The principal public building is the market house (1671), used as a town hall. The modern prosperity and rapid growth of the town are chiefly due to the trade caused by the junction of so many railways lines. Adjoining the town are extensive works and sheds connected with the Great Northern and Midland railways. The principal manufacture is that of agricultural implements. The parliamentary borough returns one member (since 1885). The municipal borough, incorporated in 1874, is under a mayor, 6 aldermen and 18 councillors. Area, 1878 acres. The soke or liberty of Peterborough, with a population of 41,122, constitutes a separate administrative county (1888). The diocese of Peterborough includes the whole of Rutland, nearly all Leicestershire and Northamptonshire, and small portions of Derbyshire and Huntingdonshire.

Peterborough (*Burgh, Burgus sancti Petri*) is proved by its original name Medehamstede to have been a Saxon village before 655 when Saxulf, a monk, founded the monastery on land granted to him for that purpose by Penda, king of Mercia. Its name was altered to Burgh between 992 and 1005 after Abbot Kenulf had made a wall round the minster, but the town does not appear to have been a borough until the 12th century. The burgesses received their first charter from "Abbot Robert," probably Robert of Sutton (1262-1273). Until the 19th century the dean and chapter, who succeeded the abbot as lords of the manor, appointed a high bailiff, and the constables and other borough officers were elected at their court leet, but the borough was incorporated in 1874 under the government of a mayor, 6 aldermen and 18 councillors. Among the privileges claimed by the abbot as early as the 13th century was that of having a prison for felons taken in the soke and borough. In 1576 Bishop Scamble sold the lordship of the hundred of Nassaburgh, which is coextensive with the soke, to Queen Elizabeth, who

gave it to Lord Burghley, and from that time until the 19th century he and his descendants, marquesses of Exeter, had a separate gaol in Peterborough for prisoners arrested in the soke. The trades of weaving and woolcombing were carried on in Peterborough in the 14th century. The abbot formerly held four fairs, of which two, one called St Peter's fair, granted in 1189 and now held on the second Tuesday and Wednesday in July, and the other called the Bridge fair, granted in 1439 and held on the first Tuesday, Wednesday and Thursday in October, still survive and were purchased by the corporation from the ecclesiastical commissioners in 1876. Peterborough sent two members to parliament for the first time in 1547.

PETERBOROUGH AND MONMOUTH, CHARLES MORDAUNT, Earl of (*c.* 1658–1735), English soldier and statesman, was born about 1658. His father, John Mordaunt, was created Viscount Mordaunt of Avalon and Baron Mordaunt of Reigate, Surrey, in 1659;[1] his mother was Elizabeth, the daughter and sole heiress of Thomas Carey, the second son of Robert Carey, 1st earl of Monmouth.[2] He matriculated at Christ Church, Oxford, on the 11th of April 1674. When about sixteen years of age he joined Sir John Narborough's fleet in the Mediterranean, and won his first distinction in arms in the destruction of the dey's fleet under the very guns of Tripoli. His father died on the 5th of June 1675, and Charles Mordaunt succeeded to the peerage as Viscount Mordaunt. On his return from the second expedition to Tangier he plunged into active political life as a zealous Whig and an unswerving opponent of the duke of York. But his continued hostility to James II. forced him to repair to Holland in 1686, when he proposed to William of Orange to invade England. The disposition of the cold and cautious William had little in common with the fierce and turbulent Mordaunt. His plan was rejected, though the prudent prince of Orange deemed it judicious to retain his services. When William sailed to Torbay his friend accompanied him, and when the Dutch prince was safely established on the throne of England honours without stint were showered upon Lord Mordaunt. He was sworn of the privy council on the 14th of February 1689, on the 8th of April of the same year appointed first lord of the treasury, and a day later advanced in the peerage by creation as earl of Monmouth.

In less than a year he was out of the treasury, but he still remained by the person of his monarch and was with him in his dangerous passage to Holland in January 1691. He was one of the eighteen peers who signed the protest against the rejection, on the 7th of December 1692, of the motion for the appointment of a committee to inquire into the conduct of the war, and although William had refused his consent to a bill for triennial parliaments in the previous session, Lord Monmouth did not shrink from reintroducing it in December 1693. This led to a disagreement with the court, though the final breach did not take place until January 1697, when Monmouth was accused of complicity in Sir John Fenwick's conspiracy and of the use of "undutiful words" towards the king. He was committed to the Tower, staying in confinement until the 30th of March 1697, and deprived of his employments. Some consolation for these troubles came to him on the 19th of June of the same year, when he succeeded to the earldom of Peterborough, by the death of his uncle Henry Mordaunt, 2nd earl.

The four years after his release from the Tower were mainly passed in retirement, but on the accession of Anne he plunged into political life again with avidity. His first act was to draw down on himself in February 1702 the censure of the House of Commons for the part which he took in the attempt to secure the return of his nominee for the borough of Malmesbury. Through the fear of the ministry that his restless spirit would drive him into opposition to its measures if he stayed at home, he was appointed early in 1705 to command an expedition of English and Dutch troops in Spain. He was created the sole commander of the land forces in April 1705 and joint-commander with Sir Cloudesley Shovel of the fleet on the 1st of May, after he had been reinstated a member of the privy council on the 29th of March. He arrived at Lisbon on the 20th of June 1705, sailed for Barcelona (Aug. 1705) on an expedition for the conquest of Catalonia, and began to besiege that town. For some weeks the operations were not prosecuted with vigour and Peterborough urged that the fleet should transport the troops to Italy, but the energetic counsels of the Archduke Charles at last prevailed and by the 14th of October the city fell into his hands. On the 24th of January 1706 he entered Valencia in triumph, but these movements had weakened the garrison at Barcelona, which was now besieged by a superior French force under Tessé. The garrison, commanded by the archduke, defended their positions with great bravery, but would have been obliged to surrender had not the fleet of Sir John Leake, answering the appeals of Charles but contrary to the original orders of Peterborough, come to their assistance on the 8th of May, whereupon the French raised the siege on the 11th of May. It is difficult to understand the action of Peterborough during this campaign, unless on the supposition that he was out of sympathy with the movement for placing an Austrian prince on the throne of Spain. When Charles determined upon uniting with Lord Galway's troops and marching to Madrid, the advice of Peterborough again hindered his progress. At first he urged an advance by Valencia as supplies had there been collected, then he withdrew this statement; afterwards he delayed for some weeks to join Galway, who was in need of succour, but ultimately reached the camp on the 6th of August. The leaders of the army differed in their views, and Lord Peterborough was recalled to England to explain his conduct (March 1707).

On his return to England in August he allied himself with the Tories, and received his reward in being contrasted, much to his advantage, with the Whig victor of Blenheim and Malplaquet. The differences between the three peers, Peterborough, Galway and Tyrawley, who had served in Spain, formed the subject of angry debates in the Lords, when the majority declared for Peterborough; after some fiery speeches the resolution that he had performed many great and eminent services was carried, and votes of thanks were passed to him without any division (January and February 1708). His new friends were not desirous of detaining him long on English soil, and they sent him on a mission to Vienna, where he characteristically engaged the ministry in pledges of which they disapproved. His resentment at this disagreement was softened by the command of a cavalry regiment, and by his appointment as a Knight of the Garter (Aug. 3 and 4, 1713). With the accession of George I. Lord Peterborough's influence was gone. Worn out with suffering, he died at Lisbon on the 25th of October 1735. His remains were brought to England, and buried at Turvey in Bedfordshire on the 21st of November.

Lord Peterborough was short in stature and spare in habit of body. His activity knew no bounds. He was said to have seen more kings and postilions than any man in Europe, and the whole point of Swift's lines on "Mordanto" consisted in a description of the speed with which he hastened from capital to capital. He was eloquent in debate and intrepid in war, but his influence in the senate was ruined through his inconsistency, and his vigour in the field was wasted through his want of union with his colleagues. His first wife, Carey, daughter of Sir Alexander Fraser of Dores, Kincardineshire, died on the 13th of May 1709, and was buried at Turvey. Some years later (1722) he secretly married Anastasia Robinson (*c.* 1695–1755), a famous dramatic singer (from 1714) of great beauty and sweetness of disposition, daughter of Thomas Robinson (d. 1722), a portrait painter; but she was at first unrecognized as his wife, and lived apart from him (regarded merely as his mistress) with her two sisters at Parson's Green. She remained on the operatic stage, till 1724. It was only a few months before his death that (after a second marriage ceremony) she

[1] A barony of Mordaunt by writ had existed in the family since 1529, and the viscount was the second son of the fifth of these barons, who in 1628 was created earl of Peterborough, the elder son Henry being second earl.

[2] Cr. 1626. This peerage became extinct in 1661 on the death of the 2nd earl.

was introduced to society as the countess of Peterborough. He had a son John (1681–1710) who predeceased him, and was therefore succeeded in the title by his grandson Charles (1710–1779), whose son Charles Henry (1758–1814), 5th earl, died unmarried, the honours becoming extinct, except for the barony of Mordaunt, which passed to a collateral branch and fell into abeyance in 1836.

Bibliography.—The best accounts of the career of Peterborough are in the life by William Stebbing (1890), and the *War of the Succession in Spain*, by Colonel the Hon. Arthur Parnell (1905). The earlier lives are founded on the memoir of Captain George Carleton (1728), which was analysed by Colonel Parnell, and dismissed as a fictitious narrative inspired by Swift, in the *Eng. Hist. Rev.* (1891), vi. 97–151. (W. P. C.)

PETERHEAD, a municipal and police burgh, and seaport of Aberdeenshire, the most easterly town in Scotland. Pop. (1901), 11,794. It is situated about 33 m. by road E.N.E. of Aberdeen and 44¼ m. by rail, via Maud Junction, on the Great North of Scotland railway, from which there is a branch line. The town is built of the red granite for which it is famous, and the quarrying of which for home and foreign use constitutes an important industry. Among the principal buildings are the town house (1788), with a spire 125 ft. high, and the Arbuthnot museum and art gallery. In front of the town hall is a statue to Field Marshal Keith (born at Inverugie Castle, 2 m. north-west, in 1696), which was presented to the burgh in 1868 by William I. of Prussia, afterwards German emperor. Peterhead is one of the Elgin district group of parliamentary burghs, with Banff, Cullen, Elgin, Inverurie and Kintore. It formerly had an extensive trade with the ports of the Baltic, the Levant and America, and was once a sub-port to Aberdeen, but was made independent in 1832. It was also for a long period the chief seat of the Greenland trade, but the Arctic seal and whale fishery is now extinct. The north and south harbours lie between the town and Keith Inch—a suburb at the extremity of the peninsula on part of which the town is built—and the isthmus dividing them is pierced by a canal crossed by an iron swing-bridge. In the north harbour are two graving docks. A third harbour has been built, the area of the three basins amounting to 21 acres. In addition to the granite quarrying and polishing, the leading industries are ship- and boat-building, agricultural implement works and woollen manufactures. The herring fleet possesses more than 600 boats and the annual catch averages nearly £200,000. About a mile to the south is the convict prison for Scotland. Since 1886 the prisoners have been employed upon the construction of a vast harbour of refuge, for which the breakwater extends from Boddam Point northwards across the bay. This great undertaking (intended to be completed in 1921) was designed by Sir John Coode (d. 1892). Peterhead is the terminus of a cable to Norway. About 6 m. south of Peterhead are the famous Bullers, or Roarers, of Buchan, an enormous rocky cauldron into which the waves pour through a natural arch of granite, with incredible violence, in a storm.

The town and lands belonged of old to the Abbey of Deer, built in the 13th century by William Comyn, earl of Buchan; but when the abbey was erected into a temporal lordship in the family of Keith the superiority of the town passed to the earl marischal, with whom it continued till the forfeiture of the earldom in 1716. The town and lands were purchased in 1720 by a fishing company in England and, on their failure, by the Merchant Maidens' Hospital of Edinburgh for £3000, who are still the overlords. Peterhead, made a burgh of barony in 1593 by George Keith, fifth earl marischal, was the scene of the landing of the Pretender on Christmas Day 1715.

PETERHOF, a town of Russia, in the government of St Petersburg, 18 m. W. of the capital, on the south coast of the Gulf of Finland. It was founded in 1711 and has grown up round the palace built by Peter the Great in 1720; pop. 11,300. Peterhof is almost exclusively a residential town, but gem-cutting and the manufacture of agricultural implements are carried on. The palace has undergone alterations and additions, *e.g.* by Catharine II., but retains a distinct Petrine stamp. It is built on a height 50 ft. above the sea, and contains portraits of the Russian imperial family and other pictures. A statue of Peter the Great was set up near the palace in 1883, and one of Francis I. of France in 1896, a gift from the town of Havre to Nicholas II. Peterhof is connected with Oranienbaum on the west and with Stryelna on the east by a series of gardens and villas.

PETERMANN, AUGUST HEINRICH (1822–1878), German cartographer, was born at Bleicherode, near Nordhausen, on the 18th of April 1822. At the age of seventeen he entered the Geographical School of Art in Potsdam, and in 1845 proceeded to Edinburgh to assist Dr Keith Johnston in the production of an English edition of the *Physical Atlas* of Berghaus. In 1847 he came to London, and published, among other works, an account of Barth's expedition to Central Africa (1855). In 1854 he became director of the geographical institute of Justus Perthes in Gotha, and editor of the well-known *Petermanns Mitteilungen*. His work did much towards elucidating the geography of the interior of Africa and of the North Polar regions. Queen Victoria, at the suggestion of Bunsen, appointed him physical geographer-royal. Petermann died by his own hand at Gotha on the 25th of September 1878.

PETERS (or Peter), **HUGH** (1598–1660), English Independent divine, son of Thomas Dyckwoode, *alias* Peters, descended from a family which had quitted the Netherlands to escape religious persecution, and of Martha, daughter of John Treffry of Treffry in Cornwall, was baptized on the 29th of June 1598, and was educated at Trinity College, Cambridge. Having experienced conversion, he preached in Essex; returning to London he took Anglican orders and was appointed lecturer at St Sepulchre's. He entertained, however, unorthodox opinions, and eventually left England for Holland. He visited Gustavus Adolphus in Germany about 1632, and afterwards became the minister of the English church at Rotterdam. Here his unorthodox leanings again attracted attention, and Peters made a further move to New England. He was connected with John Winthrop through his wife, and had already formed several friendships with the American colonists. He arrived at Boston in October 1635 and was given charge of the church at Salem. He took a leading part in the affairs of the colony, and interested himself in the founding of the new colony in Connecticut. In 1641 he returned to England as agent of the colony, but soon became involved in the political troubles which now began. He became chaplain to the forces of the adventurers in Ireland, and served in 1642 in Lord Forbes's expedition, of which he wrote an account. On his return he took a violent part in the campaign against Laud, and defended the doctrines of the Independents in a preface to a tract by Richard Mather entitled "Church Government and Church Covenant discussed . . ." (1643). He gained great reputation as a preacher by his discourses and exhortations at public executions, and as army chaplain. In the latter capacity he accompanied Lord Warwick's naval expedition to Lyme in 1644 and Fairfax's campaigns of 1645 and 1646, when his eloquence is said to have had a marvellous effect in inspiring the soldiers and winning over the people. At the conclusion of the war, Peters, though greatly disliked by the Presbyterians and the Scots, had attained great influence as leader of the Independents. In his pamphlet "Last Report of the English Wars" (1646) he urged religious toleration, an alliance with foreign Protestants, and an active propagation of the gospel. In the dispute between the army and the parliament he naturally took the side of the former, and after the seizure of the king by the army in June 1647 had interviews with Charles at Newmarket and Windsor, in which he favourably impressed the latter, and gave advice upon the best course to pursue. He performed useful services in the second Civil War, procured guns for the besiegers at Pembroke, raised troops in the Midlands, and arranged the surrender of the duke of Hamilton at Uttoxeter. Though at the Restoration he denied any complicity in the king's death, it is certain that in his sermons he justified and supported the trial and sentence. In August he accompanied Cromwell to Ireland, and was present at the fall of Wexford,

while later he assisted the campaign by superintending from England the despatch to Cromwell of supplies and reinforcements, and was himself destined by Cromwell for a regiment of foot. In 1650 he was in South Wales, endeavouring to bring over the people to the cause, and subsequently was present at the battle of Worcester. At the conclusion of the war Peters was appointed one of the preachers at Whitehall and became a person of influence. Parliament had already voted him an annuity of £200, and Laud's library or a portion of it had been handed over to him in 1644. He was one of the committee of twenty-one appointed to suggest legal reforms, and he published his ideas on this subject, which included a register of wills and land titles and the destruction afterwards of the ancient records, in his tract, "Good Work for a Good Magistrate" (in 1651), answered by R. Vaughan and Prynne. He strongly disapproved of the war with Holland, and his interference brought upon him some sharp reprimands. In July 1658 he was sent to Dunkirk to provide apparently for the spiritual wants of the garrison. He preached the funeral sermon on Cromwell, and after the latter's death took little part in political events, though strongly disapproving of the removal of Richard. He met Monck at St Albans on the latter's march to London, but met with no favour from the new powers, being expelled from his lodgings at Whitehall in January 1660. On the 11th of May his arrest was ordered. On the 18th of June he was excepted from the Act of Indemnity and apprehended on the 2nd of September at Southwark. He sent in a defence of himself to the Lords, denying any share in the king's death. He was, however, tried on the 13th of October and found guilty of high treason. His execution took place at Charing Cross on the 16th of October, when he behaved with great fortitude, and was undismayed by the mangling of the body of John Cook, his fellow-sufferer, upon which he was forced to look. Before his death he wrote "A Dying Father's Last Legacy" to his only child, Elizabeth, in which he gave a narrative of his career.

His death was viewed with greater rejoicings than perhaps attended that of any of the regicides, which is the more surprising as Peters possessed many amiable qualities, and several acts of kindness performed by him on behalf of individual Royalists are recorded. But he had incurred great unpopularity by his unrestrained speech and extreme activity in the cause. He was a man, however, of a rough, coarse nature, without tact or refinement, of strong animal spirits, undeterred by difficulties which beset men of higher mental capacity, whose energies often outran his discretion, intent upon the realities of life and the practical side of religion. His conception of religious controversy, that all differences could be avoided if ministers could only pray together and live together, is highly characteristic, and shows the largeness of his personal sympathies and at the same time the limits of his intellectual imagination. Peters married (1) Elizabeth, daughter of Thomas Cooke of Pebmarsh in Essex and widow of Edmund Read, and (2) Deliverance Sheffield, by whom he had one daughter, Elizabeth.

PETERS, KARL (1856–   ), German traveller in Africa, one of the founders of German East Africa, was born at Neuhaus on the Elbe on the 27th of September 1856, the son of a Lutheran clergyman. He studied at Göttingen, Tübingen and Berlin, and in 1879 was awarded a gold medal by the Berlin University for his *Frieden zu Venedig*. After visiting London to study English principles of colonization, he returned to Berlin, and promoted the German Colonization Society (*Deutsche Kolonialverein*). In the autumn of 1884 he proceeded with two companions to East Africa, and concluded in the name of his society treaties with the chiefs of Useguha, Nguru, Usagara and Ukami. Returning to Europe early in 1885, he formed the German East Africa Company, which speedily obtained an imperial charter. The story of this enterprise, the first step in the formation of a German colony in East Africa, is told under AFRICA, § 5. In 1888 Peters undertook an expedition from the east coast of Africa, avowedly for the relief of Emin Pasha. This expedition was not sanctioned by the German government and was regarded by the British authorities as a filibustering exploit. One of its objects was to extend the sphere of German influence, and, reaching Uganda early in 1890, Peters concluded a treaty with the king of that country in favour of Germany. He left Uganda hastily on the approach of a representative of the British East Africa Company, and on reaching Zanzibar learned that his treaty was useless, as an agreement had been come to between Germany and Great Britain whereby Uganda was left in the British sphere. On his return to Germany Peters was received with great honours, and in 1891 published an account of his expedition entitled *Die deutsche Emin Pasha Expedition*, which was translated into English. In 1891 he went out again to East Africa as imperial high commissioner for the Kilimanjaro district, and in 1892 was one of the commissioners for delimiting the Anglo-German boundary in that region. In June 1892 accusations were brought against him of excesses in his treatment of the natives, and after three investigations had been held he was, in 1897, deprived of his commission for "misuse of official power." (He was regranted his title of imperial commissioner in 1906.) During 1893–1895 Peters was employed in the colonial office at Berlin. In 1896 he removed to London, where he occupied himself in schemes for exploiting parts of Rhodesia and Portuguese East Africa. In the interests of a company he formed, Peters explored the Fura district and Macombe's country on the Zambezi, where in 1899 he discovered ruins of ancient cities and deserted gold mines. He returned in 1901 and gave an account of his explorations in *The Eldorado of the Ancients* (1902). In 1905 he again visited the region between the Zambezi and Sabi rivers.

Besides the books already mentioned and some smaller treatises Peters published a philosophic work entitled *Willenswelt und Weltwille* (1883), and a disquisition on early gold production entitled *Das goldene Ophir Salomos* (1895), translated into English in 1898.

PETERSBURG, a city and port of entry of Virginia, U.S.A., on the Appomattox River, at the head of navigation, about 11 m. from its mouth, and 22 m. S. of Richmond. Pop. (1890). 22,680; (1900), 21,810, of whom 10,751 were negroes. It is served by the Atlantic Coast line, the Seaboard Air line, and the Norfolk & Western railways. The river, which is here spanned by two steel bridges and one frame bridge, is navigable to this point for vessels of 8 ft. draught at mean high water, and has been greatly improved by the Federal government, which in 1909 was engaged in deepening the whole channel to 12 ft. at mean high water and in excavating at Petersburg a new channel into which to deflect the river. In and about the city there is much of historic and scenic interest. At Blandford, a suburban hamlet, is the picturesque old Blandford church, erected about 1734. Petersburg has two public parks, and among its institutions are a home for the sick (1886), an orphanage for girls and another for negroes, the state central hospital for the insane (negroes), the southern female college (non-sectarian, 1863), the university school for boys, the Bishop Payne divinity school (Protestant Episcopal) for negroes, and the Virginia normal and industrial institute (opened in 1883), also for negroes. There are two national cemeteries near Petersburg—Poplar Grove (about 4 m. south), containing about 6200 graves, and City Point (about 9 m. east), containing about 5100 graves; and in Blandford cemetery there are about 30,000 graves of Confederate dead. In this cemetery General William Phillips is buried, and there is a monument to Captain McRae, commander of the "Petersburg Volunteers," whose bravery in 1812–1813 prompted President Madison to call Petersburg the "Cockade City." The falls above the city furnish abundant water-power, and the city has various manufactures. The factory product was valued at $5,890,574 in 1905, 11·3 % more than in 1900; in both 1900 and 1905 Petersburg ranked fourth among the cities of the state in the value of factory products. From Petersburg are shipped quantities of trunks and bags, peanuts, tobacco and cotton. In 1909 the foreign trade, wholly imports, was valued at $360,774. The city was formerly in Chesterfield, Dinwiddie and Prince George counties, but is now independent of county government.

An Indian village formerly stood on or near the site of the present city, and Fort Henry was built here by the whites in 1645. Petersburg was founded in 1733 by Colonel William Byrd (1674–1744) and Peter Jones, and was named (first Peter's Point, and then Petersburg) in honour of the latter; in 1748 it was incorporated as a town. On the 25th of April 1781 a skirmish was fought in front of Petersburg between a British force of about 3000 under General William Phillips (1731?–1781) and about one-third of that number of American militia under Baron Friedrich Wilhelm von Steuben; the Americans were defeated, and the British occupied the town. In the following month the British again entered Petersburg (General Phillips dying here on the 13th), but they were soon dislodged by Lafayette, who shelled the town. General Winfield Scott was born near Petersburg, and practised law here for two years before he entered the army. Petersburg was chartered as a city in 1850.

PETERSBURG CAMPAIGN (1864 65). The name of Petersburg is associated with operations in the American Civil War, which formed the sequel of the Wilderness Campaign (*q.v.*) and the last act in the struggle between the armies of Grant and Lee for supremacy. Petersburg (see above) and Richmond, Virginia, connected by rail and covered north, east and south by forty miles of entrenchments, formed the salients of a vast fortress, into which reinforcements and supplies could be poured from the rear by means of the James Canal, the Virginia Central, the Lynchburg, the Danville and the Weldon railroads—the latter bringing up to Petersburg from Wilmington (225 m. distant) the cargoes of blockade runners. Petersburg became a strategic point as soon as Grant determined to carry the army of the Potomac—defeated at Cold Harbor on the Chickahominy (see WILDERNESS CAMPAIGN)—south of Richmond, and, being joined by Butler's Army of the James (momentarily checked in the Bermuda Hundred Peninsula by a small army under Beauregard), to operate from the east, depending on the James River, as his line of supply, while the policy of the Confederate president was to employ Robert Lee's army to protect his capital. Petersburg was nearer than Richmond to the navigable part of the James River—City Point is only 10 m. distant—and the capture of Petersburg would involve the fall of Richmond and the capitulation or flight of Lee's army.

As early as the 9th of June 1864, while the main armies were still north of the James and Petersburg was garrisoned by a brigade under General Wise, a Federal expedition from the Army of the James approached the city. General Gillmore on the City Point road discovered strong earthworks, and General Kautz attacking on the Jerusalem Plank road experienced a repulse: the total force of the Federals was 4500, and Wise's brigade (2400) had been quickly reinforced from Beauregard's central position at Bermuda Hundred. A week later a more serious attempt was made to break through the defences, while General Lee's main army was detained north of Richmond. Grant detached the II. and XVIII. corps under Generals Smith and Hancock, who were to unite and operate along the City Point railroad and capture the outer line of works about 2 m. from Petersburg while a demonstration was made along the Norfolk railroad by cavalry under Kautz. On the 15th of June Smith attacked and captured five redans before Hancock came up, and when next day Burnside's corps (IX.) arrived and General Meade assumed control of the three corps, he attacked again at 6 p.m. On the 17th of June Warren's (V.) corps arrived, and Meade made a third assault with two corps (V., IX.). On the 18th of June the attack was renewed with three corps (II., V., IX.) late in the afternoon, and the results of the four days' fighting were so far satisfactory that ground was won which could be entrenched and held against any sortie of the Petersburg garrison. Probably on the 18th of June the town of Petersburg might have been captured by Meade, for at this crisis General Lee was in temporary eclipse. For four days Lee had refused to credit any report to the effect that Grant was crossing the James: his cavalry could not ascertain that the enemy in his front at Malvern Hill (VI. corps and Wilson's cavalry division), despite its menacing attitude towards Richmond, was only a flank guard for a movement to the south.

It was late on the 17th of June when General Beauregard, who had for three days valiantly held his main lines south of Richmond with some 14,000 infantry against three Federal corps, succeeded in convincing General Lee that the main army was again (as in 1862 on the Chickahominy) in the wrong place at the wrong time. But when at last the Confederate leader was aroused to a sense of his danger he soon filled every road with divisions marching to save Petersburg: they marched all night; they slept in the trenches on arrival, and on the 19th of June these reinforcements convinced General Meade that his main attack between the Appomattox River and the Jerusalem Plank road was delivered a day too late. At a cost of 10,000 casualties Meade had gained half a mile of ground, but the Confederates in falling back had concentrated, and now that the new plan of operations was exposed and the main bodies were again face to face the power of defensive tactics reasserted itself.

Yet June was not to close without adding some 8000 men to the Federal casualties, for in addition to daily losses by sharpshooting along the front, over 5000 men fell or were captured in operations directed against the southern railroads. Grant had resolved to deprive his enemy of these lines of supply: his plan was to prolong his line of investment westward and construct redoubts (such as Fort Davis, Fort Steadman and Fort Sedgwick) as a continual menace to the Confederate garrison and a defence against sorties, while his cavalry and portions of five corps (II., V., VI., IX. and XVIII.) engaged in enterprises which it was hoped would tempt General Lee to fight outside his works. A decisive victory in the field, a successful assault on the defences between Richmond and Petersburg, or the complete destruction of the railroads, would precipitate disaster to the South, and of these three methods the last would be the surest in its effects. But such a method was necessarily slow. General Wilson's cavalry (5500) destroyed 30 m. of the Lynchburg or South Side railroad, and 30 m. of the Danville railroad, together with Burkesville Junction and Ream's Station on the Weldon railroad; but Wilson was caught by the Confederate cavalry 100 m. from Petersburg and escaped only by destroying his wagons and limbers and abandoning twelve guns. Even the Virginia Central railroad could not be held by the Federals after Sheridan with the main body of the cavalry had been called back to White House on the Pamunkey to escort a great convoy.

By the end of June the whole of the rival forces were concentrated about the Richmond-Petersburg defences, and General A. P. Hill had already sallied out on the 21st of June to drive the II. corps from the Weldon railroad. Federal policy and Federal strategy, surmounting the crisis of Cold Harbor, were, however, at last in unison. Grant had a free hand in respect both of his dispositions and his resources in men and money, and had resolved to use unsparingly the resources placed at his disposal. Early in July Grant, however, found himself compelled to detach a corps (VI.) to strengthen the garrison at Washington, for General Early had frustrated Hunter's attempt against Lynchburg (see SHENANDOAH VALLEY), driving Hunter into West Virginia, and then, pushing down the Shenandoah and across the Potomac, had arrived within a day's march of the Federal capital. This operation checked Grant's enterprises about Petersburg and restricted the Federal front to the ground east of the Weldon railroad.

On the 25th of July Grant resolved to weaken the enemy on his front by a demonstration north of the James, and accordingly moved a corps (II.) and two cavalry divisions across the river to Malvern Hill under cover of Foster's corps (X.). But Lee possessed the inner line, and the Federal detachment found two cavalry divisions in its front, and the Richmond defences had been strengthened by three divisions of infantry. The expedition then returned to take part in a fresh enterprise, which ended disastrously to the Federals. A Confederate redan faced Burnside's IX. corps 100 yds. distant, and this strong work was

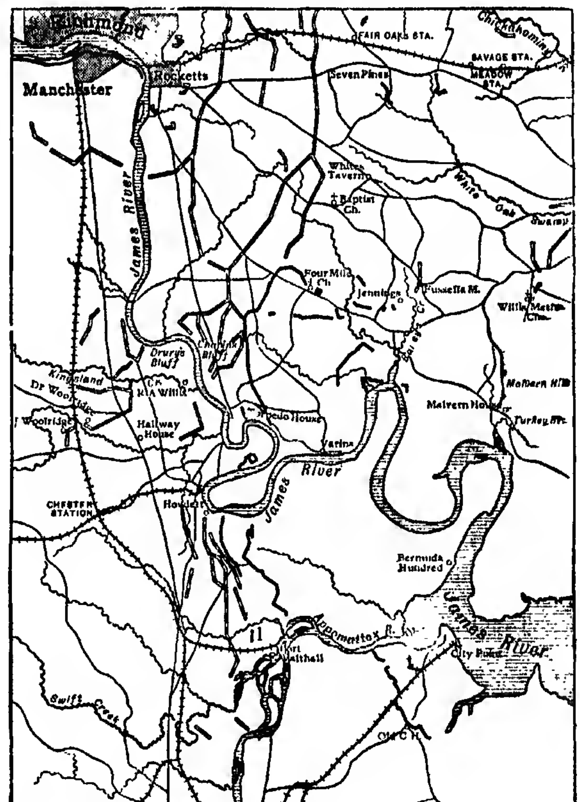
to be destroyed by mining operations. The mine was fired and produced a crater 150 ft. long, 60 ft. wide and 25 ft. deep, into which the Federals poured (see FORTIFICATION and SIEGECRAFT). But the troops could be got no farther before the Confederate counter-attack was upon them, and Burnside's corps lost 4300 men.

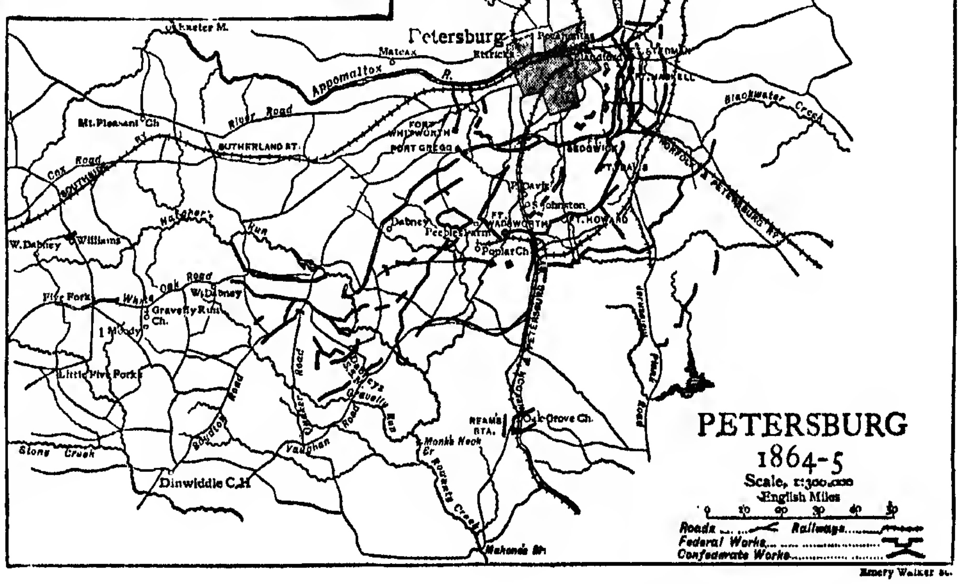
In August Sheridan was detached to operate against General Early in the Shenandoah Valley, and in order to prevent Lee reinforcing Early another demonstration against Richmond was planned. But Lee again strengthened his left and the result of the fighting was a loss to the Federals of nearly 3000 men. Meanwhile another attack on the Weldon railroad by Warren's corps was met by General A. P. Hill on the 20th of August, and the possession of the railroad cost the Federals 3000 men. A further attempt on this railroad by Hancock's II. corps and Gregg's cavalry division at a point 3 m. south of Ream's Station was foiled by A. P. Hill, now aided by Hampton's two cavalry divisions, and the Federals here lost 2372 men and nine guns. The Confederates therefore still retained possession of the railroad to a point within one day's hauling by wagon to Petersburg. During September another Federal enterprise north of the James with two corps (X. and XVIII.) resulted in the capture of Fort Harrison near Chaffin's Bluff, and when General Lee reinforced his left and counter-attacked his troops were repulsed with heavy loss. The Federals lost over 2000 men and failed in the attempt to take Fort Gilmer, Confederate gunboats below Richmond aiding in the defence. While this operation was in progress on the Confederate left under General Grant's personal supervision General Lee was apprised of attacks on his extreme right at Peebles Farm by four divisions, which captured a Confederate redoubt covering the junction of two routes to the south-west. General A. P. Hill prevented a further advance of the enemy by a vigorous counter-attack which caused Warren and Parke (IX.) a loss of 2000 men, of whom nearly three fourths allowed themselves to be captured; for the ranks, since the losses of the May battles, had been swamped with drafted and substitute recruits of poor quality and almost insignificant training. The Federals had, however, by these operations pushed their entrenchments beyond the Weldon railroad westward and established new works within a mile of the Confederate right. A minor engagement north of the James on the 7th of October between the Confederates and troops of the Army of the James was without result. At the end of the month, however, General Grant resolved to make a serious effort to bring the South Side railroad within his lines and deprive the enemy of this important line of supply. Parke (IX.), Warren (V.) and Hancock (II.) took each some 11,000 infantry with four days' rations on pack animals. Gregg's cavalry (3000) were attached for the operation, and both Grant and Meade accompanied the troops. General A. P. Hill encountered this force with three divisions (14,000) and Hampton's cavalry (5500), and he contrived to hold two corps with one division and attack Hancock (II.) with his main body. The Federals were stopped when 6 m. from the railway, and Hancock lost 1500 men at Hatcher's Run on the 27th of October.

General Lee meanwhile had been called to Chaffin's Bluff, where again Butler was demonstrating with the Army of the James (X. and XVIII.) on the approaches to Richmond. But General Longstreet signalized his return to duty with the Army of Northern Virginia by driving Butler off with a loss of over 1000 men (action of Fair Oaks, Oct. 27). General Warren in December contrived to evade A. P. Hill and destroy the Weldon railroad at a point on the Meherrin River 40 m. from Petersburg.

There seemed now little to tie Lee to the lines he had so painfully constructed, for his army was without coffee, tea or sugar, and though of foreign meat they had $3\frac{1}{2}$ million rations and of bread $2\frac{1}{2}$ million rations in reserve, the troops lived chiefly on corn-bread. A. P. Hill on the right held on from Hatcher's Run to Fort Gregg, whence Gordon and Anderson prolonged to the left as far as the Appomattox River, and Longstreet continued the line northwards along the Bermuda front across the James as far as White Oak Swamp (37 m. in all). The winter was very severe, and the continual trench-work and outpost duty overtaxed the patriotism of Lee's 50,000 infantry and stimulated desertion. Supplies were brought in by wagons, as the rolling stock on the railways was worn, and on the 5th of February 1865 General Gregg moved out to the Boydton Plank road to intercept the Confederate convoys. He was supported by Warren, while Humphreys's (II.) corps connected the detachment with the left of the Federal entrenchments. Gregg failed to locate the wagons, and General Lee, hearing of the expedition, sent out A. P. Hill and Gordon, who drove him back with a loss of 1500 men. Sheridan, after driving Early from the Valley in October, destroyed the railways about Staunton, Charlottesville, Gordonsville and Lynchburg, and even rendered the James Canal useless as a line of supply.

Grant recalled Sheridan to the main army in March, and at the end of the month prepared for a turning movement westward with the object of drawing Lee out of his lines. General Lee had anticipated such an attempt, and had resolved to abandon his lines and unite with Johnston in North Carolina, but the roads were not

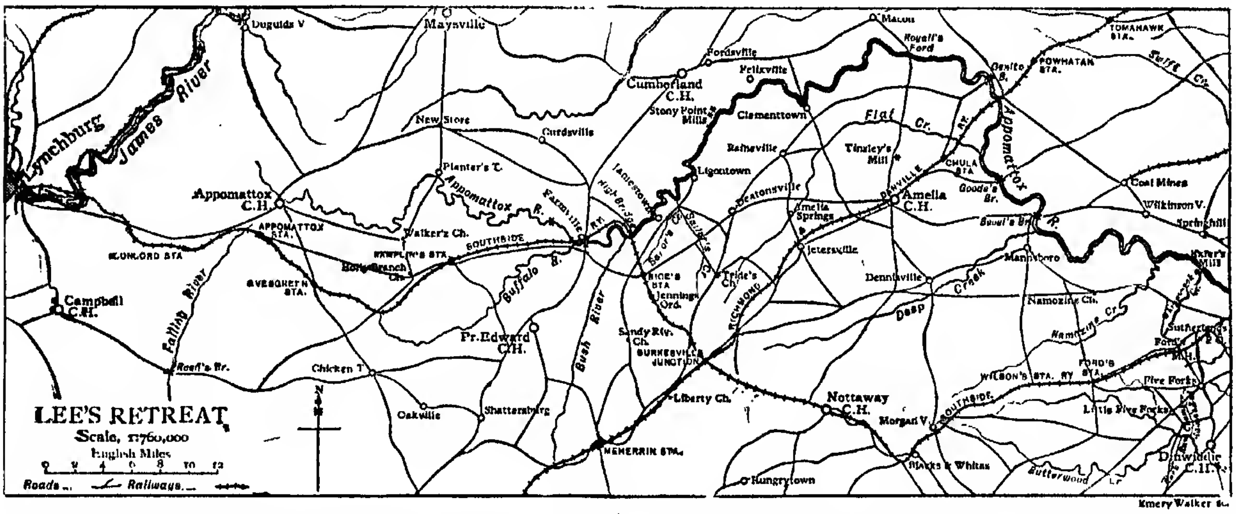




yet in a state for the movement of artillery and wagons, and it was to gain time that he now ventured upon a bold offensive stroke—a night attack upon a strong point in the Federal right called Fort Stedman—the success of which might cause Grant to call in the detachments on his left and so facilitate the proposed movement of the Confederates towards Danville. General Gordon was selected to conduct the operation and his corps was strongly reinforced for the occasion. The opposing lines east of Petersburg were only 150 yds., and the sentries of each side 50 yds. apart. Gordon's men dashed across the intervening space at 4.30 a.m. on the 25th March, surprised the garrison and occupied Fort Stedman, but when daylight broke and the Federal guns could be brought to bear the fort was found to be untenable. Parke's corps (IX.) recaptured the work at a cost of 1000 men, and Gordon fell back, leaving nearly 2000 men in the hands of the Federals. The encounter would have proved a more desperate one it reinforcements on both sides had arrived in time, but Gordon had cut the telegraph which connected Fort Stedman with Grant's headquarters at City Point, and the Confederate train service broke down and delayed the arrival from Richmond of reinforcements for Gordon. Meanwhile, 6 m. westward, Humphreys' corps (II.) attacked A. P. Hill's defences and gained some local success, seizing the Confederate picket line between the Weldon railroad and the Boydton Plank road, which was at once occupied and strengthened by the Federals. The Federals lost 2000 men and the Confederates perhaps twice as many on the 25th of March.

At this time Sherman visited Grant at City Point and proposed to move at the end of ten days on Burkesville Junction and so cut off Lee from Danville and Lynchburg; it was while Sherman was preparing for this operation that Grant finished the campaign. Secure behind his formidable entrenchments, Grant had no fear for his base on the James River, and transferred large bodies of troops to his left without Lee's knowledge. Sheridan was instructed on the 29th of March to gain the enemy's right and rear, moving by Dinwiddie court-house and across Hatcher's Run. But the Confederates were on the alert; A. P. Hill extended his right, and Fitzhugh Lee's cavalry was brought to Sutherland Station. Sheridan had already encountered the cavalry divisions of W. H. F. Lee and Rosser on the south side of Stony Creek. Warren's corps, moving up the Quaker road, met a force under R. H. Anderson and drove it back to its works on White Oak road. Sheridan got into a flat country of dense forest, tangled undergrowth, streams and swamps, and the soil of clay and sand was impassable for wagons and guns until he had corduroyed the route. On the 29th of March General Lee perceived that the object of Grant was to seize the routes south of the Appomattox River, by which a movement south-west could be made to unite with Johnston's army, and he endeavoured to cover these roads, including the South Side railway, without losing his hold upon his works about Richmond and Petersburg, but in such a contest it was evident that numbers must prevail.

Sheridan's cavalry had reached Five Forks on the White Oak road on the 31st of March, and on his right Humphreys and Warren (II. and V.) held the Confederates to their works along Hatcher's Run astride the Boydton Plank road; yet General Lee was able to concentrate his three cavalry divisions, and supported them by Pickett's five infantry brigades. Sheridan was attacked and driven south as far as Dinwiddie court-house; but Humphreys and Warren held their ground (action of White Oak Ridge) at a cost of 2000 men. Pickett and the cavalry fell back to Five Forks during the night and hastily entrenched, for he had been ordered by General Lee to defend this position; since the Boydton Plank road could no longer be held, the possession of White Oak road and the South Side railway became necessary for the flank movement which Lee had resolved to attempt. Grant meanwhile had ordered Warren to support Sheridan in an attack on Pickett at daybreak. Sheridan advanced on the 1st of April and at 3 p.m. issued his orders for attack, explaining verbally a diagram he had prepared for the use of divisional commanders. Pickett held a front of 2 m. with a division of cavalry on either flank and Rosser's cavalry guarding the baggage behind Hatcher's Run, and when attacked at 4 p.m. he was with Rosser 1½ m. in rear. Before Pickett was made aware of a battle being in progress his left was destroyed. General Lee seems to have made no arrangements to support Pickett in this direction. Pickett's right was defended by W. H. F. Lee against the attack of Custer's cavalry division. The position was finally carried by Sheridan's cavalry under Devin dismounting and storming the entrenchments frontally, taking three guns and 100 prisoners. Warren's corps claimed to have captured a battery and 3244 prisoners. Yet Sheridan was dissatisfied with Warren's conduct of the battle and deprived him of his command. Pickett's routed brigades were rallied at the South Side railroad and incorporated with General Anderson's command. But the Confederates had lost White Oak road, and unless General Lee was capable of a vigorous counterstroke on his extreme right it was evident he must also lose the South Side railroad. Grant, fearing such an enterprise, at once reinforced Sheridan and ordered Humphreys' corps (II.) to attack in his front if necessary to prevent Lee moving troops westward, but Lee made no effort, and so Sheridan was free to operate farther in the direction of the enemy's right and rear, while Humphreys held the enemy in his front. Sheridan remained inactive for a few days, and Lee hoped still to gain time for the roads to dry before evacuating his lines and removing his stores and ammunition by wagons towards Lynchburg.



But a crisis was approaching. Sheridan's success at Five Forks induced Grant to deliver a general assault on the 2nd of April. The Confederate lines were bombarded all night, and on the 2nd of April with Wright's corps (VI.), Grant attacked the weakest part of Lee's line and broke through, losing 1100 men in fifteen minutes. A. P. Hill was killed and his corps broke and was cut off from Petersburg. At the same time Parke's corps (IX.), on the right of the VI., attacked the eastern front near Fort Stedman but was repulsed by General Gordon; then Humphreys' corps (II.) on the left attacked a Confederate division under General Cook and forced it to retreat to the South Side railroad, where at Sutherland Station a final attack dispersed it. Wright, supported by General Ord (commanding the army of the James), afterwards won the strong redoubts called Fort Whitworth and Fort Gregg, and thus in a day the Confederate right had been destroyed from Five Forks to a point some two or three miles west of the Weldon railroad; 10 m. of works had been abandoned, and if Grant had been able to press his advantage at once the campaign must have ended. But Grant was not aware of the enemy's plight, and so resolved to wait until the morrow before completing his victory.

Meanwhile Lee perceived that the hour had come at last when Richmond must fall, and at 3 p.m. he had issued orders for the march of the remains of his army to Lynchburg via Amelia court-house, a march which evidently must partake of the character of a forlorn hope, hastily planned, ill prepared and undertaken by troops whom the disasters and hardships of the past six months had weakened physically and morally. Yet if General Lee had negotiated a peace on the 2nd of April military history would have lost one of the finest examples of the strategic pursuit. Lee's proposed movement involved the transfer of the army and its baggage 100 m. on bad roads across the front of an enemy, and nothing but mischance could prevent the Federals intercepting Lee's columns by a shorter route and seizing the South Side railroad, on which supplies

were to be forwarded from Lynchburg to meet the retreating army at Appomattox Station, Pamplin's Station or Farmville Station. The Appomattox River must be crossed two or three times at its bends. Various creeks and swamps must be bridged, and the bridges destroyed after crossing. The wagons must move on separate roads so as to be covered by the columns during marches and combats and the infantry were to follow the artillery on the roads. Longstreet, Gordon and Mahone's division from Richmond all crossed the Appomattox at Goode's Bridge. Ewell from Richmond crossed the Appomattox by the Danville railroad bridge north of Goode's Bridge. Anderson commanded the flank guard which moved south of the Appomattox with Fitzhugh Lee's cavalry. Lee gained a day's start by moving at 8 p.m., for Grant was making preparations to attack the entrenchments next day (April 3), but the start was lost in waiting for President Davis and the government to escape from Richmond. Sheridan's cavalry got in touch with Lee's flank-guard early on the 3rd of April near Namozine Creek, and at nightfall the Federal advance-guard was at Deep Creek. On the 4th of April Sheridan reached the Danville railroad at Jetersville, and on the 5th of April, when Lee had halted at Amelia court house on the railroad to get supplies, the Federals had three corps (II., V., VI.) in support of Sheridan 8 m. nearer than Lee to Sailor's Creek, the point where he must again cross the Appomattox.

Interception was now a *fait accompli*, though neither side suspected it. Lee was unaware of the enemy's proximity, and Grant believed that Lee would remain at Amelia court-house, but Lee moved west, crossing Flat Creek at sunset on the 5th of April, to the Lynchburg railroad (Longstreet, marching all night, reached Rice's Station at sunrise on the 6th of April), while the Federals moved northwards on the same day to attack Lee at Amelia court-house, and on discovering Lee's evasion the three Federal corps effected a wheel to the left and advanced on Deatonsville after bridging Flat Creek. Meanwhile the Federal cavalry under H. E. Davies had located a convoy at Painesville, dispersed its escort (Gary's cavalry) and burned the wagons, but had in turn been attacked by Fitzhugh Lee's cavalry at Amelia Springs and driven back on the main body at Flat Creek. Fitzhugh Lee had then marched to join Longstreet at Rice's Station. The rearguard of Lee's army was Gordon's command, which was at Amelia Springs after Ewell's command had passed through at 8 a.m. on the 6th of April. Lee's army stretched out for 15 m., and when its advance-guard was at Rice's Station its rearguard was still at Ameba court-house. Rice's Station is 62 m. from Lynchburg. Here Longstreet waited all day for Anderson, Ewell and Gordon to close up, and then at night he moved 8 m. to Farmville Station (68 m. south-west of Richmond), where 80,000 rations had been railed from Lynchburg; then Longstreet crossed the Appomattox, and on the 7th of April moved forward towards Lynchburg, covered by Fitzbugh Lee's cavalry. Meanwhile the remainder of Lee's army had been practically destroyed within a few miles of the point where Longstreet had halted. Sheridan's cavalry and two corps (II., VI.) had caught the commands of Anderson, Ewell and Gordon, entangled with the trains of the army attempting the passage of Sailor's Creek; and General Ord would even have attacked Longstreet (whom he had located late at night) had his march been delayed.

Complete disorganization and demoralization seem to have taken hold of the Confederates on this fatal day, and General Lee was once more in eclipse. The Federal cavalry headed the column, the infantry attacked it, and Ewell became the victim of tactical envelopment after Anderson had been defeated and Gordon had failed to save the trains of the army. Surrender or massacre being the alternatives, Ewell surrendered, and here in fact the career of the army of Northern Virginia ended, as Grant plainly saw, for at 5.30 p.m. he addressed a demand to Lee for his capitulation. But Lee clung to his diminished forces for another 48 hours. Longstreet in crossing at Farmville had burnt the bridges and thus delayed Ord in pursuit; but Gordon and Mahone, who had crossed at High Bridge (the railroad bridge), failed to check Humphreys' corps (II.), and so were compelled to take up a position of defence on the north bank until darkness enabled them to slip away. General Lee was with this remnant of the army. Meanwhile Sheridan with the cavalry and two corps (V., XXIV.) had hastened along the South Side railroad, seizing the supplies waiting for Lee at Pamplin's Station, and then moving on another 12 m. to Appomattox Station. At nightfall he found that he was astride the enemy's line of operation, which was also his line of supply, and so General Lee would be compelled to give battle or capitulate on the morrow.

General Lee, quitting Farmville heights on the night of the 7th of April changed the order of march during the next day, so that Gordon (8000) was in the van and Longstreet (15,000) furnished the rearguard. Ewell's corps was now represented by 300 effectives. The cavalry still numbered some 1000 sabres. Lee's column was pursued along the Lynchburg Road by two Federal Corps (II., VI.), which marched 26 m. in 18½ hours, and at midnight halted within 3 m. of Longstreet, who had entrenched near Appomattox court-house, facing east and covering the road on which Gordon's corps and the cavalry was to press forward to Lynchburg at daylight. But Gordon on the morning of the 9th of April found Sheridan's cavalry in his front, and in accordance with plans made overnight he commenced an attack, driving the Federals back until he encountered at 10 a.m. two corps of infantry (V., XXIV.) under General Ord, who had marched 29 m. in order to support Sheridan at the crisis; and when at the same moment Longstreet was threatened by Humphreys and Wright (II., VI.) the situation had arisen which General Lee considered would justify surrender, an event which had been anticipated on both sides as the result of the fighting about Farmville on the 6th and 7th of April.

The closing operations from the 29th of March to the 9th of April were all in favour of the Federals, but, nevertheless, the historian counts their losses during this period as nearly 10,000 in the five corps and cavalry which constituted General Grant's field army. On the 9th of April, at the Appomattox court-house, the two leaders exchanged formal documents by which 2862 officers and 25,494 enlisted men were paroled, all that remained in the field of some 55,000 Confederates who were drawing rations on the 20th of February as the army of Northern Virginia. (G. W. R.)

PETERSFIELD, a market town in the Petersfield parliamentary division of Hampshire, England, 55 m. S.W. from London by the London & South Western railway. Pop. of urban district (1901), 3265. The church of St Peter retains some ornate Norman work. The picturesque market-place contains an equestrian statue of William III.

Ecclesiastically a chapelry of Buriton, Petersfield (Peterfelde) owes its origin as a borough to the charter granted by William, earl of Gloucester, in the reign of Henry II. and confirmed later by his widow, Hawise. Petersfield is not mentioned in Domesday, but it was probably then included in the manor of Mapledurham. It was a mesne borough possessing by its first charter the liberties and customs of Winchester together with a merchant gild. These grants were confirmed by John in 1198 and in 1415 Henry V. in addition freed the burgesses from all tolls. No charter of incorporation has been found. Gradually privileges and rights other than those of a mesne borough were usurped by the mayor and burgesses, but were recovered by a suit brought against them by Thomas Hanbury, owner of the borough, in 1611. A mayor continued to be elected until 1885. Petersfield was represented in parliament in 1307. No return was then made until 1552–1553, from which date two members were regularly returned. In 1832 the number was reduced to one, and in 1885 the representation was merged in that of the county. Three-day fairs at the feasts of St Peter and St Andrew were granted in 1255. In 1892 the summer fair then held on the 10th of July was abolished. The autumn fair now held on the 6th of October is for both business and pleasure. The market, which dates from before 1373, formerly held on Saturday, is now held on alternate Wednesdays. In the 16th century Petersfield had important cloth and leather manufactures.

PETER'S PENCE, Rome Scot, or Rom-feoh, a tax of a penny on every hearth, formerly paid annually to the popes; now represented by a voluntary contribution made by the devout in Roman Catholic churches. Its date of origin is doubtful. The first written evidence of it is contained in a letter of Canute (1031) sent from Rome to the English clergy. At this time it appears to have been levied on all families possessed of land worth thirty pence yearly rental, out of which they paid one penny. Matthew Paris says the tax was instituted by Offa, king of Mercia (757–796), for the upkeep of the English school and hostel at Rome. Layamon, however, declares that Ina, king of Wessex (688–725), was the originator of the idea. At the Norman Conquest it appears to have fallen into arrears for a time, for William the Conqueror promised the pope in 1076 that it should be regularly paid. By a bull of Pope Adrian IV. the tax was extended to Ireland. In 1213 Innocent III. complained that the bishops kept 1000 marks of it, only forwarding 300 to Rome. In 1306 Clement V. exacted a penny from each household instead of the £201, 9s. at which the tax appears to have been then fixed. The threat of withholding Peter's pence proved more than once a useful weapon against recalcitrant popes in the hands of English kings. Thus in 1366 and for some years after it was refused on the ground of the pope's obstinacy in withholding his consent to the statute of praemunire. During the 10th century the custom of Peter's pence was introduced into Poland, Prussia and Scandinavia, and in the 11th century Gregory VII. attempted to exact it from France and

Spain. The tax was fairly regularly paid by the English until 1534, when it was abolished by Henry VIII.

PETERWARDEIN (Hung. *Petervarad*, Serv. *Petrovaradin*), a royal free town and fortress of Hungary in the county of Syrmia, Croatia-Slavonia; situated on a promontory formed by a loop of the Danube, 62 m. N.W. of Belgrade by rail. Pop. (1900), 5019. It is connected with Neusatz on the opposite bank by a bridge of boats, a railway bridge and a steam ferry. The fortifications consist of the upper fortress, on a lofty serpentine rock rising abruptly from the plain on three sides, and of the lower fortress at the northern base of the rock. The two fortresses can accommodate a garrison of 10,000 men. In the lower fortress is the town, with a military hospital, and an arsenal containing trophies captured from the Turks. Peterwardein, the "Gibraltar of Hungary," is believed to represent the Roman *Acumincum*, and received its present name from Peter the Hermit, who here in 1096 marshalled the levies of the first crusade. It was captured by the Turks in 1526 and retained by them for 160 years. In 1716 it witnessed a signal defeat inflicted on the Turks by Prince Eugène. During the revolutionary struggles of 1848–49 the fortress was held by the insurgents for a short time.

PETHERICK, JOHN (1813–1882), Welsh traveller in East Central Africa, was born in Glamorganshire, and adopted the profession of mining engineer. In 1845 he entered the service of Mehemet Ali, and was employed in examining Upper Egypt, Nubia, the Red Sea coast and Kordofan in an unsuccessful search for coal. In 1848 Petherick left the Egyptian service and established himself at El Obeid, the capital of Kordofan, as a trader, dealing largely in gum arabic. He was at the same time made British consular agent for the Sudan. In 1853 he removed to Khartum and became an ivory trader. He travelled extensively in the Bahr-el-Ghazal region, then almost unknown, exploring the Jur, Yalo and other affluents of the Ghazal. In 1858 he penetrated to the Niam-Niam country. His additions to the knowledge of natural history were considerable, among his discoveries being the *Cobus maria* (Mrs Gray's waterbuck) and the *Balaeniceps rex* (white-headed stork). Petherick returned to England in 1859 where he made the acquaintance of J. H. Speke, then arranging for his expedition to discover the source of the Nile. While in England Petherick married, and published an account of his travels. He returned to the Sudan in 1861, accompanied by his wife and with the rank of consul. He was entrusted with a mission by the Royal Geographical Society to convey to Gondokoro relief stores for Captains Speke and Grant. Petherick got boats to Gondokoro in 1862, but Speke and Grant had not arrived. Having arranged for a native force to proceed south to get in touch with the absentees, a task successfully accomplished, Mr and Mrs Petherick undertook another journey in the Bahr-el-Ghazal, making important collections of plants and fishes. They regained Gondokoro (where one of their boats with stores was already stationed) in February 1863, four days after the arrival of Speke and Grant, who had meantime accepted the hospitality of Mr (afterwards Sir) Samuel Baker. The charge that Petherick failed to meet his engagement to those travellers is unsubstantiated. A further charge that Petherick had countenanced and even taken part in the slave trade was subsequently shown to have no foundation (Petherick in fact had endeavoured to stop the traffic), but it led Earl Russell, then secretary for foreign affairs, to abolish the British consulate at Khartum (1864). In 1865 the Pethericks returned to England, and in 1869 published *Travels in Central Africa and Explorations of the Western Nile Tributaries*, in which book are set out the details of the Speke controversy. Petherick died in London, on the 15th of July 1882.

PÉTION DE VILLENEUVE, JERÔME (1756–1794), French writer and politician, was the son of a *procureur* at Chartres. He became an avocat in 1778, and at once began to try to make a name in literature. His first printed work was an essay, *Sur les moyens de prévenir l'infanticide*, which failed to gain the prize for which it was composed, but pleased Brissot so much that he printed it in vol. vii. of his *Bibliothèque philosophique des legislateurs*. Pétion's next works, *Les Lois civiles*, and *Essai sur le mariage*, in which he advocated the marriage of priests, confirmed his position as a bold reformer, and when the elections to the States-General took place in 1789 he was elected a deputy to the Tiers État for Chartres. Both in the assembly of the Tiers État and in the Constituent Assembly Pétion showed himself a radical leader. He supported Mirabeau on the 23rd of June, attacked the queen on the 5th of October, and was elected president on the 4th of December 1790. On the 15th of June 1791 he was elected president of the criminal tribunal of Paris. On the 21st of June 1791 he was chosen one of three commissioners appointed to bring back the king from Varennes, and he has left a fatuous account of the journey. After the last meeting of the assembly on the 30th of September 1791 Robespierre and Pétion were made the popular heroes and were crowned by the populace with civic crowns. Pétion received a still further proof of the affection of the Parisians for himself on the 16th of November 1791, when he was elected second mayor of Paris in succession to Bailly. In his mayoralty he exhibited clearly his republican tendency and his hatred of the old monarchy, especially on the 20th of June 1792, when he allowed the mob to overrun the Tuileries and insult the royal family. For neglecting to protect the Tuileries he was suspended from his functions by the Directory of the department of the Seine, but the leaders of the Legislative Assembly felt that Pétion's cause was theirs, and rescinded the suspension on the 13th of July. On the 3rd of August, at the head of the municipality of Paris, Pétion demanded the dethronement of the king. He was elected to the Convention for Eure-et-Loir and became its first president. L. P. Manuel had the folly to propose that the president of the Assembly should have the same authority as the president of the United States; his proposition was at once rejected, but Pétion got the nickname of "Roi Pétion," which contributed to his fall. His jealousy of Robespierre allied him to the Girondin party, with which he voted for the king's death and for the appeal to the people. He was elected in March 1793 to the first Committee of Public Safety; and he attacked Robespierre, who had accused him of having known and having kept secret Dumouriez's project of treason. His popularity however had waned, and his name was among those of the twenty-two Girondin deputies proscribed on the 2nd of June. Pétion was one of those who escaped to Caen and raised the standard of provincial insurrection against the Convention; and, when the Norman rising failed, he fled with M. E. Guadet, F. A. Buzot, C. J. M. Barbaroux, J. B. Salle and Louvet de Couvrai to the Gironde, where they were sheltered by a wigmaker of Saint Émilion. At last, a month before Robespierre's fall in June 1794, the escaped deputies felt themselves no longer safe, and deserted their asylum; Louvet found his way to Paris, Salle and Guadet to Bordeaux, where they were soon taken; Barbaroux committed suicide; and the bodies of Pétion and Buzot, who also killed themselves, were found in a field, half-eaten by wolves.

See *Mémoires inédits de Pétion et mémoires de Buzot et de Barbaroux, accompagnés de notes inédites de Buzot et de nombreux documents inédits sur Barbaroux, Buzot, Brissot, &c., précédés d'une introduction par C. A. Dauban* (Paris, 1866); *Œuvres de Pétion* (3 vols., 1792); F. A. Aulard, *Les Orateurs de la Constituante* (Paris, 1882).

PÉTIS DE LA CROIX, FRANÇOIS (1653–1713), French orientalist, was born in Paris in 1653. He was son of the Arabic interpreter of the French court, and inherited this office at his father's death in 1695, afterwards transmitting it to his own son, Alexandre Louis Marie, who also distinguished himself in Oriental studies. At an early age he was sent by Colbert to the East; during the ten years he spent in Syria, Persia and Turkey he mastered Arabic, Persian and Turkish, and also collected rich materials for future writings. He served a short time as secretary to the French ambassador in Morocco, and accompanied as interpreter the French forces sent against Algiers, contributing to the satisfactory settlement of the treaty of peace, which was drawn up by himself in Turkish and ratified in 1684. He conducted the negotiations with Tunis and Tripoli

in 1685, and those with Morocco in 1687; and the zeal, tact and linguistic knowledge he manifested in these and other transactions with Eastern courts were at last rewarded in 1692 by his appointment to the Arabic chair in the Collège Royal de France, which he filled until his death in 1713.

He published *Contes turcs* (Paris, 1707), and *Les Mille et un jours* (5 vols., Paris, 1710 1712); an *Armenian Dictionary* and an *Account of Ethiopia*. But the lasting monument of his literary fame is his excellent French version of Sharaf-uddīn 'Alī Yazdi's *Zafarnāma* or *History of Tīmūr* (completed 828 A.H.: A.D. 1425), which was given to the world nine years after his death (4 vols., Paris, 1722; Eng. trans. by J. Darby, London, 1723). This work, one of the rare specimens of a fairly critical history Persia can boast of, was compiled under the auspices of Mirzā Ibrāhīm Sultān, the son of Shāh Rukh and grandson of the great Tīmūr. The only error committed by Pétis de la Croix in his otherwise very correct translation is that he erroneously ascribed the important share which Ibrāhīm Sultān had in the *Zafarnāma* to Tīmūr himself.

PETIT, SIR DINSHAW MANECKJI, Bart. (1823–1901), Parsee philanthropist, was born on the 30th of June 1823. As broker to European firms he amassed a large fortune during the period of speculation in Bombay at the time of the American Civil War. In 1886 he became a member of the governor-general's legislative council. He devoted his wealth to philanthropic objects, among the public and private charities which he endowed being the Towers of Silence and fire temples of the Parsees, a hospital for animals, a college for women, and the Petit hospital. He was knighted in 1887, created a baronet in 1890, and died in February 1901.

PETIT DE JULLEVILLE, LOUIS (1841-1900), French scholar, was born in Paris on the 18th of July 1841. Educated at the École Normale Supérieure, and at the French school at Athens, he received his doctorate in literature in 1868. After holding various posts as a teacher he became professor of French medieval literature and of the history of the French language in the university of Paris in 1886. He died on the 28th of August 1900.

His most important works are: *Histoire du théâtre en France*, including *Les Mystères* (2 vols., 1880); *Les Comédiens en France au moyen âge* (1885); *La Comédie et les mœurs en France au moyen âge* (1886); *Répertoire du théâtre comique en France au moyen âge* (1886); and *Le Théâtre en France, histoire de la littérature dramatique depuis ses origines jusqu'à nos jours* (1889). Petit de Julleville was also the general editor of the *Histoire de la langue et de la littérature française* (8 vols., 1896-1900), to which he himself contributed some valuable chapters.

PETITION (Lat. for "seeking" or "praying"), a term meaning generally a prayerful request, and in its more important constitutional aspect an application for redress by a person aggrieved to an authority capable of relieving him. It may be made in the United Kingdom to the Crown or its officers, or to either house of parliament, or in certain cases to courts of justice.

Petitions to the Crown.—The right of petitioning the Crown was recognized indirectly as early as Magna Carta in the famous clause, *Nulli vendemus, nulli negabimus aut differemus, rectum vel justitiam* (25 Edw. I. c. 29), and directly at various periods later, *e.g.* in the articles of the Commons assented to by Henry IV., by which the king was to assign two days in the week for petitions (*Rot. Parl.* 8 Hen. IV., p. 585). The case of the seven bishops in 1688 confirmed the right, and finally the Bill of Rights in 1689 declared "that it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal." Petitions to the Crown appear to have been at first for the redress of private and local grievances, or for remedies which the courts of law could not grant (May, *Parl. Pr.*, 11th ed., 522). As equity grew into a system, petitions of this kind not seeking legislative remedies tended to become superseded by bills in chancery. Statutes were originally drawn up by the judges at the close of the session of parliament from the petitions of the Commons and the answers of the Crown. Under this system of drafting it was found that the tenor of the petition and answer were not always stated correctly. To obviate this inconvenience demands for legislation came in the reign of Henry VI. to be drawn up in the form of bills which the Crown could accept or reject, but could not alter (see Anson, *Law and Custom of the Constitution*, 3rd ed., vol. i. p. 241). In the same reign the words "by authority of parliament" were added to the words of enactment, and from the time of Henry VII. public legislation has been by bill and not by petition. A relic of the old form of statute founded upon petition still remains however in the preamble of Appropriation Acts and other statutes creating a charge upon the public revenue. It runs thus: "We, your majesty's most dutiful and loyal subjects, the Commons of the United Kingdom . . . do most humbly beseech your majesty that it may be enacted; and be it enacted," &c., from this point following the enacting words common to all statutes. The Crown may refer petitions presented to it to be adjudicated upon by a delegated authority. This course is pursued in the case of claims to peerages and offices of honour, which are referred to the House of Lords, and by that house to its committee for privileges, and in the case of petitions to the Crown in council, which are usually referred to the judicial committee. The Crown may delegate the power of receiving petitions in the first instance.

Petitions to Parliament.—Petitions to either house of the legislature seem to have been later in origin than petitions to the Crown. They are not referred to in the Bill of Rights, but the right of petition is a convention of the constitution. Petitions to the Lords or the whole parliament can be traced back to Henry III. No petition to the Commons has been found earlier than Richard II.; but from the time of Henry IV. petitions to the Commons have been freely made. The political importance of petitioning dates from about the reign of Charles I. The development of the practice of petitioning had proceeded so far in the reign of Charles II. as to lead to the passing in 1662 of an act (13 Car. II. c. 5) against "tumultuous petitioning," which is still on the statute book. It provides that no petition or address shall be presented to the king or either house of parliament by more than ten persons; nor shall any one procure above twenty persons to consent or set their hands to any petition for alteration of matters established by law in church or state, unless with the previous order of three justices of the county, or the major part of the grand jury. And in 1817 (57 Geo. III. c. 19, s. 23) meetings within a mile from Westminster Hall for the purpose of considering a petition to both houses or either house of parliament while either house is sitting were declared to be unlawful assemblies. Up to 1688 petitions to either house usually dealt only with some specific grievance. From that time dates the present practice of petitioning with regard to general measures of public policy. Petitions to the Houses of Lords or Commons must be framed in the form prescribed by the standing orders, must be properly superscribed, and must conclude with a prayer (May, *Parl. Pr.*, 11th ed., 524, 525). They may be sent free by post to members of either house if they fulfil certain conditions as to weight, &c. (*loc. cit.* p. 531).

Petitions to the Commons must be in writing, must contain none but genuine signatures, and must be free from disrespectful language or imputations upon any tribunal or constituted authority. They must be presented by a member of the house, except petitions to the House of Commons from the corporation of London, which may be presented at the bar by the sheriffs, and from the corporation of Dublin, which may be presented by the lord mayor. There is no means of compelling a member to present a petition. The rules as to petitions to the House of Lords are similar. The lord who presents a petition is required to read it to see whether in form and contents it is fit for presentation. In the Lords receivers and triers of petitions from Great Britain and Ireland and from Gascony and the lands and countries beyond the sea were appointed until 1886, though their functions had long been obsolete. Applications for leave to bring before either house bills for private or local and personal matters must under the standing orders of both houses be made by petition; and the same rule obtains as to applications for leave to be heard in opposition to such bills.

See Clifford, *History of Private Bill Legislation* (1887); May, *Parl. Pr.* (11th ed.), c. xxv.

Petitions to Courts of Justice.—Strictly speaking, these are an indirect mode of petitioning the Crown, for in the theory of English law the Crown is the fountain of justice. But it is more convenient to treat them separately, as they now form a part of the practice of the courts. Appeals to the House of Lords and the privy council are prosecuted by petition of appeal. The

original jurisdiction of the privy council to deal with petitions is confined to proceedings under certain statutes, such as the Endowed Schools Acts, the Public Schools Acts, the Universities Acts and the Patents Acts. In most cases the petitions are referred to the judicial committee of the council. Petitions may be addressed to the lord chancellor in a few instances, *e.g.* for the removal of coroners or county court judges. The House of Lords at one time claimed original jurisdiction in civil and criminal matters. As to civil matters the claim is abandoned; as to criminal matters it is now limited to impeachment for crime by the Commons on the trial for treason or felony of persons having privilege of peerage.

The most important use of petitions in England is in the High Court of Justice. In the chancery division petitions are presented either as interlocutory proceedings in the course of an action, or as original proceedings where no litigation exists—as being a more speedy form of remedy than an action. The cases in which a petition is admissible and the procedure therein, are in the main regulated by orders 52 and 55 of the rules of the supreme court. Evidence in support of petitions is usually by affidavit. Petitions in the course of an action are presented to the court in which the action is brought. Examples of original petitions are those under the Lands Clauses Acts, the Trustee Acts and the Companies Acts. For many proceedings under these acts a simpler and cheaper form of proceeding by summons has been substituted for that by petition. The matters above-mentioned are usually dealt with by the chancery division as successor of the court of chancery. Petitions are also in use in other courts having equitable jurisdiction, *e.g.* the chancery courts of the counties palatine of Lancaster and Durham and the county courts as to cases falling within § 67 of the County Courts Act 1888, and as to cases within county court jurisdiction under the Settled Land Acts or the Guardianship of Infants Act 1886 (County Court Rules, O. 38). In a few cases petitions may be brought by way of appeal, *e.g.* under the Charitable Trusts Act 1860. In the king's bench division the only use of petitions appears to be to initiate proceedings in bankruptcy. Leave to sue *in formâ pauperis* used to be given on petition but is now usually dealt with summarily. In the probate, &c., division proceedings in matrimonial causes, &c., are begun by petition, but the course of the proceedings closely resembles those of an ordinary action.

Scotland.—In Scotland petitions in the Court of Session are either original or in a pending action. Original petitions are presented to one of the divisions of the inner house, unless they relate to matters mentioned in 20 & 21 Vict. c. 56, s. 4, when they are brought before the junior lord ordinary, or unless, by special statutory provision, they may be brought before any lord ordinary, as in the case of petitions under the "Conjugal Rights (Scotland) Amendment Act 1861," or the Trusts (Scotland) Act 1867. A *petition and complaint* is a process of a quasi-criminal nature by which certain matters of summary and extraordinary jurisdiction are brought under the notice of the Court of Session. It lies against magistrates and officers of the law for breach of duty, against parties guilty of contempt of court, &c. The concurrence of the lord advocate is necessary to a petition and complaint (see Mackay, *Court of Session Practice*, ii. 439).

Ireland.—The law of Ireland as to petitions is in substance the same as that of England with certain differences of detail as to the cases in which petitions may be made to courts of justice.

United States.—In the United States before the Civil War questions arose as to the right of petitioning Congress, particularly with reference to petitions for the restriction of slavery which at that time was contended to be a matter of state and not of federal concern (see Cooley, *Constitutional Limitations*, 6th ed., 1890, 426). The right of petitioning the United States government is now secured by the first amendment to the United States constitution (ratified in 1789-1791), which provides that "Congress shall make no law . . . abridging . . . the right of the people peaceably to assemble and to petition the government for a redress of grievances." In the view of the Supreme Court this amendment "assumes the existence of the right of the people to assemble for lawful purposes and protects it against encroachment by Congress. The right was not created by the amendment; neither was its continuance guaranteed except as against congressional interference. For their protection in its enjoyment, therefore, the people must look to the states. The power for that purpose was originally placed there, and has never been surrendered. The right of the people peaceably to assemble for the purpose of petitioning Congress for a redress of grievances, or for anything else connected with the powers or duties of the national government is an attribute of national citizenship, and as such under the protection of and guaranteed by the United States. The very idea of a government republican in form implies a right on the part of its citizens to meet peaceably for consultation in respect to public affairs and to petition for a redress of grievances" (*U.S.* v. *Cruikshank*, 1875; 92 U.S. 542, 552).

The English Bill of Rights is incorporated in the constitutions of many states of the Union and made part of the supreme law of the states (see Hough, *American Constitutions*, ii. 571). Petitions can be presented to the federal or state courts of justice under much the same circumstances as in England. "It is a general rule in such cases that an affidavit should be made that the facts therein contained are true as far as known to the petitioner, and that those facts which he states as knowing from others he believes to be true" (Bouvier, *Law Dict.*).

British Possessions.—There is a right of petition to the king for the review of decisions (in matters criminal or civil) of courts of justice in the Channel Islands or Isle of Man, and in all other parts of the empire outside the British islands and of British courts in foreign countries. This right is cut down by imperial or colonial legislation in the case of Canada and Australia, see Tarring, *Law Relating to Colonies* (3rd ed., 1906), c. v.

The term *Petition of Right*, in English law, is used in two senses. (1) It denotes the statute of 1625 (3 Car. I. c. 1), a parliamentary declaration of the liberties of the people. (2) It also and more usually is employed to describe a mode of prosecuting a claim by a subject against the Crown, said to owe its origin to Edward I. Petition of right in this sense lies (*a*) to obtain restitution of real or personal property of the subject which has found its way into the hands of the Crown, or compensation if restitution cannot be made; (*b*) to recover damages for breach of a contract made on behalf of the Crown, whether the breach is due to the acts or the omissions of servants of the Crown. Where the Crown is in possession of property of the suppliant, and the title of the Crown appears by record, as by inquest of office, the remedy is somewhat different and is called *monstrans de droit*. Petition of right does not lie in respect of engagements in the naval, military or civil service of the Crown, which are as a general rule made "during pleasure," nor for breach of public duty, *e.g.* failure to perform treaty obligations, nor for trespass or negligence or other torts by Crown servants. Where such acts are wrongful the remedy is by action against the official as an individual and not in his official capacity (*Raleigh* v. *Goschen*, 1898, L.R. 1 ch. 73).

The procedure on a petition of right is either at common law or by statute. At common law the petition went through its earliest stages in the chancery. It suggests such a right as controverts the title of the Crown, and the Crown endorses upon the petition *Soit droit fait al partie*. Thereupon a commission is issued to inquire into the truth of the suggestion. After the return to the commission, the attorney-general pleads or demurs, and the merits are then determined as in actions between subject and subject. If the right be determined against the Crown, judgment of *amoveas manus* is given in favour of the suppliant. The Petition of Right Act 1860 (23 & 24 Vict. c. 34, extended to Ireland in 1873, 36 & 37 Vict. c. 69) preserves to the suppliant his right to proceed at common law, but gives an alternative remedy. The procedure is regulated by the act of 1860, and as to England also by rules made under that act on the 1st of February 1862. The petition is left with the secretary of state for the home department for the consideration of his majesty, who if he thinks fit grants his *fiat* that right be done. The *fiat* is sealed in the home office and issued to the suppliant who files it in the central office of the High Court of Justice, and a sealed copy is served upon the solicitor to the treasury, with a demand for a plea or answer on behalf of the Crown. The subsequent proceedings including those as to disclosing relevant documents are assimilated as far as possible to those in an ordinary action. A judgment in favour of the suppliant is equivalent to a judgment of *amoveas manus ouster le main*. Costs are payable to and by the Crown. A petition of right is usually tried in the chancery or king's bench divisions; but where the subject-matter of the petition arises out of the exercise of belligerent rights on behalf of the Crown, or would be cognizable in a prize court if the matter were in dispute between private persons, the suppliant may at his option intitule his petition in the admiralty division, and the lord chancellor may direct the prosecution in that division of petitions of right under the act of 1860 even when they are not so intituled (27 & 28 Vict. c. 25, s. 52).

The law as to petition of right applies to Ireland but not to Scotland, and a right to present such a petition appears to exist in colonies whose law is based on the common law of England. But in many colonies legislation has been passed with respect to suits against government which makes it unnecessary to resort to a petition of right.

PETITIO PRINCIPII, or Begging the Question (Gr. τὸ ἐν ἀρχῇ λαμβάνειν, τὸ ἐξ ἀρχῆς αἰτεῖσθαι), in logic, the fourth of Aristotle's fallacies ἔξω τῆς λέξεως or *extra dictionem*. Strictly this fallacy belongs to the language of disputation, when the questioner seeks (*petit*) to get his adversary to admit the very matter in question. Hence the word *principium* gives a wrong impression, for the fallacy consists not in seeking for the

in 1685, and those with Morocco in 1687; and the zeal, tact and linguistic knowledge he manifested in these and other transactions with Eastern courts were at last rewarded in 1692 by his appointment to the Arabic chair in the Collège Royal de France, which he filled until his death in 1713.

He published *Contes turcs* (Paris, 1707), and *Les Mille et un jours* (5 vols., Paris, 1710 1712); an *Armenian Dictionary* and an *Account of Ethiopia*. But the lasting monument of his literary fame is his excellent French version of Sharaf-uddīn 'Alī Yazdi's *Zafarnāma* or *History of Tīmūr* (completed 828 A.H.: A.D. 1425), which was given to the world nine years after his death (4 vols., Paris, 1722; Eng. trans. by J. Darby, London, 1723). This work, one of the rare specimens of a fairly critical history Persia can boast of, was compiled under the auspices of Mīrzā Ibrāhīm Sultān, the son of Shāh Rukh and grandson of the great Tīmūr. The only error committed by Pétis de la Croix in his otherwise very correct translation is that he erroneously ascribed the important share which Ibrāhīm Sultān had in the *Zafarnāma* to Tīmūr himself.

PETIT, SIR DINSHAW MANECKJI, BART. (1823–1901), Parsee philanthropist, was born on the 30th of June 1823. As broker to European firms he amassed a large fortune during the period of speculation in Bombay at the time of the American Civil War. In 1886 he became a member of the governor-general's legislative council. He devoted his wealth to philanthropic objects, among the public and private charities which he endowed being the Towers of Silence and fire temples of the Parsees, a hospital for animals, a college for women, and the Petit hospital. He was knighted in 1887, created a baronet in 1890, and died in February 1901.

PETIT DE JULLEVILLE, LOUIS (1841–1900), French scholar, was born in Paris on the 18th of July 1841. Educated at the École Normale Supérieure, and at the French school at Athens, he received his doctorate in literature in 1868. After holding various posts as a teacher he became professor of French medieval literature and of the history of the French language in the university of Paris in 1886. He died on the 28th of August 1900.

His most important works are: *Histoire du théâtre en France*, including *Les Mystères* (2 vols., 1880); *Les Comédiens en France au moyen âge* (1885); *La Comédie et les mœurs en France au moyen âge* (1886); *Répertoire du théâtre comique en France au moyen âge* (1886); and *Le Théâtre en France, histoire de la littérature dramatique depuis ses origines jusqu'à nos jours* (1889). Petit de Julleville was also the general editor of the *Histoire de la langue et de la littérature française* (8 vols., 1896–1900), to which he himself contributed some valuable chapters.

PETITION (Lat. for "seeking" or "praying"), a term meaning generally a prayerful request, and in its more important constitutional aspect an application for redress by a person aggrieved to an authority capable of relieving him. It may be made in the United Kingdom to the Crown or its officers, or to either house of parliament, or in certain cases to courts of justice.

Petitions to the Crown.—The right of petitioning the Crown was recognized indirectly as early as Magna Carta in the famous clause, *Nulli vendemus, nulli negabimus aut differemus, rectum vel justitiam* (25 Edw. I. c. 29), and directly at various periods later, *e.g.* in the articles of the Commons assented to by Henry IV., by which the king was to assign two days in the week for petitions (*Rot. Parl.* 8 Hen. IV., p. 585). The case of the seven bishops in 1688 confirmed the right, and finally the Bill of Rights in 1689 declared "that it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal." Petitions to the Crown appear to have been at first for the redress of private and local grievances, or for remedies which the courts of law could not grant (May, *Parl. Pr.*, 11th ed., 522). As equity grew into a system, petitions of this kind not seeking legislative remedies tended to become superseded by bills in chancery. Statutes were originally drawn up by the judges at the close of the session of parliament from the petitions of the Commons and the answers of the Crown. Under this system of drafting it was found that the tenor of the petition and answer were not always stated correctly. To obviate this inconvenience demands for legislation came in the reign of Henry VI. to be drawn up in the form of bills which the Crown could accept or reject, but could not alter (see Anson, *Law and Custom of the Constitution*, 3rd ed., vol. i. p. 241). In the same reign the words "by authority of parliament" were added to the words of enactment, and from the time of Henry VII. public legislation has been by bill and not by petition. A relic of the old form of statute founded upon petition still remains however in the preamble of Appropriation Acts and other statutes creating a charge upon the public revenue. It runs thus: "We, your majesty's most dutiful and loyal subjects, the Commons of the United Kingdom . . . do most humbly beseech your majesty that it may be enacted; and be it enacted," &c., from this point following the enacting words common to all statutes. The Crown may refer petitions presented to it to be adjudicated upon by a delegated authority. This course is pursued in the case of claims to peerages and offices of honour, which are referred to the House of Lords, and by that house to its committee for privileges, and in the case of petitions to the Crown in council, which are usually referred to the judicial committee. The Crown may delegate the power of receiving petitions in the first instance.

Petitions to Parliament.—Petitions to either house of the legislature seem to have been later in origin than petitions to the Crown. They are not referred to in the Bill of Rights, but the right of petition is a convention of the constitution. Petitions to the Lords or the whole parliament can be traced back to Henry III. No petition to the Commons has been found earlier than Richard II.; but from the time of Henry IV. petitions to the Commons have been freely made. The political importance of petitioning dates from about the reign of Charles I. The development of the practice of petitioning had proceeded so far in the reign of Charles II. as to lead to the passing in 1662 of an act (13 Car. II. c. 5) against "tumultuous petitioning," which is still on the statute book. It provides that no petition or address shall be presented to the king or either house of parliament by more than ten persons; nor shall any one procure above twenty persons to consent or set their hands to any petition for alteration of matters established by law in church or state, unless with the previous order of three justices of the county, or the major part of the grand jury. And in 1817 (57 Geo. III. c. 19, s. 23) meetings within a mile from Westminster Hall for the purpose of considering a petition to both houses or either house of parliament while either house is sitting were declared to be unlawful assemblies. Up to 1688 petitions to either house usually dealt only with some specific grievance. From that time dates the present practice of petitioning with regard to general measures of public policy. Petitions to the Houses of Lords or Commons must be framed in the form prescribed by the standing orders, must be properly superscribed, and must conclude with a prayer (May, *Parl. Pr.*, 11th ed., 524, 525). They may be sent free by post to members of either house if they fulfil certain conditions as to weight, &c. (*loc. cit.* p. 531).

Petitions to the Commons must be in writing, must contain none but genuine signatures, and must be free from disrespectful language or imputations upon any tribunal or constituted authority. They must be presented by a member of the house, except petitions to the House of Commons from the corporation of London, which may be presented at the bar by the sheriffs, and from the corporation of Dublin, which may be presented by the lord mayor. There is no means of compelling a member to present a petition. The rules as to petitions to the House of Lords are similar. The lord who presents a petition is required to read it to see whether in form and contents it is fit for presentation. In the Lords receivers and triers of petitions from Great Britain and Ireland and from Gascony and the lands and countries beyond the sea were appointed until 1886, though their functions had long been obsolete. Applications for leave to bring before either house bills for private or local and personal matters must under the standing orders of both houses be made by petition; and the same rule obtains as to applications for leave to be heard in opposition to such bills.

See Clifford, *History of Private Bill Legislation* (1887); May, *Parl. Pr.* (11th ed.), c. xxv.

Petitions to Courts of Justice.—Strictly speaking, these are an indirect mode of petitioning the Crown, for in the theory of English law the Crown is the fountain of justice. But it is more convenient to treat them separately, as they now form a part of the practice of the courts. Appeals to the House of Lords and the privy council are prosecuted by petition of appeal. The

PETŐFI, ALEXANDER (1823–1849), Hungarian lyric poet, was born at Kis-Körösö, Pest county, on New Year's Day, 1823. The family received its diploma of nobility from the emperor Leopold in 1688, but the ultra-patriotic Alexander early changed the old family name, Petrovics, which pointed to a Croatian origin, into the purely Magyar form of Petőfi. The lad's early days were spent at Félegyház and Szabadszállás, the most Hungarian parts of Hungary, where he got most of his early education, including a good grounding in Latin. German he learnt subsequently at Pesth, and French he taught himself. He began writing verses in his twelfth year, while a student at the Aszód gymnasium, where he also displayed a strong predilection for the stage, to the disgust of his rigorous father, who formally disowned his son, early in 1839, for some trifling peccadillo, and whose tyrannical temper became downright furious when a series of misfortunes ruined him utterly in 1840. For the next three years Petőfi led the wretched life of a strolling player, except for a brief interval when, to escape starvation, he enlisted as a common soldier in an infantry regiment. During the greater part of 1842 we find him a student at the Calvinist College at Pápá, where he made the acquaintance of young Jókai, and wrote the poem "Borozó," which the great critic Bajza at once inserted in the leading literary review, the *Athenaeum* (May 22, 1842). In November of the same year the restless poet quitted Pápá to join another travelling troupe, playing on one occasion the Fool in *King Lear*, and after wandering all over Hungary and suffering incredible hardships, finally settled down at Pesth (1844), where for a time he supported himself by all sorts of literary hack-work. Nevertheless, in the midst of his worst privations he had read voraciously, and was at this time profoundly influenced by the dominant Romanticism of the day; while, through Tieck, he learnt to know and value the works of Shakespeare. His first volume of original poems was published in 1844 by the Society Nemzeti Kör, through the influence of the poet Vorösmarty, when every publisher had refused his MS., and the seventy-five florins which he got for it had become a matter of life or death to him. He now became a regular contributor to the leading papers of Pesth, and was reconciled to his parents, whom he practically supported for the rest of their lives out of his literary earnings. His position, if not exactly brilliant, was now at least secure. The little volume published by the Nemzeti Kör was followed by the parody, *A Helység Kalapácsa* (1844); the romantic epic *János Vitéz* (1844); *Ciprislombok Etelké Sirjáról*, a collection of passionate elegies over his lost love, Etelké Csapó (1845); *Uti Jegyzetek*, an imitation of Heine's *Reisebilder* (1845); *Szerelem Gyöngyei* (1845); *Felhök* (1846); *Szerelme ès házassága* (1846), and many other volumes. The first edition of his collected poems appeared in 1847. Petőfi was not yet twenty-five, and, despite the protests of the classicists, who regarded him with cold dislike, the best heads in Hungary, poets like Vörösmarty and critics like Szemere, already paid him the homage due to the prince of Magyar lyrical poets. The great public was enthusiastic on the same side, and posterity, too, has placed him among the immortals. Petőfi is as simple and genuine a poet of nature as Wordsworth or Christian Winther, and his erotics, inspired throughout by a noble idealism, have all Byron's force and fervour, though it is perhaps in his martial songs that Petőfi's essentially passionate and defiant genius asserts itself most triumphantly. On the 8th of September 1847 Petőfi married Julia Szendrey, who bore him a son. When the revolutionary war broke out, he espoused the tenets of the extreme democratic faction with a heat and recklessness which estranged many of his friends. He took an active part in the Transylvanian campaigns of the heroic Bem; rose by sheer valour to the rank of major; was slain at the battle of Segesvár (July 31, 1849), and his body, which was never recovered, is supposed to have been buried in the common grave of the fallen honveds in the churchyard of Fehéregyház. The first complete edition of Petőfi's poems appeared in 1874. The best critical edition is that of Haras, 1894. There are numerous indifferent German translations.

See Ferenczi, *Petőfi Életrajza*; Fischer, *Petőfi's Leben und Werke*. (R. N. B.)

PETOSKEY, a city and the county-seat of Emmet county, Michigan, U.S.A., on Little Traverse Bay, an arm of Lake Michigan, at the mouth of Bear Creek, in the north-west part of the lower peninsula. Pop. (1890), 2872; (1900), 5285, of whom 856 were foreign-born; (1904, state census), 5186. It is served by the Père Marquette and the Grand Rapids & Indiana railways and by steamboat lines to Chicago, Detroit, Buffalo and other lake ports. Bear Creek furnishes considerable water power, and among the manufactures are lumber, paper, leather and foundry and machine-shop products. Petoskey was settled about 1874, was incorporated as a village in 1879, was chartered as a city in 1895, and in 1902 replaced Harbour Springs as county-seat. It was named after an Ojibwa Indian chief.

PETRA (ἡ Πέτρα—the rock), a ruined site, 30° 19′ N. and 35° 31′ E., lying in a basin among the mountains which form the eastern flank of Wadi el-'Arāba, the great valley running from the Dead Sea to the Gulf of 'Aḳăba. The descriptions of Strabo (xvi. p. 779), Pliny (*N.H.* vi. 32) and other writers leave no doubt as to the identity of this site with the famous capital of the Nabataeans (*q.v.*) and the centre of their caravan trade. Walled in by towering rocks and watered by a perennial stream, Petra not only possessed the advantages of a fortress but controlled the main commercial routes which passed through it to Gaza in the west, to Bostra and Damascus in the north, to Elath and Leucè Comè on the Red Sea, and across the desert to the Persian Gulf.

From the 'Arāba travellers approach by a track which leads round Jebel Hārūn (Mt Hor) and enters the plain of Petra from the south; it is just possible to find a way in from the high plateau on the north; but the most impressive entrance is from the east, down a dark and narrow gorge, in places only 10 or 12 ft. wide, called the Sīḳ, *i.e.* the shaft, a split in the huge sandstone rocks which serves as the waterway of the Wadi Mūsā. Near the end of the defile stands the most elaborate of the ruins, el-Ḥazne or "the Treasury of Pharaoh," not built but hewn out of the cliff; a little farther on, at the foot of the mountain called en-Nejr, comes the theatre, so placed as to bring the greatest number of tombs within view; and at the point where the valley opens out into the plain the site of the city is revealed with striking effect. Almost enclosing it on three sides are rose-coloured mountain walls, divided into groups by deep fissures, and lined with rock-cut tombs in the form of towers. The stream of Wadi Mūsā crosses the plain and disappears among the mountains opposite; on either bank, where the ground is fairly level, the city was built, covering a space of about 1½ sq. m. Among the ruins on the south bank stand the fragments of a temple called Ḳaṣr Fir'aun of late Roman date; just beyond this rises a rocky height which is usually regarded as the acropolis.

A position of such natural strength must have been occupied early, but we have no means of telling exactly when the history of Petra began; the evidence seems to show that the city was of relatively late foundation, though a sanctuary (see below) may have existed there from very ancient times. This part of the country was assigned by tradition to the Horites, *i.e.* probably "cave-dwellers," the predecessors of the Edomites (Gen. xiv. 6, xxxvi. 20–30; Deut. ii. 12); the habits of the original natives may have influenced the Nabataean custom of burying the dead and offering worship in half-excavated caves.[1] But that Petra itself is mentioned in the Old Testament cannot be affirmed with certainty; for though Petra is usually identified with Sela'[2] which also means "a rock," the reference in Judges i. 36; Isa. xvi. 1, xlii. 11; Obad. 3, is far from clear. 2 Kings xiv. 7 seems to be more explicit; in the parallel passage, however, Sela' is understood to mean simply "the rock" (2 Chr. xxv. 12, see LXX). Hence many authorities doubt whether any town named Sela' is mentioned in the Old Testament.[3] What, then, did the Semitic

in 1685, and those with Morocco in 1687; and the zeal, tact and linguistic knowledge he manifested in these and other transactions with Eastern courts were at last rewarded in 1692 by his appointment to the Arabic chair in the Collège Royal de France, which he filled until his death in 1713.

He published *Contes turcs* (Paris, 1707), and *Les Mille et un jours* (5 vols., Paris, 1710 1712); an *Armenian Dictionary* and an *Account of Ethiopia*. But the lasting monument of his literary fame is his excellent French version of Sharaf-uddīn 'Alī Yazdi's *Zafarnāma* or *History of Tīmūr* (completed 828 A.H.: A.D. 1425), which was given to the world nine years after his death (4 vols., Paris, 1722; Eng. trans. by J. Darby, London, 1723). This work, one of the rare specimens of a fairly critical history Persia can boast of, was compiled under the auspices of Mīrzā Ibrāhīm Sultān, the son of Shāh Rukh and grandson of the great Tīmūr. The only error committed by Pétis de la Croix in his otherwise very correct translation is that he erroneously ascribed the important share which Ibrāhīm Sultān had in the *Zafarnāma* to Tīmūr himself.

PETIT, SIR DINSHAW MANECKJI, BART. (1823–1901), Parsee philanthropist, was born on the 30th of June 1823. As broker to European firms he amassed a large fortune during the period of speculation in Bombay at the time of the American Civil War. In 1886 he became a member of the governor-general's legislative council. He devoted his wealth to philanthropic objects, among the public and private charities which he endowed being the Towers of Silence and fire temples of the Parsees, a hospital for animals, a college for women, and the Petit hospital. He was knighted in 1887, created a baronet in 1890, and died in February 1901.

PETIT DE JULLEVILLE, LOUIS (1841–1900), French scholar, was born in Paris on the 18th of July 1841. Educated at the École Normale Supérieure, and at the French school at Athens, he received his doctorate in literature in 1868. After holding various posts as a teacher he became professor of French medieval literature and of the history of the French language in the university of Paris in 1886. He died on the 28th of August 1900.

His most important works are: *Histoire du théâtre en France*, including *Les Mystères* (2 vols., 1880); *Les Comédiens en France au moyen âge* (1885); *La Comédie et les mœurs en France au moyen âge* (1886); *Répertoire du théâtre comique en France au moyen âge* (1886); and *Le Théâtre en France, histoire de la littérature dramatique depuis ses origines jusqu'à nos jours* (1889). Petit de Julleville was also the general editor of the *Histoire de la langue et de la littérature française* (8 vols., 1896–1900), to which he himself contributed some valuable chapters.

PETITION (Lat. for "seeking" or "praying"), a term meaning generally a prayerful request, and in its more important constitutional aspect an application for redress by a person aggrieved to an authority capable of relieving him. It may be made in the United Kingdom to the Crown or its officers, or to either house of parliament, or in certain cases to courts of justice.

Petitions to the Crown.—The right of petitioning the Crown was recognized indirectly as early as Magna Carta in the famous clause, ***Nulli vendemus, nulli negabimus aut differemus, rectum vel justitiam*** (25 Edw. I. c. 29), and directly at various periods later, *e.g.* in the articles of the Commons assented to by Henry IV., by which the king was to assign two days in the week for petitions (*Rot. Parl.* 8 Hen. IV., p. 585). The case of the seven bishops in 1688 confirmed the right, and finally the Bill of Rights in 1689 declared "that it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal." Petitions to the Crown appear to have been at first for the redress of private and local grievances, or for remedies which the courts of law could not grant (May, *Parl. Pr.*, 11th ed., 522). As equity grew into a system, petitions of this kind not seeking legislative remedies tended to become superseded by bills in chancery. Statutes were originally drawn up by the judges at the close of the session of parliament from the petitions of the Commons and the answers of the Crown. Under this system of drafting it was found that the tenor of the petition and answer were not always stated correctly. To obviate this inconvenience demands for legislation came in the reign of Henry VI. to be drawn up in the form of bills which the Crown could accept or reject, but could not alter (see Anson, *Law and Custom of the Constitution*, 3rd ed., vol. i. p. 241). In the same reign the words "by authority of parliament" were added to the words of enactment, and from the time of Henry VII. public legislation has been by bill and not by petition. A relic of the old form of statute founded upon petition still remains however in the preamble of Appropriation Acts and other statutes creating a charge upon the public revenue. It runs thus: "We, your majesty's most dutiful and loyal subjects, the Commons of the United Kingdom . . . do most humbly beseech your majesty that it may be enacted; and be it enacted," &c., from this point following the enacting words common to all statutes. The Crown may refer petitions presented to it to be adjudicated upon by a delegated authority. This course is pursued in the case of claims to peerages and offices of honour, which are referred to the House of Lords, and by that house to its committee for privileges, and in the case of petitions to the Crown in council, which are usually referred to the judicial committee. The Crown may delegate the power of receiving petitions in the first instance.

Petitions to Parliament.—Petitions to either house of the legislature seem to have been later in origin than petitions to the Crown. They are not referred to in the Bill of Rights, but the right of petition is a convention of the constitution. Petitions to the Lords or the whole parliament can be traced back to Henry III. No petition to the Commons has been found earlier than Richard II.; but from the time of Henry IV. petitions to the Commons have been freely made. The political importance of petitioning dates from about the reign of Charles I. The development of the practice of petitioning had proceeded so far in the reign of Charles II. as to lead to the passing in 1662 of an act (13 Car. II. c. 5) against "tumultuous petitioning," which is still on the statute book. It provides that no petition or address shall be presented to the king or either house of parliament by more than ten persons; nor shall any one procure above twenty persons to consent or set their hands to any petition for alteration of matters established by law in church or state, unless with the previous order of three justices of the county, or the major part of the grand jury. And in 1817 (57 Geo. III. c. 19, s. 23) meetings within a mile from Westminster Hall for the purpose of considering a petition to both houses or either house of parliament while either house is sitting were declared to be unlawful assemblies. Up to 1688 petitions to either house usually dealt only with some specific grievance. From that time dates the present practice of petitioning with regard to general measures of public policy. Petitions to the Houses of Lords or Commons must be framed in the form prescribed by the standing orders, must be properly superscribed, and must conclude with a prayer (May, *Parl. Pr.*, 11th ed., 524, 525). They may be sent free by post to members of either house if they fulfil certain conditions as to weight, &c. (*loc. cit.* p. 531).

Petitions to the Commons must be in writing, must contain none but genuine signatures, and must be free from disrespectful language or imputations upon any tribunal or constituted authority. They must be presented by a member of the house, except petitions to the House of Commons from the corporation of London, which may be presented at the bar by the sheriffs, and from the corporation of Dublin, which may be presented by the lord mayor. There is no means of compelling a member to present a petition. The rules as to petitions to the House of Lords are similar. The lord who presents a petition is required to read it to see whether in form and contents it is fit for presentation. In the Lords receivers and triers of petitions from Great Britain and Ireland and from Gascony and the lands and countries beyond the sea were appointed until 1886, though their functions had long been obsolete. Applications for leave to bring before either house bills for private or local and personal matters must under the standing orders of both houses be made by petition; and the same rule obtains as to applications for leave to be heard in opposition to such bills.

See Clifford, *History of Private Bill Legislation* (1887); May, *Parl. Pr.* (11th ed.), c. xxv.

Petitions to Courts of Justice.—Strictly speaking, these are an indirect mode of petitioning the Crown, for in the theory of English law the Crown is the fountain of justice. But it is more convenient to treat them separately, as they now form a part of the practice of the courts. Appeals to the House of Lords and the privy council are prosecuted by petition of appeal. The

took refuge in the Ghibelline township of Arezzo; and it was here, on the very night when his father, in company with other members of the White party, made an unsuccessful attempt to enter Florence by force, that Francesco first saw the light. He did not remain long in his birthplace. His mother, having obtained permission to return from banishment, settled at Incisa, a little village on the Arno above Florence, in February 1305. Here Petrarch spent seven years of boyhood, acquiring that pure Tuscan idiom which afterwards he used with such consummate mastery in ode and sonnet. Here too, in 1307, his brother Gherardo was born. In 1312 Petracco set up a house for his family at Pisa; but soon afterwards, finding no scope there for the exercise of his profession as jurist, he removed them all in 1313 to Avignon. This was a step of no small importance for the future poet-scholar. Avignon at that period still belonged to Provence, and owned King Robert of Naples as sovereign. But the popes had made it their residence after the insults offered to Boniface VIII. at Anagni in 1303. Avignon was therefore the centre of that varied society which the high pontiffs of Christendom have ever gathered round them. Nowhere else could the youth of genius who was destined to impress a cosmopolitan stamp on medieval culture and to begin the modern era have grown up under conditions more favourable to his task. At Incisa and at Pisa he had learned his mother-tongue. At Carpentras, under the direction of Convennole of Prato, he studied the humanities between the years 1315 and 1319. Avignon, at a distance from the party strife and somewhat parochial politics of the Italian commonwealths, impressed his mind with an ideal of civility raised far above provincial prejudices.

Petrarch's real name according to Tuscan usage was Francesco di Petracco. But he altered this patronymic, for the sake of euphony, to Petrarca, proving by this slight change his emancipation from usages which, had he dwelt at Florence, would most probably have been imposed on him. Petracco, who was very anxious that his eldest son should become an eminent jurist, sent him at the age of fifteen to study law at Montpellier. Like Ovid and many other poets, Petrarch felt no inclination for his father's profession. His intellect, indeed, was not incapable of understanding and admiring the majestic edifice of Roman law; but he shrank with disgust from the illiberal technicalities of practice. There is an authentic story of Petracco's flinging the young student's books of poetry and rhetoric upon the fire, but saving Virgil and Cicero half-burned from the flames at his son's passionate entreaties. Notwithstanding Petrarch's firm determination to make himself a scholar and a man of letters rather than a lawyer, he so far submitted to his father's wishes as to remove about the year 1323 to Bologna, which was then the headquarters of juristic learning. There he stayed with his brother Gherardo until 1326, when his father died, and he returned to Avignon. Banishment and change of place had already diminished Petracco's fortune, which was never large; and a fraudulent administration of his estate after his death left the two heirs in almost complete destitution. The most precious remnant of Petrarch's inheritance was a MS. of Cicero. There remained no course open for him but to take orders. This he did at once on his arrival in Provence; and we have good reason to believe that he advanced in due time to the rank of priest. A great Roman noble and ecclesiastic, Giacomo Colonna, afterwards bishop of Lombez, now befriended him, and Petrarch lived for some years in partial dependence on this patron.

On the 6th of April 1327 happened the most famous event of Petrarch's history. He saw Laura for the first time in the church of St Clara at Avignon. Who Laura was remains uncertain still. That she was the daughter of Audibert de Noves and the wife of Hugh de Sade rests partly on tradition and partly on documents which the abbé de Sade professed to have copied from originals in the 18th century. Nothing is now extant to prove that, if this lady really existed, she was the Laura of the *Canzoniere*, while there are reasons for suspecting that the abbé was either the fabricator of a romance flattering to his own family, or the dupe of some previous impostor. We may, however, reject the sceptical hypothesis that Laura was a mere figment of Petrarch's fancy; and, if we accept her personal reality, the poems of her lover demonstrate that she was a married woman with whom he enjoyed a respectful and not very intimate friendship.

Petrarch's inner life after this date is mainly occupied with the passion which he celebrated in his Italian poems, and with the friendships which his Latin epistles dimly reveal to us. Besides the bishop of Lombez he was now on terms of intimacy with another member of the great Colonna family, the cardinal Giovanni. A German, Ludwig, whom he called Socrates, and a Roman, Lello, who received from him the classic name of Laellius, were among his best-loved associates. Avignon was the chief seat of his residence up to the year of 1333, when he became restless and undertook his first long journey. On this occasion he visited Paris, Ghent, Liége, Cologne, making the acquaintance of learned men and copying the manuscripts of classical authors. On his return to Avignon he engaged in public affairs, pleaded the cause of the Scaligers in their lawsuit with the Rossi for the lordship of Parma, and addressed two poetical epistles to Pope Benedict XII. upon the restoration of the papal see to Rome. His eloquence on behalf of the tyrants of Verona was successful. It won him the friendship of their ambassador, Azzo di Correggio—a fact which subsequently influenced his life in no small measure. Not very long after these events Petrarch made his first journey to Rome, a journey memorable from the account which he has left us of the impression he received from its ruins.

It was some time in the year 1337 that he established himself at Vaucluse and began that life of solitary study, heightened by communion with nature in her loneliest and wildest moods, which distinguished him in so remarkable a degree from the common herd of medieval scholars. Here he spent his time partly among books, meditating on Roman history, and preparing himself for the Latin epic of *Africa*. In his hours of recreation he climbed the hills or traced the Sorgues from its fountain under those tall limestone cliffs, while odes and sonnets to Madonna Laura were committed from his memory to paper. We may also refer many of his most important treatises in prose, as well as a large portion of his Latin correspondence, to the leisure he enjoyed in this retreat. Some woman, unknown to us by name, made him the father of a son, Giovanni, in the year 1337; and she was probably the same who brought him a daughter, Francesca, in 1343. Both children were afterwards legitimized by papal bulls. Meanwhile his fame as a poet in the Latin and the vulgar tongues steadily increased, until, when the first draughts of the *Africa* began to circulate about the year 1339, it became manifest that no one had a better right to the laurel crown than Petrarch. A desire for glory was one of the most deeply-rooted passions of his nature, and one of the points in which he most strikingly anticipated the humanistic scholars who succeeded him. It is not, therefore, surprising to find that he exerted his influence in several quarters with the view to obtaining the honours of a public coronation. The result of his intrigues was that on a single day in 1340, the 1st of September, he received two invitations, from the university of Paris and from King Robert of Naples respectively. He chose to accept the latter, journeyed in February 1341 to Naples, was honourably entertained by the king, and, after some formal disputations on matters touching the poet's art, was sent with magnificent credentials to Rome. There, in the month of April, Petrarch assumed the poet's crown upon the Capitol from the hand of the Roman senator amid the plaudits of the people and the patricians. The oration which he delivered on this occasion was composed upon these words of Virgil:—

> "Sed me Parnassi deserta per ardua dulcis
> Raptat amor."

The ancient and the modern eras met together on the Capitol at Petrarch's coronation, and a new stadium for the human spirit, that which we are wont to style Renaissance, was opened.

With the coronation in Rome a fresh chapter in the biography of Petrarch may be said to have begun. Henceforth he ranked as a rhetorician and a poet of European celebrity, the guest of princes, and the ambassador to royal courts. During the spring months of 1341 his friend Azzo di Correggio had succeeded in freeing Parma from subjugation to the Scaligers, and was laying

the foundations of his own tyranny in that city. He invited Petrarch to attend him when he made his triumphal entry at the end of May; and from this time forward for a considerable period Parma and Vaucluse were the two headquarters of the poet. The one he called his Transalpine, the other his Cisalpine Parnassus. The events of the next six years of his life, from May 1341 to May 1347, may be briefly recapitulated. He lost his old friend the bishop of Lombez by death and his brother Gherardo by the entrance of the latter into a Carthusian monastery. Various small benefices were conferred upon him; and repeated offers of a papal secretaryship, which would have raised him to the highest dignities, were made and rejected. Petrarch remained true to the instinct of his own vocation, and had no intention of sacrificing his studies and his glory to ecclesiastical ambition. In January 1343 his old friend and patron Robert, king of Naples, died, and Petrarch was sent on an embassy from the papal court to his successor Joan. The notices which he has left us of Neapolitan society at this epoch are interesting, and, it was now, perhaps, that he met Boccaccio for the first time. The beginning of the year 1345 was marked by an event more interesting in the scholar's eyes than any change in dynasties. This was no less than a discovery at Verona of Cicero's *Familiar Letters*. It is much to be regretted that Petrarch found the precious MS. so late in life, when the style of his own epistles had been already modelled upon that of Seneca and St Augustine.

In the month of May 1347 Cola di Rienzi accomplished that extraordinary revolution which for a short space revived the republic in Rome, and raised this enthusiast to titular equality with kings. Petrarch, who in politics was no less visionary than Rienzi, hailed the advent of a founder and deliverer in the self-styled tribune. Without considering the impossibility of restoring the majesty of ancient Rome, or the absurdity of dignifying the medieval Roman rabble by the name of Populus Romanus, he threw himself with passion into the republican movement, and sacrificed his old friends of the Colonna family to what he judged a patriotic duty.

Petrarch built himself a house at Parma in the autumn of 1347. Here he hoped to pursue the tranquil avocations of a poet honoured by men of the world and men of letters throughout Europe, and of an idealistic politician, whose effusions on the questions of the day were read with pleasure for their style. But in the course of the next two years this agreeable prospect was overclouded by a series of calamities. Laura died of the plague on the 6th of April 1348. Francesco degli Albizzi, Mainardo Accursio, Roberto de' Bardi, Sennuccio del Bene, Luchino Visconti, the cardinal Giovanni Colonna and several other friends followed to the grave in rapid succession. All of these had been intimate acquaintances and correspondents of the poet. Friendship with him was a passion; or, what is more true perhaps, he needed friends for the maintenance of his intellectual activity at the highest point of its effectiveness. Therefore he felt the loss of these men acutely. We may say with certainty that Laura's death, accompanied by that of so many distinguished associates, was the turning-point in Petrarch's inner life. He began to think of quitting the world, and pondered a plan for establishing a kind of humanistic convent, where he might dedicate himself, in the company of kindred spirits, to still severer studies and a closer communion with God. Though nothing came of this scheme, a marked change was henceforth perceptible in Petrarch's literary compositions. The poems written *In Morte di Madonna Laura* are graver and of more religious tone. The prose works touch on retrospective topics or deal with subjects of deep meditation. At the same time his renown, continually spreading, opened to him ever fresh relations with Italian despots. The noble houses of Gonzaga at Mantua, of Carrara at Padua, of Este at Ferrara, of Malatesta at Rimini, of Visconti at Milan, vied with Azzo di Correggio in entertaining the illustrious man of letters. It was in vain that his correspondents pointed out the discrepancy between his professed zeal for Italian liberties, his recent enthusiasm for the Roman republic, and this alliance with tyrants who were destroying the freedom of the Lombard cities. Petrarch remained an incurable rhetorician; and, while he stigmatized the despots in his ode to Italy and in his epistles to the emperor he accepted their hospitality. They, on their part, seem to have understood his temperament, and to have agreed to recognize his political theories as of no practical importance. The tendency to honour men of letters and to patronize the arts which distinguished Italian princes throughout the Renaissance period first manifested itself in the attitude assumed by Visconti and Carraresi to Petrarch.

When the jubilee of 1350 was proclaimed, Petrarch made a pilgrimage to Rome, passing and returning through Florence, where he established a firm friendship with Boccaccio. It has been well remarked that, while all his other friendships are shadowy and dim, this one alone stands out with clearness. Each of the two friends had a distinguished personality. Each played a foremost part in the revival of learning. Boccaccio carried his admiration for Petrarch to the point of worship. Petrarch repaid him with sympathy, counsel in literary studies, and moral support which helped to elevate and purify the younger poet's over-sensuous nature. It was Boccaccio who in the spring of 1351 brought to Petrarch, then resident with the Carrara family at Padua, an invitation from the seigniory of Florence to accept the rectorship of their recently founded university. This was accompanied by a diploma of restoration to his rights as citizen and restitution of his patrimony. But, flattering as was the offer, Petrarch declined it. He preferred his literary leisure at Vaucluse, at Parma, in the courts of princes, to a post which would have brought him into contact with jealous priors and have reduced him to the position of the servant of a commonwealth. Accordingly, we find him journeying again in 1351 to Vaucluse, again refusing the office of papal secretary, again planning visionary reforms for the Roman people, and beginning that curious fragment of an autobiography which is known as the *Epistle to Posterity*. Early in 1353 he left Avignon for the last time, and entered Lombardy by the pass of Mont Genèvre, making his way immediately to Milan. The archbishop Giovanni Visconti was at this period virtually despot of Milan. He induced Petrarch, who had long been a friend of the Visconti family, to establish himself at his court, where he found employment for him as ambassador and orator. The most memorable of his diplomatic missions was to Venice in the autumn of 1353. Towards the close of the long struggle between Genoa and the republic of St Mark the Genoese entreated Giovanni Visconti to mediate on their behalf with the Venetians. Petrarch was entrusted with the office; and on the 8th of November he delivered a studied oration before the doge Andrea Dandolo and the great council. His eloquence had no effect; but the orator entered into relations with the Venetian aristocracy which were afterwards extended and confirmed. Meanwhile, Milan continued to be his place of residence. After Giovanni's death he remained in the court of Bernabò and Galeazzo Visconti, closing his eyes to their cruelties and exactions, serving them as a diplomatist, making speeches for them on ceremonial occasions, and partaking of the splendid hospitality they offered to emperors and princes. It was in this capacity of an independent man of letters, highly placed and favoured at one of the most wealthy courts of Europe, that he addressed epistles to the emperor Charles IV. upon the distracted state of Italy, and entreated him to resume the old Ghibelline policy of Imperial interference. Charles IV. passed through Mantua in the autumn of 1354. There Petrarch made his acquaintance, and, finding him a man unfit for any noble enterprise, declined attending him to Rome. When Charles returned to Germany, after assuming the crowns in Rome and Milan, Petrarch addressed a letter of vehement invective and reproach to the emperor who was so negligent of the duties imposed on him by his high office. This did not prevent the Visconti sending him on an embassy to Charles in 1356. Petrarch found him at Prague, and, after pleading the cause of his masters, was despatched with honour and the diploma of count palatine. His student's life at Milan was again interrupted in 1360 by a mission on which Galeazzo Visconti sent him to King John of France. The tyrants of Milan were aspiring to royal alliances; Gian Galeazzo Visconti had been married to Isabella of France;

Violante Visconti, a few years later, was wedded to the English duke of Clarence. Petrarch was now commissioned to congratulate King John upon his liberation from captivity to England. This duty performed, he returned to Milan, where in 1361 he received news of the deaths of his son Giovanni and his old friend Socrates. Both had been carried off by plague.

The remaining years of Petrarch's life, important as they were for the furtherance of humanistic studies, may be briefly condensed. On the 11th of May 1362 he settled at Padua, from the neighbourhood of which he never moved again to any great distance. The same year saw him at Venice, making a donation of his library to the republic of St Mark. Here his friend Boccaccio introduced to him the Greek teacher Leontius Pilatus. Petrarch, who possessed a MS. of Homer and a portion of Plato, never acquired the Greek language, although he attempted to gain some little knowledge of it in his later years. Homer, he said, was dumb to him, while he was deaf to Homer; and he could only approach the *Iliad* in Boccaccio's rude Latin version. About this period he saw his daughter Francesca happily married, and undertook the education of a young scholar from Ravenna, whose sudden disappearance from his household caused him the deepest grief. This youth has been identified, but on insufficient grounds, with that Giovanni Malpaghini of Ravenna who was destined to form a most important link between Petrarch and the humanists of the next age of culture. Gradually his oldest friends dropped off. Azzo di Correggio died in 1362, and Laelius, Simonides, Barbato, in the following year. His own death was reported in 1365; but he survived another decade. Much of this last stage of his life was occupied at Padua in a controversy with the Averroists, whom he regarded as dangerous antagonists both to sound religion and to sound culture. A curious treatise, which grew in part out of this dispute and out of a previous duel with physicians, was the book *Upon his own Ignorance and that of many others*. At last, in 1369, tired with the bustle of a town so big as Padua, he retired to Arquà, a village in the Euganean hills, where he continued his usual train of literary occupations, employing several secretaries, and studying unremittingly. All through these declining years his friendship with Boccaccio was maintained and strengthened. It rested on a solid basis of mutual affection and of common studies, the different temperaments of the two scholars securing them against the disagreements of rivalry or jealousy. One of Petrarch's last compositions was a Latin version of Boccaccio's story of Griselda. On the 18th of July 1374 his people found the old poet and scholar dead among his books in the library of that little house which looks across the hills and lowlands towards the Adriatic.

When we attempt to estimate Petrarch's position in the history of modern culture, the first thing which strikes us is that he was even less eminent as an Italian poet than as the founder of Humanism, the inaugurator of the Renaissance in Italy. What he achieved for the modern world was not merely to bequeath to his Italian imitators masterpieces of lyrical art unrivalled for perfection of workmanship, but also, and far more, to open out for Europe a new sphere of mental activity. Standing within the threshold of the middle ages, he surveyed the kingdom of the modern spirit, and, by his own inexhaustible industry in the field of scholarship and study, he determined what we call the revival of learning. By bringing the men of his own generation into sympathetic contact with antiquity, he gave a decisive impulse to that European movement which restored freedom, self-consciousness, and the faculty of progress to the human intellect. He was the first man to collect libraries, to accumulate coins, to advocate the preservation of MSS. For him the authors of the Greek and Latin world were living men—more real, in fact, than those with whom he corresponded; and the rhetorical epistles he addressed to Cicero, Seneca and Varro prove that he dwelt with them on terms of sympathetic intimacy. So far-reaching were the interests controlled by him in this capacity of humanist that his achievement as an Italian lyrist seems by comparison insignificant.

Petrarch's ideal of humanism was essentially a noble one. He regarded the orator and the poet as teachers, bound to complete themselves by education, and to exhibit to the world an image of perfected personality in prose and verse of studied beauty. Self-culture and self-effectuation seemed to him the highest aims of man. Everything which contributed to the formation of a free, impassioned, liberal individuality he regarded as praiseworthy. Everything which retarded the attainment of that end was contemptible in his eyes. The authors of antiquity, the Holy Scriptures and the fathers of the Church were valued by him as one common source of intellectual enlightenment. Eminently religious, and orthodox in his convictions, he did not seek to substitute a pagan for the Christian ideal. This was left for the scholars of the 15th and 16th centuries in Italy. At the same time, the Latin orators, historians and poets were venerated by him as depositories of a tradition only second in importance to revelation. For him there was no schism between Rome and Galilee, between classical genius and sacred inspiration. Though the latter took the first rank in relation to man's eternal welfare, the former was necessary for the perfection of his intellect and the civilization of his manners. With this double ideal in view, Petrarch poured scorn upon the French physicians and the Italian Averroists for their illiberal philistinism, no less than for their materialistic impiety. True to his conception of independent intellectual activity, he abstained from a legal career, refused important ecclesiastical office, and contented himself with paltry benefices which implied no spiritual or administrative duties, because he was resolved to follow the one purpose of his life—self-culture. Whatever in literature revealed the hearts of men was infinitely precious to him; and for this reason he professed almost a cult for St Augustine. It was to Augustine, as to a friend or a confessor, that he poured forth the secrets of his own soul in the book *De contemptu mundi*.

In this effort to realize his truest self Petrarch was eminently successful. Much as he effected by restoring to the world a sound conception of learning, and by rousing that genuine love and curiosity which led to the revival, he did even more by impressing on the age his own full-formed and striking personality. In all things he was original. Whether we regard him as a priest who published poem after poem in praise of an adored mistress, as a plebeian man of letters who conversed on equal terms with kings and princes, as a solitary dedicated to the love of nature, as an amateur diplomatist treating affairs of state with pompous eloquence in missives sent to popes and emperors, or again as a traveller eager for change of scene, ready to climb mountains for the enjoyment of broad prospects over spreading champaigns; in all these divers manifestations of his peculiar genius we trace some contrast with the manners of the 14th century, some emphatic anticipation of the 16th. The defects of Petrarch's character were no less striking than its qualities, and were indeed their complement and counterpart. That vivid conception of intellectual and moral self-culture which determined his ideal took the form in actual life of all-absorbing egotism. He was not content with knowing himself to be the leader of the age. He claimed autocracy, suffered no rival near his throne, brooked no contradiction, demanded unconditional submission to his will and judgment. Petrarch was made up of contradictions. Praising solitude, playing the hermit at Vaucluse, he only loved seclusion as a contrast to the society of courts. While he penned dissertations on the futility of fame and the burden of celebrity he was trimming his sails to catch the breeze of popular applause. No one professed a more austere morality, and few medieval writers indulged in cruder satire on the female sex; yet he passed some years in the society of a concubine, and his living masterpiece of art is the apotheosis of chivalrous passion for a woman. These discords of an undecided nature displayed themselves in his political theories and in his philosophy of conduct. In one mood he was fain to ape the antique patriot; in another he affected the monastic saint. He was clamorous for the freedom of the Roman people; yet at one time he called upon the popes to re-establish themselves in the Eternal City; at another he besought the emperor to make it his headquarters; at a third he hailed in Rienzi the founder of a new republic. He did not perceive that all these plans were

incompatible. His relations to the Lombard nobles were equally at variance with his professed patriotism; and, while still a housemate of Visconti and Correggi, he kept on issuing invectives against the tyrants who divided Italy. It would not be difficult to multiply these antitheses in the character and the opinions of this singular man. But it is more to the purpose to remark that they were harmonized in a personality of potent and enduring force.

The point to notice in this complex personality is that Petrarch's ideal remained always literary. As philosopher, politician, historian, essayist, orator, he aimed at lucid and harmonious expression—not, indeed, neglecting the importance of the material he undertook to treat, but approaching his task in the spirit of an artist rather than a thinker or a man of action. This accounts for his bewildering versatility, and for his apparent want of grasp on conditions of fact. Viewed in this light Petrarch anticipated the Italian Renaissance in its weakness—that philosophical superficiality, that tendency to ornate rhetoric, that preoccupation with stylistic trifles, that want of profound conviction and stern sincerity, which stamp its minor literary products with the note of mediocrity. Had Petrarch been possessed with a passion for some commanding principle in politics, morality or science, instead of with the thirst for self-glorification and the ideal of artistic culture, it is not wholly impossible that Italian humanism might have assumed a manlier and more conscientious tone. But this is not a question which admits of discussion; for the conditions which made Petrarch what he was were already potent in Italian society. He did but express the spirit of the period he opened; and it may also be added that his own ideal was higher and severer than that of the illustrious humanists who followed him.

As an author Petrarch must be considered from two points of view—first as a writer of Latin verse and prose, secondly as an Italian lyrist. In the former capacity he was speedily outstripped by more fortunate scholars. His eclogues and epistles and the epic of *Africa*, on which he set such store, exhibit a comparatively limited command of Latin metre. His treatises, orations, and familiar letters, though remarkable for a prose style which is eminently characteristic of the man, are not distinguished by purity of diction. Much as he admired Cicero, it is clear that he had not freed himself from current medieval Latinity. Seneca and Augustine had been too much used by him as models of composition. At the same time it will be conceded that he possessed a copious vocabulary, a fine ear for cadence, and the faculty of expressing every shade of thought or feeling. What he lacked was that insight into the best classical masterpieces, that command of the best classical diction, which is the product of successive generations of scholarship. To attain to this, Giovanni da Ravenna, Colluccio Salutato, Poggio and Filelfo had to labour, before a Poliziano and a Bembo finally prepared the path for an Erasmus. Had Petrarch been born at the close of the 15th instead of at the opening of the 14th century there is no doubt that his Latinity would have been as pure, as versatile, and as pointed as that of the witty stylist of Rotterdam.

With regard to his Italian poetry Petrarch occupies a very different position. The *Rime in Vita e Morte di Madonna Laura* cannot become obsolete, for perfect metrical form has here been married to language of the choicest and the purest. It is true that even in the *Canzoniere*, as Italians prefer to call that collection of lyrics, Petrarch is not devoid of faults belonging to his age, and affectations which have imposed themselves with disastrous effect through his authority upon the literature of Europe. He appealed in his odes and sonnets to a restricted audience already educated by the chivalrous love-poetry of Provence and by Italian imitations of that style. He was not careful to exclude the commonplaces of the school, nor anxious to finish a work of art wholly free from fashionable graces and from contemporary conceits. There is therefore a certain element of artificiality in his treatment; and this, since it is easier to copy defects than excellencies, has been perpetuated with wearisome monotony by versifiers who chose him for their model. But, after making due allowance for peculiarities, the abuse of which has brought the name of Petrarchist into contempt, we can agree with Shelley that the lyrics of the *Canzoniere* "are as spells which unseal the inmost enchanted fountains of the delight which is the grief of love." Much might be written about the peculiar position held by Petrarch between the metaphysical lyrists of Tuscany and the more realistic amorists of succeeding generations. True in this respect also to his anticipation of the coming age, he was the first Italian poet of love to free himself from allegory and mysticism. Yet he was far from approaching the analysis of emotion with the directness of a Heine or De Musset. Though we believe in the reality of Laura, we derive no clear conception either of her person or her character. She is not so much a woman as woman in the abstract; and perhaps on this very account the poems written for her by her lover have been taken to the heart by countless lovers who came after him. The method of his art is so generalizing, while his feeling is so natural, that every man can see himself reflected in the singer and his mistress shadowed forth in Laura. The same criticism might be passed on Petrarch's descriptions of nature. That he felt the beauties of nature keenly is certain, and he frequently touches them with obvious appreciation. Yet he has written nothing so characteristic of Vaucluse as to be inapplicable to any solitude where there are woods and water. The *Canzoniere* is therefore one long melodious monody poured from the poet's soul, with the indefinite form of a beautiful woman seated in a lovely landscape, a perpetual object of delightful contemplation. This disengagement from local circumstance without the sacrifice of emotional sincerity is a merit in Petrarch, but it became a fault in his imitators. Lacking his intensity of passion and his admirable faculty for seizing the most evanescent shades of difference in feeling, they degenerated into colourless and lifeless insipidities made insupportable by the frigid repetition of tropes and conceits which we are fain to pardon in the master.

Petrarch did not distinguish himself by love-poetry alone in the Italian language. His odes to Giacomo Colonna, to Cola di Rienzi and to the princes of Italy display him in another light. They exhibit the oratorical fervour, the pleader's eloquence in its most perfect lustre, which Petrarch possessed in no less measure than subjective passion. Modern literature has nothing nobler, nothing more harmonious in the declamatory style than these three patriotic effusions. Their spirit itself is epoch-making in the history of Europe. Up to this point Italy had scarcely begun to exist. There were Florentines and Lombards, Guelfs and Ghibellines; but even Dante had scarcely conceived of Italy as a nation, independent of the empire, inclusive of her several component commonwealths. To the high conception of Italian nationality, to the belief in that spiritual unity which underlay her many discords and divisions, Petrarch attained partly through his disengagement from civic and local partisanship, partly through his large and liberal ideal of culture.

The materials for a life of Petrarch are afforded in abundance by his letters, collected and prepared for publication under his own eyes. These are divided into *Familiar Correspondence*, *Correspondence in Old Age*, *Divers Letters* and *Letters without a Title*; to which may be added the curious autobiographical fragment entitled the *Epistle to Posterity*. Next in importance rank the epistles and eclogues in Latin verse, the Italian poems and the rhetorical addresses to popes, emperors, Cola di Rienzi, and some great men of antiquity. For the comprehension of his character the treatise *De contemptu mundi*, addressed to St Augustine and styled his Secret, is invaluable. Without attempting a complete list of Petrarch's works, it may be well to illustrate the extent of his erudition and his activity as a writer by a brief enumeration of the most important. In the section belonging to moral philosophy we find *De remediis utriusque fortunae*, a treatise on human happiness and unhappiness; *De vita solitaria*, a panegyric of solitude; *De otio religiosorum*, a similar essay on monastic life, inspired by a visit to his brother Gherardo in his convent near Marseilles. On historical subjects the most considerable are *Rerum memorandarum libri*, a miscellany from a student's commonplace-book, and *De viris illustribus*, an epitome of the biographies of Roman worthies. Three polemical works require mention: *Contra cujusdam anonymi Galli calumnias apologia*, *Contra medicum quendam invectivarum libri*, and *De sui ipsius et multorum ignorantia*—controversial and sarcastic compositions, which grew out of Petrarch's quarrels with the physicians of Avignon and the Averroists of Padua. In this connexion it might also be well to mention the remarkable

satires on the papal court, included in the *Epistolae sine titulo*. Five public orations have been preserved, the most weighty of which, in explanation of Petrarch's conception of literature, is the speech delivered on the Capitol upon the occasion of his coronation. Among his Latin poems *Africa*, an epic on Scipio Africanus, takes the first place. Twelve *Eclogues* and three books of *Epistles* in verse close the list. In Italian we possess the *Canzoniere*, which includes odes and sonnets written for Laura during her lifetime, those written for her after her death, and a miscellaneous section containing the three patriotic odes and three famous poetical invectives against the papal court. Besides these lyrical compositions are the semi-epical or allegorical *Trionfi*—Triumphs of Love, Chastity, Death, Fame, Time and Divinity, written in terza rima of smooth and limpid quality. Though these Triumphs, as a whole, are deficient in poetic inspiration, the second canto of the *Trionfo della morte*, in which Petrarch describes a vision of his dead love Laura, is justly famous for reserved passion and pathos tempered to a tranquil harmony.

The complete bibliography of Petrarch forms a considerable volume. Such a work was attempted by Domenico Rossetti (Trieste, 1828). It will be enough here to mention the Basel edition of 1581, in folio, as the basis for all subsequent editions of his collected works. Among editions of the *Canzoniere* special mention may be made of those of Marsand (Padua, 1820), Leopardi in Le Monnier's collection, Mestica (1895), and Carducci (1899). Nor must Fracassetti's Italian version of the *Letters* (published in 5 vols. by Le Monnier) be neglected. De Sade's *Life* of the poet (Amsterdam, 1764–1767) marks an epoch in the history of his numerous biographies; but this is in many important points untrustworthy, and it has been superseded by Gustav Koerting's exhaustive volume on *Petrarcas Leben und Werke* (Leipzig, 1878). Georg Voigt's *Wiederbelebung des classischen Alterthums* (Berlin, 1859) contains a well-digested estimate of Petrarch's relation to the revival of learning. Mézière's *Pétrarque* (1868) is a monograph of merit. English readers may be referred to a little book on Petrarch by Henry Reeve, and to vols. ii. and iv. of Symond's *Renaissance in Italy*. See also Maud F. Jerrold, *Francesco Petrarca, Poet and Humanist* (1909). (J. A. S.)

PETRE, SIR EDWARD (1631–1699), Jesuit confessor of King James II. of England, was born in Paris. He was the son of Sir Francis Petre, Bart., of Cranham, head of a junior branch of the family of the Barons Petre, and his wife Elizabeth Gage, daughter of Sir John Gage, both strong Roman Catholics. In 1649 he was sent for his education to the Jesuit College at St Omer, and he entered the order under the name of Spencer in 1652, but did not receive the full orders till 1671. In 1679 he succeeded his elder brother in the title and family estates. On the accession of James II. of 1685 he was chosen as confessor by the king, who looked upon him as "a resolute and undertaking man." During the whole of the king's reign Petre was one of his advisers who did the most to encourage him in the policy which ended by producing the revolution of 1688. The king contemplated making him archbishop of York, as the see was then vacant, but the pope, Innocent XI., who was not friendly to the order, would not grant a dispensation to hold it, and even directed Petre's superiors to rebuke him for his excessive ambition. In 1687 he was made privy councillor. When the revolution broke out Petre was compelled to flee disguised as a woman. After his flight he had no further relations with James II. After a visit to Rome, he became head of the Jesuit College at St Omer in 1693, from whence he was transferred to Walten in Flanders in 1697. He died on the 15th of May 1699. A younger brother Charles (1644–1712) was also a member of the order.

PETRE, SIR WILLIAM (*c.* 1505–1572), English politician, was a son of John Petre, a Devon man, and was educated at Exeter College, Oxford, afterwards becoming a fellow of All Souls' College. He entered the public service in early life, owing his introduction therein doubtless to the fact that at Oxford he had been tutor to Anne Boleyn's brother, George Boleyn, Viscount Rochford, and began his official career by serving the English government abroad. In 1536 he was made deputy, or proctor, for the vicar-general, Thomas Cromwell, and as such he presided over the convocation which met in June of this year. In 1543 Petre was knighted and was appointed a secretary of state; in 1545 he was sent as ambassador to the emperor Charles V. A very politic man, he retained his position under Edward VI. and also under Mary, forsaking the protector Somerset at the right moment and winning Mary's goodwill by favouring her marriage with Philip II. of Spain. He resigned his secretaryship in 1557, but took some part in public business under Elizabeth until his death at his residence, Ingatestone, Essex, on the 13th of January 1572.

His son John Petre (1549–1613) was created Baron Petre of Writtle in 1603. The 2nd baron was his son William (1575–1637), whose grandson was William, the 4th baron (*c.* 1626–1684). Denounced by Titus Oates as a papist, the last-named was arrested with other Roman Catholic noblemen in 1678 and remained without trial in the Tower of London until his death. His brother John (1629–1684) was the 5th lord, and the latter's nephew, Robert (1689–1713), was the 7th lord. It was Robert's action in cutting a lock of hair from a lady's head which led Pope to write his poem "The Rape of the Lock." The Petres have been consistently attached to the Roman Catholic faith, William Joseph, the 13th baron (1847–1893), being a priest of the Roman church, and the barony is still (1911) in existence. One of the 1st Baron's grandsons was William Petre (1602–1677), who translated the *Flos sanctorum* of Pedro de Ribadeneira as *Lives of the Saints* (St Omer, 1669; London, 1730).

See *Genealogical Collections illustrating the History of Roman Catholic Families of England*, vol. i., edited by J. J. Howard and H. F. Burke.

PETREL, the general name of a group of birds (of which more than 100 species are recognized), derived from the habit which some of them possess of apparently walking on the surface of the water as the apostle St Peter (of whose name the word is a diminutive form) is recorded (Matt. xiv. 29) to have done. The petrels, all of which are placed in the family *Procellariidae*, were formerly associated with the *Laridae* (see GULL), but they are now placed as the sole members of the suborder *Tubinares* (the name denoting the characteristic tubular structure of their nostrils) and of the order *Procellariiformes* (see BIRD). They are subdivided into four groups or subfamilies: (1) *Pelecanoidinae* (or *Halodrominae*), containing some three or four species known as diving-petrels, with habits very different from others of the family, and almost peculiar to high southern latitudes from Cape Horn to New Zealand; (2) *Procellariinae*, or petrels proper (and shearwaters); (3) *Diomedeinae*, or albatrosses (see MALLEMUCK); and (4) *Oceanitinae*, containing small sooty-black birds of the genera *Cymodroma*, *Pealea*, *Pelagodroma*, *Garrodia* and *Oceanites*, the distinctive nature of which was first recognized by Coues in 1864.

Petrels are archaic oceanic forms, with great powers of flight, dispersed throughout all the seas and oceans of the world, and some species apparently never resort to land except for the purpose of nidification, though nearly all are liable at times to be driven ashore, and often very far inland, by gales of wind.[1] It would also seem that during the breeding-season many of them are wholly nocturnal in their habits, passing the day in holes of the ground, or in clefts of the rocks, in which they generally nestle, the hen of each pair laying a single white egg, sparsely speckled in a few species with fine reddish dots. Of those species that frequent the North Atlantic, the common Storm-Petrel, *Procellaria pelagica*, a little bird which has to the ordinary eye rather the look of a Swift or Swallow, is the "Mother Carey's chicken" of sailors, and is widely believed to be the harbinger of bad weather; but seamen hardly discriminate between this and others nearly resembling it in appearance, such as Leach's or the Fork-tailed Petrel, *Cymochorea leucorrhoa*, a rather larger but less common bird, and Wilson's Petrel, *Oceanites oceanicus*, the type of the family *Oceanitidae* mentioned above, which is more common on the American side. But it is in the Southern Ocean that Petrels most abound, both as species and as individuals. The Cape-Pigeon or Pintado Petrel, *Daption capensis*, is one that has long been well known to mariners and other wayfarers on the great waters, while those who voyage to or from Australia, whatever be the route they take, are

[1] Thus *Oestrelata haesitata*, the Capped Petrel, a species whose proper home seems to be Guadeloupe and some of the neighbouring West Indian islands, has occurred in the State of New York, near Boulogne, in Norfolk, and in Hungary (*Ibis*, 1884, p. 202).

certain to meet with many more species, some, as *Ossifraga gigantea*, as large as Albatrosses, and several of them called by sailors by a variety of choice names, generally having reference to the strong smell of musk emitted by the birds, among which that of "Stink-pot" is not the most opprobrious. None of the Petrels are endowed with any brilliant colouring—sooty-black, grey of various tints (one of which is often called "blue"), and white being the only hues the plumage exhibits.

The distribution of the several species of Petrels in the Southern Ocean has been treated by A. Milne-Edwards in the *Annales des sciences naturelles* for 1882 (6th series, *Zoologie*, vol. xiii. art. 4, pp. 1–22). (A. N.)

PETRIE, GEORGE (1790–1866), Irish antiquary, was the son of James Petrie, a native of Aberdeen, who had settled in Dublin as a portrait and miniature painter. He was born in Dublin in January 1790, and was educated as an artist. Besides attaining considerable reputation as a painter of Irish landscape, he devoted much time to the illustration of the antiquities of the country. In 1828 he was appointed to conduct the antiquarian and historical section of the ordnance survey of Ireland. In 1832 he became editor of the *Dublin Penny Journal*, a periodical designed to disseminate information among the masses, to which he contributed numerous articles on the history of the fine arts in Ireland. Petrie may be regarded as the first scientific investigator of Irish archaeology, his contributions to which are also in themselves of much importance. His *Essay on Round Towers*, for which in 1830 he received the prize of the Irish Academy, still ranks as a standard work. Among his other contributions to Irish archaeology are his *Essay on the Military Architecture of Ireland* and his *History and Antiquities of Tara Hill*. He died on the 17th of January 1866.

See the *Life and Labours in Art and Archaeology of George Petrie*, by William Stokes (1868).

PETRIE, WILLIAM MATTHEW FLINDERS (1853–), English egyptologist, was born at Charlton on the 3rd of June 1853, being the son of William Petrie, C.E. His mother was the daughter of Captain Matthew Flinders, the Australian explorer. He took an early interest in archaeological research, and between 1875 and 1880 was busily engaged in studying ancient British remains at Stonehenge and elsewhere; in 1880 he published his book on Stonehenge, with an account of his theories on this subject. He was also much interested in ancient weights and measures, and in 1875 published a work on *Inductive Metrology*. In 1881 he began a long series of important surveys and excavations in Egypt, beginning with the pyramids at Giza, and following up his work there by excavations at the great temple at Tanis (1884), and discovering and exploring the long-lost Greek city of Naucratis in the Delta (1885), and the towns of Am and Daphnae (1886), where he found important remains of the time when they were inhabited by the Pharaohs. Between 1888 and 1890 he was at work in the Fayum, opening up Hawara, Kahun and Lachish; and in 1891 he discovered the ancient temple at Medum. Much of this work was done in connexion with the Palestine Exploration Fund. By this time his reputation was established. He published in 1893 his *Ten Years' Diggings in Egypt*, was given the honorary degree of D.C.L. by Oxford, and was appointed Edwards Professor of Egyptology at University College, London. In 1894 he founded the Egyptian Research Account, which in 1905 was reconstituted as the British School of Archaeology in Egypt (not to be confused with the Egypt Exploration Fund, founded 1892). Perhaps the most important work which the School has accomplished has been the investigation of the site of Memphis (*q.v.*).

The extent as well as the chronological order of Professor Petrie's excavations may best be shown by a list of his works.

WORKS.—His chief general works on Egyptian subjects are: *Ten Years' Diggings in Egypt* (1893); *History of Egypt* (1894–1905); *Egyptian Tales* (1895); *Religion and Conscience in Ancient Egypt* (1898); *Syria and Egypt* (1898); *Royal Tombs of the First Dynasty* (1900); *Royal Tombs of the Earliest Dynasties* (1901); *Hyksos and Israelite Cities* (1906); *Religion of Ancient Egypt* (1906); *Personal Religion in Egypt* (1908). On particular sites, *Pyramids and Temples of Gizeh* (1883); *Tanis I.* (1885); *Naukratis I.* (1886); *Hawara* (1889); *Kahun* (1890); *Illahun* (1891); *Medum* (1892); *Tell el Amarna* (1895); *Koptos* (1896); *Nogada* (1896); *Six Temples at Thebes* (1897); *Deshasheh* (1897); *Dendereh* (1900); *Diospolis* (1901); *Abydos I.* (1902); *Abydos II.* (1903); *Ehnasya* (1904); *Egyptians in Sinai* and *Researches in Sinai* (1906); *Gizeh and Rifeh* (1907); *Athribis* (1908); *Memphis* and *Qurneh* (1909).

PETRIOU (also called *Cha-chang-sao*), a town and port of Siam, in the division of Pachim, about 45 m. E. of Bangkok. It is the centre of that part of southern Siam which is watered by the Bang Pakong River. It is built on low-lying, swampy ground, about 10 m. from the mouth of the above river. The population is about 10,000, mixed Siamese and Chinese, the latter slightly predominating. Rice-mills give employment to a large number of indentured Chinese coolies, but the inhabitants are chiefly engaged in agriculture. A railway connecting with Bangkok was opened in the spring of 1908.

PETROLEA, a town and port of entry in Lambton county, Ontario, Canada, situated 42 m. W. of London on Bear Creek, an affluent of Sydenham River, and on the Grand Trunk and Michigan Central railways. Pop. (1901), 4135. It is in the midst of the oil region of Canada, and numerous wells in the vicinity have an aggregate output of about 30,000,000 gallons of crude oil per annum, much of which is refined in the town.

PETROLEUM (Lat. *petra*, rock, and *oleum*, oil), a term which, in its widest sense, embraces the whole of the hydrocarbons, gaseous, liquid and solid, occurring in nature (see BITUMEN). Here the application of the term is limited to the liquid which is so important an article of commerce, though references will also be made to natural gas which accompanies petroleum. Descriptions of the solid forms will be found in the articles on asphalt or asphaltum, albertite, elaterite, gilsonite, hatchettite and ozokerite. Particulars of the shales which yield oil on destructive distillation are given in the article on paraffin.

Ancient History.—Petroleum was collected for use in the most remote ages of which we have any records. Herodotus describes the oil pits near Ardericca (near Babylon), and the pitch spring of Zacynthus (Zante), whilst Strabo, Dioscorides and Pliny mention the use of the oil of Agrigentum, in Sicily, for illumination, and Plutarch refers to the petroleum found near Ecbatana (Kerkuk). The ancient records of China and Japan are said to contain many allusions to the use of natural gas for lighting and heating. Petroleum ("burning water") was known in Japan in the 7th century, whilst in Europe the gas springs of the north of Italy led to the adoption in 1226 by the municipality of Salsomaggiore of a salamander surrounded by flames as its emblem. Marco Polo refers to the oil springs of Baku towards the end of the 13th century; the medicinal properties of the oil of Tegernsee in Bavaria gave it the name of "St Quirinus's Oil" in 1436; the oil of Pechelbronn, Elsass, was discovered in 1498, and the "earthbalsam" of Galicia was known in 1506. The earliest mention of American petroleum occurs in Sir Walter Raleigh's account of the Trinidad pitch-lake in 1595; whilst thirty-seven years later, the account of a visit of a Franciscan, Joseph de la Roche d'Allion, to the oil springs of New York was published in Sagard's *Histoire du Canada*. In the 17th century, Thomas Shirley brought the natural gas of Wigan, in Shropshire, to the notice of the Royal Society. In 1724 Hermann Boernaave referred to the oleum terrae of Burma, and "Barbados tar" was then well known as a medicinal agent. A Russian traveller, Peter Kalm, in his work on America, published in 1748, showed on a map the oil springs of Pennsylvania, and about the same time Raicevich referred to the "liquid bitumen" of Rumania.

Modern Development and Industrial Progress.—The first commercial exploitation of importance appears to have been the distillation of the oil at Alfreton in Derbyshire by James Young, who patented his process for the manufacture of paraffin in 1850. In 1853 and 1854 patents for the preparation of this substance from petroleum were obtained by Warren de la Rue, and the process was applied to the "Rangoon oil" brought to Great Britain from Yenangyaung in Upper Burma. The active growth of the petroleum industry of the United States began in 1859, though in the early part of the century the petroleum of Lake Seneca, N.Y., was used as an embrocation under the

name of "Seneca oil," and the "American Medicinal Oil" of Kentucky was largely sold after its discovery in 1829. The Pennsylvania Rock Oil Company was formed in 1854, but its operations were unsuccessful, and in 1858 certain of the members founded the Seneca Oil Company, under whose direction E. L. Drake started a well on Oil Creek, Pennsylvania. After drilling had been carried to a depth of 69 feet, on the 28th of August 1859, the tools suddenly dropped into a crevice, and on the following day the well was found to have "struck oil." This well yielded 25 barrels a day for some time, but at the end of the year the output was at the rate of 15 barrels. The production of crude petroleum in the United States was officially reported to have been 2000 barrels in 1859, 4,215,000 barrels in 1869, 19,914,146 barrels in 1879, 35,163,513 barrels in 1889, 57,084,428 barrels in 1899, and 126,493,936 barrels in 1906. From Oil Creek, development spread first over the eastern United States and then became general, subsequently embracing Canada (1862), recently discovered fields being those of Illinois, Alberta and California (44,854,737 barrels in 1908).

For about 10 years Pennsylvania was the one great oil producer of the world, but since 1870 the industry has spread all over the globe. From the time of the completion on the Baku field of the first flowing well (which was unmanageable and resulted in the loss of the greater part of the oil), Russia has ranked second in the list of producing countries, whilst Galicia and Rumania became prominent in 1878 and 1880 respectively. Sumatra, Java and Borneo, where active development began in 1883, 1886 and 1896, bid fair to rank before long among the chief sources of the oil supplies of the world. Similarly, Burma, where the Burmah Oil Company have, since 1890, rapidly extended their operations, is rising to a position of importance. Oil fields are being continually opened up in other parts of the world, and whilst America still maintains her position as the largest petroleum producer, the world's supplies are now being derived from a steadily increasing number of centres.

Physical and Chemical Properties.—Although our information respecting the chemical composition of petroleum has been almost entirely gained since the middle of the 18th century, a considerable amount of empirical knowledge of the substance was possessed by chemists at an earlier date, and there was much speculation as to its origin. In his *Sylva sylvarum* (1627), Francis Bacon states that "the original concretion of bitumen is a mixture of a fiery and watery substance," and observes that flame "attracts" the naphtha of Babylon "afar off." P. J. Macquer (1764), T. O. Bergman (1784), Charles Hatchett (1798) and others also expressed views with regard to the constitution and origin of bitumens. Of these early writers, Hatchett is the most explicit, the various bituminous substances being by him classified and defined. Jacob Joseph Winterl, in 1788, appears to have been the first to examine petroleum chemically, but the earliest systematic investigation was that carried out by Professor B. Silliman, Jun., in 1855, who then reported upon the results which he had obtained with the "rock oil or petroleum" of Venango county, Pennsylvania. This report has become a classic in the literature of petroleum.

The physical properties of petroleum vary greatly. The colour ranges from pale yellow through red and brown to black or greenish, while by reflected light it is, in the majority of cases, of a green hue. The specific gravity of crude petroleum appears to range from ·771 to 1·06, and the flash point from below 0° to 370° F. Viscosity increases with density, but oils of the same density often vary greatly; the coefficient of expansion, on the other hand, varies inversely with the density, but bears no simple relation to the change of fluidity of the oil under the influence of heat, this being most marked in oils of paraffin base. The calorific power of Baku oil appears to be highest, while this oil is poorest in solid hydrocarbons, of which the American petroleums contain moderate quantities, and the Upper Burma oils the largest amount. The boiling point, being determined by the character of the constituents of the oil, necessarily varies greatly in different oils, as do the amounts of distillate obtained from them at specified temperatures.

Even prior to the discovery of petroleum in commercial quantities, a number of chemists had made determinations of the chemical composition of several different varieties, and these investigations, supplemented by those of a later date, show that petroleum consists of about 84% by weight of carbon with 12% of hydrogen, and varying proportions of sulphur, nitrogen and oxygen. The principal elements are found in various combinations, the hydrocarbons of the Pennsylvania oils being mainly paraffins (*q.v.*), while those of Caucasian petroleum belong for the most part to the naphthenes, isomeric with the olefines (*q.v.*).

Paraffins are found in all crude oils, and olefines in varying proportions in the majority, while acetylene has been found in Baku oil; members of the benzene group and its derivatives, notably benzene and toluene, occur in all petroleums. Naphthenes are the chief components of some oils, as already indicated, and occur in varying quantities in many others. Certain crude oils have also been found to contain camphenes, naphthalene and other aromatic hydrocarbons. It is found that transparent oils under the influence of light absorb oxygen, becoming deeper in colour and opalescent, while strong acidity and a penetrating odour are developed, these changes being due to the formation of various acid and phenylated compounds, which are also occasionally found in fresh oils. The residues from petroleum distillation have been shown to contain very dense solids and liquids of high specific gravity, having a large proportion of carbon and possessed of remarkable fluorescent properties.

Natural gas is found to consist mainly of the lower paraffins, with varying quantities of carbon dioxide, carbon monoxide, hydrogen, nitrogen and oxygen, in some cases also sulphuretted hydrogen and possibly ammonia. This mixture dissolves in petroleum, escaping when the oil is stored, and conversely it invariably carries a certain amount of water and oil, which is deposited on compression.

Occurrence.—Bitumen is, in its various forms, one of the most widely-distributed of substances, occurring in strata of every geological age, from the lowest Archean rocks to those now in process of deposition, and in greater or less quantity throughout both hemispheres, from Spitzbergen to New Zealand, and from California to Japan. The occurrence of commercially valuable petroleum is, however, comparatively limited, hitherto exploited deposits being confined to rocks younger than the Cambrian and older than the Quaternary, while the majority of developed oil-fields have been discovered north of the equator.

The main requisites for a productive oil or gas field are a porous reservoir and an impervious cover. Thus, while the mineral may be formed in a stratum other than that in which it is found, though in many cases it is indigenous to it, for the formation of a natural reservoir of the fluid (whether liquid or gas) it is necessary that there should be a suitable porous rock to contain it. Such a rock is typically exemplified by a coarse-grained sandstone or conglomerate, while a limestone may be naturally porous, or, like the Trenton limestone of Ohio and Indiana, rendered so by its conversion into dolomite and the consequent production of cavities due to shrinkage—a change occurring only in the purer limestones. Similarly it is necessary, in view of the hydrostatical relations of water and mineral oils, and the volatile character of the latter, that the porous stratum should be protected from water and air by an overlying shale or other impervious deposit. Water, often saline or sulphurous, is also found in these porous rocks and replaces the oil as the latter is withdrawn.

In addition to these two necessary factors, structural conditions play an important part in determining the accumulation of oil and gas. The main supplies have been obtained from strata unbroken and comparatively undisturbed, but the occurrence of anticlinal or terrace structure, however slightly marked or limited in extent, exerts a powerful influence on the creation of reservoirs of petroleum. These tectonic arches often extend for long distances with great regularity, but are frequently crossed by subsidiary anticlines, which themselves play a not unimportant part in the aggregation of the oil. Owing to difference of density the oil and water in the anticlines separate into two layers, the upper consisting of oil which fills the anticlines, while the water remains in the synclines. Any gas which may be present rises to the summits of the anticlines. When the slow folding of the strata is accompanied by a gradual local descent, a modified or "arrested" anticlinal structure, known as a "terrace" is produced, the upheaving action at that part being sufficient only to arrest the descent which would otherwise occur. The terraces may thus be regarded as flat and extended anticlines. They need not be horizontal, and sometimes have a dip of a few feet per mile, as in the case of the Ohio and Indiana oil fields, where the amount varies from

certain to meet with many more species, some, as *Ossifraga gigantea*, as large as Albatrosses, and several of them called by sailors by a variety of choice names, generally having reference to the strong smell of musk emitted by the birds, among which that of "Stink-pot" is not the most opprobrious. None of the Petrels are endowed with any brilliant colouring—sooty-black, grey of various tints (one of which is often called "blue"), and white being the only hues the plumage exhibits.

The distribution of the several species of Petrels in the Southern Ocean has been treated by A. Milne-Edwards in the *Annales des sciences naturelles* for 1882 (6th series, *Zoologie*, vol. xiii. art. 4, pp. 1–22). (A. N.)

PETRIE, GEORGE (1790–1866), Irish antiquary, was the son of James Petrie, a native of Aberdeen, who had settled in Dublin as a portrait and miniature painter. He was born in Dublin in January 1790, and was educated as an artist. Besides attaining considerable reputation as a painter of Irish landscape, he devoted much time to the illustration of the antiquities of the country. In 1828 he was appointed to conduct the antiquarian and historical section of the ordnance survey of Ireland. In 1832 he became editor of the *Dublin Penny Journal*, a periodical designed to disseminate information among the masses, to which he contributed numerous articles on the history of the fine arts in Ireland. Petrie may be regarded as the first scientific investigator of Irish archaeology, his contributions to which are also in themselves of much importance. His *Essay on Round Towers*, for which in 1830 he received the prize of the Irish Academy, still ranks as a standard work. Among his other contributions to Irish archaeology are his *Essay on the Military Architecture of Ireland* and his *History and Antiquities of Tara Hill*. He died on the 17th of January 1866.

See the *Life and Labours in Art and Archaeology of George Petrie*, by William Stokes (1868).

PETRIE, WILLIAM MATTHEW FLINDERS (1853–), English egyptologist, was born at Charlton on the 3rd of June 1853, being the son of William Petrie, C.E. His mother was the daughter of Captain Matthew Flinders, the Australian explorer. He took an early interest in archaeological research, and between 1875 and 1880 was busily engaged in studying ancient British remains at Stonehenge and elsewhere; in 1880 he published his book on Stonehenge, with an account of his theories on this subject. He was also much interested in ancient weights and measures, and in 1875 published a work on *Inductive Metrology*. In 1881 he began a long series of important surveys and excavations in Egypt, beginning with the pyramids at Giza, and following up his work there by excavations at the great temple at Tanis (1884), and discovering and exploring the long-lost Greek city of Naucratis in the Delta (1885), and the towns of Am and Daphnae (1886), where he found important remains of the time when they were inhabited by the Pharaohs. Between 1888 and 1890 he was at work in the Fayum, opening up Hawara, Kahun and Lachish; and in 1891 he discovered the ancient temple at Medum. Much of this work was done in connexion with the Palestine Exploration Fund. By this time his reputation was established. He published in 1893 his *Ten Years' Diggings in Egypt*, was given the honorary degree of D.C.L. by Oxford, and was appointed Edwards Professor of Egyptology at University College, London. In 1894 he founded the Egyptian Research Account, which in 1905 was reconstituted as the British School of Archaeology in Egypt (not to be confused with the Egypt Exploration Fund, founded 1892). Perhaps the most important work which the School has accomplished has been the investigation of the site of Memphis (*q.v.*).

The extent as well as the chronological order of Professor Petrie's excavations may best be shown by a list of his works.

WORKS.—His chief general works on Egyptian subjects are: *Ten Years' Diggings in Egypt* (1893); *History of Egypt* (1894–1905); *Egyptian Tales* (1895); *Religion and Conscience in Ancient Egypt* (1898); *Syria and Egypt* (1898); *Royal Tombs of the First Dynasty* (1900); *Royal Tombs of the Earliest Dynasties* (1901); *Hyksos and Israelite Cities* (1906); *Religion of Ancient Egypt* (1906); *Personal Religion in Egypt* (1908). On particular sites, *Pyramids and Temples of Gizeh* (1883); *Tanis I.* (1885); *Naukratis I.* (1886); *Hawara* (1889); *Kahun* (1890); *Illahun* (1891); *Medum* (1892); *Tell el Amarna* (1895); *Koptos* (1896); *Nogada* (1896); *Six Temples at Thebes* (1897); *Deshasheh* (1897); *Dendereh* (1900); *Diospolis* (1901); *Abydos I.* (1902); *Abydos II.* (1903); *Ehnasya* (1904); *Egyptians in Sinai* and *Researches in Sinai* (1906); *Gizeh and Rifeh* (1907); *Athribis* (1908); *Memphis* and *Qurneh* (1909).

PETRIOU (also called *Cha-chang-sao*), a town and port of Siam, in the division of Pachim, about 45 m. E. of Bangkok. It is the centre of that part of southern Siam which is watered by the Bang Pakong River. It is built on low-lying, swampy ground, about 10 m. from the mouth of the above river. The population is about 10,000, mixed Siamese and Chinese, the latter slightly predominating. Rice-mills give employment to a large number of indentured Chinese coolies, but the inhabitants are chiefly engaged in agriculture. A railway connecting with Bangkok was opened in the spring of 1908.

PETROLEA, a town and port of entry in Lambton county, Ontario, Canada, situated 42 m. W. of London on Bear Creek, an affluent of Sydenham River, and on the Grand Trunk and Michigan Central railways. Pop. (1901), 4135. It is in the midst of the oil region of Canada, and numerous wells in the vicinity have an aggregate output of about 30,000,000 gallons of crude oil per annum, much of which is refined in the town.

PETROLEUM (Lat. *petra*, rock, and *oleum*, oil), a term which, in its widest sense, embraces the whole of the hydrocarbons, gaseous, liquid and solid, occurring in nature (see BITUMEN). Here the application of the term is limited to the liquid which is so important an article of commerce, though references will also be made to natural gas which accompanies petroleum. Descriptions of the solid forms will be found in the articles on asphalt or asphaltum, albertite, elaterite, gilsonite, hatchettite and ozokerite. Particulars of the shales which yield oil on destructive distillation are given in the article on paraffin.

Ancient History.—Petroleum was collected for use in the most remote ages of which we have any records. Herodotus describes the oil pits near Ardericca (near Babylon), and the pitch spring of Zacynthus (Zante), whilst Strabo, Dioscorides and Pliny mention the use of the oil of Agrigentum, in Sicily, for illumination, and Plutarch refers to the petroleum found near Ecbatana (Kerkuk). The ancient records of China and Japan are said to contain many allusions to the use of natural gas for lighting and heating. Petroleum ("burning water") was known in Japan in the 7th century, whilst in Europe the gas springs of the north of Italy led to the adoption in 1226 by the municipality of Salsomaggiore of a salamander surrounded by flames as its emblem. Marco Polo refers to the oil springs of Baku towards the end of the 13th century; the medicinal properties of the oil of Tegernsee in Bavaria gave it the name of "St Quirinus's Oil" in 1436; the oil of Pechelbronn, Elsass, was discovered in 1498, and the "earthbalsam" of Galicia was known in 1506. The earliest mention of American petroleum occurs in Sir Walter Raleigh's account of the Trinidad pitch-lake in 1595; whilst thirty-seven years later, the account of a visit of a Franciscan, Joseph de la Roche d'Allion, to the oil springs of New York was published in Sagard's *Histoire du Canada*. In the 17th century, Thomas Shirley brought the natural gas of Wigan, in Shropshire, to the notice of the Royal Society. In 1724 Hermann Boernaave referred to the oleum terrae of Burma, and "Barbados tar" was then well known as a medicinal agent. A Russian traveller, Peter Kalm, in his work on America, published in 1748, showed on a map the oil springs of Pennsylvania, and about the same time Raicevich referred to the "liquid bitumen" of Rumania.

Modern Development and Industrial Progress.—The first commercial exploitation of importance appears to have been the distillation of the oil at Alfreton in Derbyshire by James Young, who patented his process for the manufacture of paraffin in 1850. In 1853 and 1854 patents for the preparation of this substance from petroleum were obtained by Warren de la Rue, and the process was applied to the "Rangoon oil" brought to Great Britain from Yenangyaung in Upper Burma. The active growth of the petroleum industry of the United States began in 1859, though in the early part of the century the petroleum of Lake Seneca, N.Y., was used as an embrocation under the

Extraction (*Technically termed Production*). —The earliest system adopted for the collection of petroleum appears to have consisted in skimming the oil from the surface of the water upon which it had accumulated, and Professor Lesley states that at Paint Creek, in Johnson county, Kentucky, a Mr George and others were in the habit of collecting oil from the sands, "by making shallow canals 100 or 200 ft. long, with an upright board and a reservoir at one end, from which they obtained as much as 200 barrels per year by stirring the sands with a pole." It is said that at Echigo in Japan, old wells, supposed to have been dug several hundred years ago, are existent, and that a Japanese history—called *Kokushiriyaku*, states that "burning water" was obtained in Echigo about A.D. 615.

Early Methods.

The petroleum industry in the United States may be considered to date from the year 1859, when the first well avowedly drilled for the production of oil was completed by E. L. Drake. The present method of drilling has been evolved from the artesian well system previously adopted for obtaining brine and water. The drilling of petroleum wells is carried on by individuals or companies, either on lands owned by them, or on properties whose owners grant leases, usually on condition that a certain number of wells shall be sunk within a stated period, and that a portion of the oil obtained (usually from one-tenth to one-fourth) shall be appropriated as royalty to the lessor. Such leases are often transferred at a larger royalty, especially after the territory has been proved productive. The "wild-cat" wells, sunk by speculators on untested territory or on lands which had not previously proved productive, played an important part in the earlier mapping out of the petroleum fields. To discourage the sinking of wells on land immediately adjoining productive territory, it has been usual to drill along the borders of the land as far as practicable, in order to first obtain the oil which might otherwise be raised by others; and on account of the small area often controlled by the operator, the number of wells drilled has frequently been far in excess of the number which might reasonably be sunk. Experience has proved that in some of the oil fields of the United States one well to five acres is as close as they should be drilled.

The United States.

After the selection of the site, the first operation consists in the erection of the rig. The chief portion of this rig is the derrick, which consists of four strong uprights or legs held in position by ties and braces, and resting on strong wooden sills, which are preferred, as a foundation, to masonry. For drilling the deeper wells, the derrick, on account of the length of the "string" of drilling tools, is usually at least 70 ft. high, about 20 ft. wide at the base, and 4 ft. wide at the summit. The whole derrick is set up by keys, no mortises or tenons being used, and thus the complete rig may be readily taken down and set up on a new site. The samson-post, which supports the walking beam, and the jack-posts, are dove-tailed and keyed into the sills. The samson-post is placed flush with one side of the main sill, the band-wheel jack-post being flush with the other side, so that the walking-beam, which imparts motion to the string of tools, works parallel with the main sill.

Oil Derrick.

The boiler generally used is of the locomotive type and is usually stationary, though sometimes a portable form is preferred. It is either set in the first instance at some distance from the engine and well, or is subsequently removed sufficiently far away before the drill enters the oil-bearing formation, and until the oil and gas are under control, in order to minimize the risk of fire. A large boiler frequently supplies the engines of several wells. The engine, which is provided with reversing gear, is of 12 or 15 horse-power and motion is communicated through a belt to the band-wheel, which operates the walking-beam by means of a crank. The throttle-valve is opened or closed by turning a grooved vertical pulley by means of an endless cord, called the telegraph, passing round another pulley fixed upon the "headache-post," and is thus under the control of the driller working in the derrick. The headache-post is a vertical wooden beam placed on the main sill directly below the walking-beam, to receive the weight of the latter in case of breakage of connexions. The position of the reversing link is altered by means of a cord, passing over two pulleys, fixed respectively in the engine-house and on the derrick. At one end of the band-wheel shaft is the bull-rope pulley, and upon the other end is a crank having six holes to receive a movable wrist-pin, the length of stroke of the walking-beam being thus adjusted. The revolution of the bull-wheels is checked by the use of a powerful hand-brake.

The band-wheel communicates motion to the walking-beam, while drilling is in progress, through the crank and a connecting-rod known as the pitman; to the bull-wheels, while the tools are being raised, by the bull-rope; and to the sand-pump reel, by a friction pulley, while the sand-pump is being used. It is therefore necessary that the machinery should be so arranged that the connexions may be rapidly made and broken. The sand-pump reel is set in motion by pressing a lever, the reel being then brought into contact with the face of the band-wheel. The sand-pump descends by gravitation, and its fall is checked by pressing back the lever, so as to throw the reel against a post which serves as a brake.

The drilling tools are suspended by an untarred manila rope, 2 in. in diameter, passing from the bull-wheel shaft over a grooved wheel known as the crown-pulley, at the summit of the derrick. The string of drilling tools consists of two parts separated by an appliance known as the jars. This piece of apparatus was introduced by William Morris in 1831, and consists of a long double link with closely-fitting jaws which, however, slide freely up and down. It may be compared to a couple of elongated and flattened links of chain. The links are about 30 in. long and are interposed between the heavy iron auger-stem carrying the bit and the upper rod, known as the sinker-bar. Their principal use is to give a sharp jar to the drill on the up-stroke so that the bit is dislodged if it has become jammed in the rock. In addition to the appliances mentioned the tools comprise reamers to enlarge the bore of the well, the winged-substitute which is fitted above the bit to prevent it from glancing off, and above the round reamer to keep it in place, a temper-screw with clamps and wrenches. Sand-pumps and bailers are also required to remove detritus, water and oil from the bore-hole.

Drilling Tools.

The action of the jars and temper-screw has been described by John F. Carll as follows: "Suppose the tools to have been just run to the bottom of the well, the jars closed and the cable slack. The men now take hold of the bull-wheels and draw up the slack until the sinker-bar rises, the 'play' of the jars allowing it to come up 13 in. without disturbing the auger-stem. When the jars come together they slack back about 4 in., and the cable is in position to be clamped in the temper-screw. If now the vertical movement of the walking-beam be 24 in., when it starts on the up-stroke the sinker-bar rises 4 in., and the cross-heads come together with a smart blow, then the auger-stem is picked up and lifted 20 in. On the down-stroke, the auger-stem falls 20 in., while the sinker-bar goes down 24 in. to telescope the jars for the next blow coming up. A skilful driller never allows his jars to strike on the down-stroke, they are only used to jar down when the tools stick on some obstruction in the well before reaching the bottom, and in fishing operations. An unskilful workman sometimes 'loses the jar' and works for hours without accomplishing anything. The tools may be standing at the bottom while he is playing with the slack of the cable or they may be swinging all the time several feet from the bottom. As the jar works off, or grows more feeble, by reason of the downward advance of the drill, it is 'tempered' to the proper strength by letting down the temper-screw to give the jars more play. The temper-screw forms the connecting link between the walking-beam and cable, and it is 'let out' gradually to regulate the play of the jars as fast as the drill penetrates. When its whole length is run down, the rope clamps play very near the well-mouth. The tools are then withdrawn, the well is sand-pumped, and preparations are made for the next 'run.'"

The ordinary sand-pump or bailer, consists of a plain cylinder of light galvanized iron with a bail at the top and a stem-valve at the bottom. It is usually about 6 ft. in length but is sometimes as much as 15 or 20 ft., and as its valve-stem projects downwards beyond the bottom, it empties itself when rested upon the bottom of the waste-trough.

The operation of drilling is frequently interrupted by the occurrence of an accident, which necessitates the use of fishing tools. If the fishing operation is unsuccessful the well has to be abandoned, often after months of labour, unless it is found possible to drill past the tools which have been lost. In readiness for a fracture of the drilling tools or of the cable, special appliances known as fishing tools are provided. These are so numerous and varied in form that a description would be impossible within the scope of this article. The fishing tools are generally attached to the cable, and are used with portions of the ordinary string of tools, but some are fitted to pump-rods or tubing, and others to special rods.

The drilling of a well is commonly carried out under contract, the producer erecting the derrick and providing the engine and boiler while the drilling contractor finds the tools, and is responsible for accidents or failure to complete the well. The drilling "crew" consists of two drillers and two tool-dressers, working in pairs in two "tours" (noon to midnight and midnight to noon).

Drilling the Well.

The earlier wells in Pennsylvania consisted of three sections, the first formed of surface clays and gravels, the second of stratified rocks containing water, and the third of stratified rocks, including the oil-sands, usually free from water. The conductor, which was a wooden casing of somewhat greater internal diameter than the maximum bore of the well, passed through the first of these divisions, and casing was used in the second to prevent percolation of water into the oil-bearing portion. In later wells the conductor has been replaced with an 8-in. wrought-iron drive-pipe, terminating in a steel shoe, which is driven to the bed-rock, and a 7¼-in. hole is drilled below it to the base of the lowest water-bearing stratum. The bore is then reduced to 5⅝-in., and a bevelled shoulder being made in the rock, a 5⅝-in. casing, having a collar to fit water-tight on the bevel shoulder, is inserted. The well is then completed with a 5½-in. bit. As the water is shut off before the portion of the well below the water-bearing strata is bored the remainder of the drilling is conducted with only sufficient water in the well to

admit of sand pumping. The drill is thus allowed to fall freely, instead of being partly upheld by the buoyancy of the water, as in earlier wells.

Wells in Pennsylvania now range in depth from 300 ft. to 3700 ft. Four strings of iron casing are usually employed, having the following diameters: 10 in., $8\frac{1}{4}$ in., $6\frac{5}{8}$ in. and 5 in., the lengths of tube forming the casing being screwed together. Contractors will often undertake to drill wells of moderate depth at 90 cents to $1 per ft., but the cost of a deep well may amount to as much as $7000.

Rotary System.

The rotary system of drilling which is in general use in the oil-fields of the coastal plain of Texas is a modification of that invented by Fauvelle in 1845, and used in the early years of the industry in some of the oil-producing countries of Europe. It is one of the most rapid and economical which can be employed in soft formations, but where hard rock is encountered it is almost useless. The principle of this system consists essentially in the use of rotating hollow drilling rods or casing, to which is attached the drilling-bit and through which a continuous stream of water, under a pressure of 40 to 100 lb per sq. in., is forced.

Yield of Wells.

The yield of petroleum wells varies within very wide limits, and the relative importance of the different producing districts is also constantly changing. I. C. White, state geologist of West Virginia, estimates that in fairly good producing sand a cubic foot of rock contains from 6 to 12 pints of oil. He assumes that in what is considered a good producing district the amount of petroleum which can be obtained from a cubic foot of rock would not be more than a gallon, and that the average thickness of the oil-bearing rock would not exceed 5 ft. Taking these figures as a basis, the total yield of oil from an acre of petroliferous territory would be a little over 5000 barrels of 42 U.S. gallons.

A flow of oil may often be induced in a well which would otherwise require to be pumped, by preventing the escape of gas which issues with the oil, and causing its pressure to raise the oil. The device employed for this purpose is known as the water-packer, and consists in its simplest form of an india-rubber ring, which is applied between the tubing and the well-casing, so that upon compression it makes a tight joint. The gas thus confined in the oil-chamber forces the oil up the tubing.

For pumping a well a valved working-barrel with valved sucker is attached to the lower end of the tubing, a perforated "anchor" being placed below. The sucker carries a series of three or four leather cups, which are pressed against the inner surface of the working barrel by the weight of the column of oil. The sucker is connected by a string of sucker-rods with the walking-beam. There is usually fixed above the sucker a short iron valve-rod, with a device known as a rivet-catcher to prevent damage to the pump by the dropping of rivets from the pump-rods.

Torpedoing Wells.

On the completion of drilling, or when the production is found to decrease, it is usual to torpedo the well to increase the flow. The explosive employed is generally nitroglycerin, and the amount used has been increased from the original 4 to 6 quarts to 60, 80, 100 and even 200 quarts. It is placed in tin canisters of about $3\frac{1}{2}$ to 5 in. in diameter and about 10 ft. in length. The canisters have conical bottoms and fit one in the other. They are consecutively filled with nitroglycerin, and are lowered to the bottom of the well, one after the other, by a cord wound upon a reel, until the required number have been inserted. Formerly the upper end of the highest canister was fitted with a "firing-head," consisting of a circular plate of iron, slightly smaller than the bore of the well, and having attached to its underside a vertical rod or pin carrying a percussion cap. The cap rested on the bottom of a small iron cylinder containing nitroglycerin. To explode the charge an iron weight, known as a go-devil, was dropped into the well, and striking the disk exploded the cap and fired the torpedo. Now, however, a miniature torpedo known as a go-devil squib, holding about a quart of nitroglycerin, and having a firing-head similar to that already described, is almost invariably employed. The disk is dispensed with, and the percussion cap is exploded by the impact of a leaden weight running on a cord. The squib is lowered after the torpedo, and, when exploded by the descent of the weight, fires the charge. It must be borne in mind that although the explosion may increase the production for a time, it is by no means certain that the actual output of a well is increased in all such cases, though from some wells there would be no production without the use of the torpedo.

Drilling in Canada.

The petroleum industry in Canada is mainly concentrated in the district of Petrolea, Ontario. On account of the small depth of the wells, and the tenacious nature of the principal strata bored through, the Canadian method of drilling differs from the Pennsylvanian or American system in the following particulars:—

1. The use of slender wooden boring-rods instead of a cable.
2. The employment of a simple auger instead of a spudding-bit.
3. The adoption of a different arrangement for transmitting motion.
4. The use of a lighter set of drilling tools.

Drilling in Russia.

Although petroleum wells in Russia have not the depth of many of those in the United States, the disturbed character of the strata, with consequent liability to caving, and the occurrence of hard concretions, render drilling a lengthy and expensive operation. It is usual to begin by making an excavation 8 ft. in diameter and 24 ft. in depth, and lining the sides of this with wood or brick. The initial diameter of the well drilled from the bottom of this pit is in some instances as much as 30 in., bore-holes of the larger size being preferred, as they are less liable to become choked, and admit of the use of larger bailers for raising the oil.

The drilling of wells of large size requires the use of heavy tools and of very strong appliances generally. The system usually adopted is a modification of the Canadian system already described, the boring rods being, however, of iron instead of wood, but the cable system has also to some extent been used. For the ordinary 2-in. plain-laid manila cable a wire rope has in some cases been successfully substituted.

Riveted iron casing, made of $\frac{3}{16}$-in. plate, is employed, and is constantly lowered so as to follow the drill closely, in order to prevent caving. Within recent years, owing to the initiative of Colonel English, a method of raising oil by the agency of compressed air has been introduced into the Baku oil-fields.

Drilling in Galicia.

In Galicia the Canadian system is nearly exclusively adopted. In some instances under-reaming is found necessary. This consists in the use of an expanding reamer by means of which the well may be drilled to a diameter admitting of the casing descending freely, which obviously could not be accomplished with an ordinary bit introduced through the casing. Of late years the under-reamer has been largely superseded by the eccentric bit.

The Calyx Drill.

The Davis calyx drill has also been employed for petroleum drilling. This apparatus may be described as a steel-pointed core-drill. The bit or cutter consists of a cylindrical metallic shell, the lower end of which is made, by a process of gulleting, into a series of sharp teeth, which are set in and out alternately. The outward set of teeth drill the hole large enough to permit the drilling apparatus to descend freely, and the teeth set inwardly pare down the core to such a diameter as will admit of the body of the cutter passing over it without seizing. The calyx is a long tube, or a series of connected tubes, situated above the core barrel, to which it is equal in diameter.

Comparison of Systems.

In conclusion it may be stated that the two systems of drilling for petroleum with which by far the largest amount of work has been, and is being done, are the American or rope system, and the Canadian or rod system. The former is not only employed in the United States, but is in use in Upper Burma, Java, Rumania and elsewhere. The latter was introduced by Canadians into Galicia and, with certain modifications, has hitherto been found to be the best for that country. A form of the rod system is used in the Russian oil-fields, but owing to the large diameter of the wells the appliances differ from those employed elsewhere.

The wells from which the supplies of natural gas are obtained in the United States are drilled and cased in the same manner as the oil wells.

Transport and Storage.—In the early days of the petroleum industry the oil was transported in the most primitive manner. Thus, in Upper Burma, it was conveyed in earthenware vessels from the wells to the river bank, where it was poured into the holds of boats. It is interesting to find that a rude pipe-line formerly existed in this field for conveying the crude oil from the wells to the river; this was made of bamboos, but it is said that the loss by leakage was so great as to lead to its immediate abandonment on completion. In Russia, until 1875, the crude oil was carried in barrels on Persian carts known as "arbas." These have two wheels of $8\frac{1}{2}$ to 9 ft. in diameter, the body carrying one barrel, while another is slung beneath the axle. In America, crude petroleum was at first transported in iron-hooped barrels, holding from 40 to 42 American gallons, which were carried by teamsters to Oil Creek and the Allegheny River, where they were loaded on boats, these being floated down stream whenever sufficient water was present—a method leading to much loss by collision and grounding. Bulk barges were soon introduced on the larger rivers, but the use of these was partially rendered unnecessary by the introduction of railways, when the oil was at first transported in barrels on freight cars, but later in tank-cars. These at first consisted of an ordinary truck on which were placed two wooden tub-like tanks, each holding about 2000 gallons; they were replaced in 1871 by the modern type of tank-car, constructed with a horizontal cylindrical tank of boiler plate.

The means of transporting petroleum in bulk commonly used at the present day is the pipe-line system, the history of which dates from 1860. In that year S. D. Karns suggested laying a 6-in. pipe from Burning Springs to Parkersburg, West Virginia, a distance of 36 m.; but his proposal was never carried into effect. Two years later, however, L. Hutchinson of New York, laid a short line from the Tarr Farm wells to the refinery, which passed over a hill, the oil being moved on the syphon principle, and a year later constructed another three miles long to the railway. These attempts were, however, unsuccessful, on account of the excessive leakage

at the joints of the pipes. With the adoption of carefully fitted screw-joints in 1865 the pipe line gradually came into general use, until in 1891 the lines owned by the various transit companies of Pennsylvania amounted in length to 25,000 m.

The pumps employed to force the oil through the pipes were at first of the single-cylinder or "donkey" type, but these were found to cause excessive wear—a defect remedied by the use of the Worthington pump now generally adopted. The engines used on the main 6-in. lines are of 600 to 800 h.p., while those on the small-diameter local lines range from 25 to 30 h.p.

Tanks of various types are employed in storing the oil, those at the wells being circular and usually made of wood, with a content of 250 barrels and upwards. Large tanks of boiler-plate are used to receive the oil as it comes through the pipe-lines. Those adopted by the National Transit Company are 90 ft. in diameter and 30 ft. high, with slightly conical wooden roofs covered with sheet iron; their capacity is 35,000 barrels, and they are placed upon the carefully levelled ground without any foundation.

Kerosene is transported in bulk by various means; specially constructed steel tank barges are used on the waterways of the United States, tank-cars on the railroads, and tank-wagons on the roads. The barrels employed in the transport of petroleum products are made of well-seasoned white-oak staves bound by six or eight iron hoops. They are coated internally with glue, and painted in the well-known colours, blue staves and white heads. The tins largely used for kerosene are made by machinery and contain 5 American gallons. They are hermetically sealed for transport.

In Canada, means of transport similar to those already described are employed, but the reservoirs for storage often consist of excavations in the soft Erie clay of the oil district, the sides of which are supported by planks.

The primitive methods originally in use in the Russian oil-fields have already been described; but these were long ago superseded by pipe-lines, while a great deal of oil is carried by tank steamers on the Caspian to the mouth of the Volga where it is transferred to barges and thence at Tzaritzin to railway tank-cars. The American type of storage-tank is generally employed, in conjunction with clay-lined reservoirs.

Natural gas is largely used in the United States, and for some time, owing to defective methods of storage, delivery and consumption, great waste occurred. The improvements introduced in 1890 and 1891, whereby this state of affairs was put an end to, consisted in the introduction of the principle of supply by meter, and the adoption of a comprehensive system of reducing the initial pressure of the gas, so as to diminish loss by leakage. For the latter purpose, Westinghouse gas-regulators are employed, the positions of the regulators being so chosen as to equalize the pressure throughout the service. The gas is distributed to the consumer from the wells in wrought-iron pipes, ranging in diameter from 20 in. down to 2 in. Riveted wrought-iron pipes 3 ft. in diameter are also used. The initial pressure is sometimes as high as 400 ℔ to the sq. in., but usually ranges from 200 to 300 ℔. The most common method of distribution in cities and towns is by a series of pipes from 12 in. down to 2 in. in diameter, usually carrying a pressure of about 4 oz. to the sq. in. To these pipes the service-pipes leading into the houses of the consumers are connected.

Refining of Petroleum.—The distillation of petroleum, especially of such as was intended for medicinal use, was regularly carried on in the 18th century, and earlier. V. I. Ragozin states in his work on the petroleum industry that Johann Lerche, who visited the Caspian district in 1735, found that the crude Caucasian oil required to be distilled to render it satisfactorily combustible, and that, when distilled, it yielded a bright yellow oil resembling a spirit, which readily ignited. As early as 1823 the brothers Dubinin erected a refinery in the village of Mosdok, and in 1846 applied to Prince Woronzoff for a subsidy for extending the use of petroleum distillates in the Caucasus. In their application, which was unsuccessful, they stated that they had taught the Don Cossacks to "change black naphtha into white," and showed by a drawing, preserved in the archives of the Caucasian government, how this was achieved. They used an iron still, set in brickwork, and from a working charge of forty "buckets" of crude petroleum obtained a yield of sixteen "buckets" of "white naphtha." The top of the still had a removable head, connected with a condenser consisting of a copper worm in a barrel of water. The "white naphtha" was sold at Nizhniy Novgorod without further treatment.

Some of the more viscous crude oils obtained in the United States are employed as lubricants under the name of "natural oils," either without any treatment or after clarification by subsidence and filtration through animal charcoal. Others are deprived of a part of their more volatile constituents by spontaneous evaporation, or by distillation, *in vacuo* or otherwise, at the lowest possible temperature. Such are known as "reduced oils."

In most petroleum-producing countries, however, and particularly where the product is abundant, the crude oil is fractionally distilled, so as to separate it into petroleum spirit of various grades, burning oils, gas oils, lubricating oils, and (if the crude oil yields that product) paraffin. The distillates obtained are usually purified by treatment, successively, with sulphuric acid and solution of caustic soda, followed by washing with water.

Crude petroleum was experimentally distilled in the United States in 1833 by Professor Silliman (d. 1864), and the refining of petroleum in that country may be said to date from about the year 1855, when Samuel M. Kier fitted up a small refinery with a 5-barrel still, for the treatment of the oil obtained from his father's salt-wells. At this period the supply of the raw material was insufficient to admit of any important development in the industry, and before the drilling of artesian wells for petroleum was initiated by Drake the "coal-oil" or shale-oil industry had assumed considerable proportions in the United States. Two large refineries, one on Newtown Creek, Long Island, and another in South Brooklyn, also on Long Island, were in successful operation when the abundant production of petroleum, which immediately followed the completion of the Drake well, placed at the disposal of the refiner a material which could be worked more profitably than bituminous shale. The existing refineries were accordingly altered so as to adapt them for the refining of petroleum; but in the manufacture of burning oil from petroleum the small stills which had been in use in the distillation of shale-oil were at first employed.

In the earlier refineries the stills, the capacity of which varied from 25 to 80 barrels, usually consisted of a vertical cylinder, constructed of cast- or wrought-iron, with a boiler-plate bottom and a cast-iron dome, on which the "goose-neck" was bolted. The charge was distilled almost to dryness, though the operation was not carried far enough to cause the residue to "coke." The operation was, however, completely revolutionized in the United States by the introduction of the "cracking process," and by the division of the distillation into two parts, one consisting in the removal of the more volatile constituents of the oil, and the other in the distillation (which is usually conducted in separate stills) of the residues from the first distillation, for the production of lubricating oils and paraffin.

Various arrangements have been proposed and patented for the continuous distillation of petroleum, in which crude oil is supplied to a range of stills as fast as the distillates pass off. The system is largely employed in Russia, and its use has been frequently attempted in the United States, but the results have not been satisfactory, on account, it is said, of the much greater quantity of dissolved gas contained in the American oil, the larger proportion of kerosene which such oil yields, and the less fluid character of the residue.

In the United States a horizontal cylindrical still is usually employed in the distillation of the spirit and kerosene, but what is known as the "cheese-box" still has also been largely used. American stills of the former type are constructed of wrought-iron or steel, and are about 30 ft. in length by 12 ft. 6 in. in diameter, with a dome about 3 ft. in diameter, furnished with a vapour-pipe 15 in. in diameter. The charge for such a still is about 600 barrels. The stills were formerly completely bricked in, so that the vapours should be kept fully heated until they escaped to the condenser, but since the introduction of the "cracking process," the upper part has usually been left exposed to the air. The cheese-box still has a vertical cylindrical body, which may be as much as 30 ft. in diameter and 9 ft. in depth, connected by means of three vertical pipes with a vapour-chest furnished with a large number, frequently as many as forty, of 3-in. discharge-pipes arranged in parallel lines.

The stills employed in Russia and Galicia are usually smaller than those already described.

The "cracking" process, whereby a considerable quantity of the oil which is intermediate between kerosene and lubricating oil is converted into hydrocarbons of lower specific gravity and boiling-point suitable for illuminating purposes, is one of great scientific and technical interest. It is generally understood that the products of fractional distillation, even in the laboratory, are not identical with the hydrocarbons present in the crude oil, but are in part produced by the action of heat upon them. This was plainly stated by Professor Silliman in the earliest stages of development of the American petroleum industry. An important paper bearing on the subject was published in 1871, by T. E. Thorpe and J. Young, as a preliminary note on their experiments on the action of heat under pressure on solid paraffin. They found that the paraffin was thus converted, with the evolution of but little gas, into hydrocarbons which were liquid at ordinary temperatures. In an experiment on 3500 grams of paraffin produced from shale (melting point 44·5° C.) they obtained nearly 4 litres of liquid hydrocarbons, which they subjected to fractional distillation, and on examining the fraction distilling below 100° C., they found it to consist mainly of olefines. The hydrocarbon $C_{20}H_{42}$, for example, might be resolved into $C_5H_{12} + C_{15}H_{30}$, or $C_6H_{14} + C_{14}H_{28}$, or $C_7H_{16} + C_{13}H_{26}$, &c., the general equation of the decomposition being—

$$C_n H_{2n+2} \text{ (paraffin)} = C_{n-p} H_{2(n-p)+2} \text{ (paraffin)} + C_p H_{2p} \text{ (olefine)}.$$

The product actually obtained is a mixture of several paraffins and several olefines.

The cracking process practically consists in distilling the oils at a temperature higher than the normal boiling point of the constituents which it is desired to decompose. This may be brought about by a distillation under pressure, or by allowing the condensed distillate to fall into the highly heated residue in the still. The result of this treatment is that the comparatively heavy oils

undergo dissociation, as shown by the experiments of Thorpe and Young, into specifically lighter hydrocarbons of lower boiling points, and the yield of kerosene from ordinary crude petroleum may thus be greatly increased. A large number of arrangements for carrying out the cracking process have been proposed and patented, probably the earliest directly bearing on the subject being that of James Young, who in 1865 patented his "Improvements in treating hydrocarbon oils." In this patent, the distillation is described as being conducted in a vessel having a loaded valve or a partially closed stop-cock, through which the confined vapour escapes under any desired pressure. Under such conditions, distillation takes place at higher temperatures than the normal boiling-points of the constituent hydrocarbons of the oil, and a partial cracking results. The process patented by Dewar and Redwood in 1889 consists in the use of a suitable still and condenser in free communication with each other—*i.e.* without any valve between them—the space in the still and condenser not occupied by liquid being charged with air, carbon dioxide or other gas, under the required pressure, and the condenser being provided with a regulated outlet for condensed liquid. An objectionable feature of the system of allowing the vapour to escape from the still to the condenser through a loaded valve—viz. the irregularity of the distillation—is thus removed, and the benefits of regular vaporization and condensation under high pressure are obtained. In the American petroleum refineries it is found that sufficient cracking can be produced by slow distillation in stills of which the upper part is sufficiently cool to allow of the condensation of the vapours of the less volatile hydrocarbons, the condensed liquid thus falling back into the heated body of oil.

In the earlier stages of the development of the manufacture of mineral lubricating oils, the residues were distilled in cast-iron stills, and the lubricating properties of the products thus obtained were injured by overheating. The modern practice is to employ horizontal cylindrical wrought-iron or steel stills, and to introduce steam into the oil. The steam is superheated and may thus be heated to any desired temperature without increase of pressure, which would be liable to damage the still. The steam operates by carrying the vapours away to the condenser as fast as they are generated, the injury to the products resulting from their remaining in contact with the highly heated surface of the still being thus prevented.

In order to separate the distillate into various fractions, and to remove as much of it as possible free from condensed steam, it is now usual to employ condensing appliances of special form with outlets for running off the different fractions.

The process of distillation of lubricating oils under reduced atmospheric pressure is now in very general use, especially for obtaining the heavier products. The vapours from the still pass through a condenser into a receiver, which is in communication with the exhauster.

The products obtained by the distillation of petroleum are not in a marketable condition, but require chemical treatment to remove acid and other bodies which impart a dark colour as well as an unpleasant odour to the liquid, and in the case of lamp-oils, reduce the power of rising in the wick by capillary attraction.

At the inception of the industry kerosene came into the market as a dark yellow or reddish-coloured liquid, and in the first instance, the removal of colour was attempted by treatment with soda lye and lime solution. It was, however, found that after the oil so purified had been burned in a lamp, for a short time, the wick became encrusted, and the oil failed to rise properly. Eichler, of Baku, is stated to have been the first to introduce, in Russia, the use of sulphuric acid, followed by that of soda lye, and his process is in universal use at the present time. The rationale of this treatment is not fully understood, but the action appears to consist in the separation or decomposition of the aromatic hydrocarbons, fatty and other acids, phenols, tarry bodies, &c., which lower the quality of the oil, the sulphuric acid removing some, while the caustic soda takes out the remainder, and neutralizes the acid which has been left in the oil. This treatment with acid and alkali is usually effected by agitation with compressed air. Oils which contain sulphur compounds are subjected to a special process of refining in which cupric oxide or litharge is employed as a desulphurizing agent.

Testing.—A large number of physical and chemical tests are applied both to crude petroleum and to the products manufactured therefrom. The industry is conducted upon a basis of recognized standards of quality, and testing is necessary in the interests of both refiner and consumer, as well as compulsory in connexion with the various statutory and municipal regulations.

In the routine examination of crude petroleum it is customary to determine the *specific gravity*, and the amount of water and earthy matter in suspension; the oil is also frequently subjected to a process of fractional distillation in order to ascertain whether there has been any addition of distilled products or residue. Petroleum spirit is tested for specific gravity, range of boiling-points, and results of fractional distillation. To illuminating oil or kerosene a series of tests is applied in order that the colour, odour, specific gravity and *flash-point* or *fire-test* may be recorded. In the testing of mineral lubricating oils the *viscosity*, flash-point, "cold-test," and specific gravity are the characters of chief importance. Fuel oil is submitted to certain of the foregoing tests and in addition the *calorimetric value* is determined. Paraffin wax is tested for *melting-point* (or setting-point), and the semi-refined product is further examined to ascertain the percentage of oil, water and dirt present.

In civilized countries provision is made by law for the testing of the flash-point or fire-test of lamp-oil (illuminating oil or kerosene), the method of testing and the minimum limit of flash-point or fire-test being prescribed (see below, *Legislation*).

The earliest form of testing instrument employed for this purpose was that of Giuseppe Tagliabue of New York, which consists of a glass cup placed in a copper water bath heated by a spirit lamp. The cup is filled with the oil to be tested, a thermometer placed in it and heat applied, the temperatures being noted at which, on passing a lighted splinter of wood over the surface of the oil, a flash occurs, and after further heating, the oil ignites. The first temperature is known as the flash-point, the second as the "fire-test." Such an apparatus, in which the oil-cup is uncovered, is known as an open-test instrument. In Saybolt's Electric Tester (1879) ignition is effected by a spark from an induction-coil passing between platinum points placed at a fixed distance above the oil.

Before long, however, it was found that the open-cup tests (though they are employed in the United States and elsewhere at the present time) were often very untrustworthy. Accordingly Keates proposed the substitution of a closed cup in 1871, but his suggestions were not adopted. In 1875 Sir Frederick Abel, at the request of the British Government, began to investigate the matter, and in August 1879 the "Abel test" was legalized. This apparatus has an oil-cup consisting of a cylindrical brass or gun-metal vessel, the cover of which is provided with three rectangular holes which may be closed and opened by means of a perforated slide moving in grooves; the movement of the slide causes a small oscillating colza- or rape-oil lamp to be tilted so that the flame (of specified size) is brought just below the surface of the lid. The oil-cup is supported in a bath or heating-vessel, consisting of two flat-bottomed copper cylinders, to contain water, heated by a spirit lamp, and provided with an air-space between the water-vessel and the oil-cup. Thermometers are placed in both oil-cup and water-bath, the temperature of the latter being raised to 130° at the commencement of the test, while the oil is put in at about 60° F. Testing is begun when the temperature reaches 66° by slowly drawing the slide open and reclosing it, the speed being regulated by the swing of a pendulum supplied with the instrument. It has been found that variations in barometric pressure affect the flash-point and accordingly corrections have to be made in obtaining strictly comparative results at different pressures. The Abel-Pensky instrument, used in India and in Germany, differs only in being provided with a clockwork arrangement for moving the slide. Numerous other forms of open-test and close-test instruments have from time to time been devised, some of which are in use in the United States and in other countries.

It is still customary to determine the open flash-point and fire-test of lubricating oils, but the close flash-point is also usually ascertained, a modification of the Abel or Abel-Pensky apparatus, known as the Pensky-Martens, having been devised for the purpose. This instrument is so constructed that the higher temperature needed can be readily applied, and it is fitted with a stirrer to equalize the heating of the contents of the oil-cup.

For the testing of the viscosity of lubricating oils the Boverton Redwood standardized viscometer is generally employed in Great Britain. By means of this instrument the time occupied in the flow of a measured quantity of the oil through a small orifice at a given temperature is measured.

Uses.—Petroleum has very long been known as a source of light and heat, while the use of crude oil for the treatment of wounds and cutaneous affections, and as a lubricant, was even more general and led to the raw material being an article of commerce at a still earlier date. For pharmaceutical purposes crude petroleum is no longer generally used by civilized races, though the product *vaseline* is largely employed in this way, and emulsions of petroleum have been administered internally in various pectoral complaints; while the volatile product termed *rhigolene* has been largely used as a local anaesthetic.

For illuminating purposes, the most extensively used product is kerosene, but both the more and the less volatile portions of petroleum are employed in suitable lamps. Petroleum products are also largely utilized in gas manufacture for, (1) the production of *air-gas*, (2) the manufacture of *oil-gas*, and (3) the enrichment of *coal-gas*. For heating purposes, the stoves employed are practically kerosene lamps of suitable construction, though gasoline is used as a domestic fuel in the United States. The use of petroleum as liquid fuel is dealt with under FUEL, as is the employment of its products in motors, which has greatly

increased the demand for petroleum spirit. Petroleum has largely superseded other oils, and is still gaining ground, as a lubricant for machinery and railway rolling-stock, either alone or in admixture with fixed oils. The more viscous descriptions of mineral oils have also been found suitable for use in the Elmore process of ore-concentration by oil.

Legislation.—Since the inception of the petroleum industry, most civilized countries have prescribed by law a test of flash-point or inflammability, designed in most cases primarily to afford a definition of oils for lighting purposes which may be safely stored without the adoption of special precautions. In the United Kingdom the limit has, for the purpose in question, been fixed by the legislature at 73° F., by the "Abel-test," which is the equivalent of the former standard of 100° F. by the "open-test." While the subject of the testing of petroleum for legislative purposes has been investigated in Great Britain by committees of both branches of the legislature, with a view to change in the law, the standard has never been raised, since such a course would tend to reduce the available supply and thus lead to increase in price or deterioration in quality. Moreover the chief object of the Petroleum Acts passed in the United Kingdom has hitherto been to regulate storage, and it has always been possible to obtain oils either of higher or lower flash-point, when such are preferred, irrespective of the legal standard, in addition to which it may be asserted that in a properly constructed lamp used with reasonable care the ordinary oil of commerce is a safe illuminant. The more recent legislation with regard to "petroleum spirit" relates mainly to the quantity which may be stored for use on "light locomotives."

The more important local authorities throughout the country have made regulations under the powers conferred upon them by the Petroleum Acts, with the object of regulating the "keeping, sale, conveyance and hawking" of petroleum products having a flash point below 73° F., and the Port of London authority, together with other water-way and harbour authorities in the United Kingdom, have their own by-laws relating to the navigation of vessels carrying such petroleum.

In other countries the flash-point standards differ considerably, as do the storage regulations. In France, the standard is 35° C. (Granier tester, equivalent to 98° F.), and according to their flash-point, liquid hydrocarbons are divided into two classes (below and above 35° C.), considered differently in regard to quantities storable and other regulations. In Germany, the law prescribes a close-test of 21° C., equal to about 70° F., whilst in Russia the standard is 28° C., equal to 84·4° F., by the close-test; in both these countries the weights of petroleum which may be stored in specified buildings are determined by law. In the United States, various methods of testing and various minimum standards have been adopted. In Pennsylvania, the prescribed limit is a "fire-test" of 110° F., equivalent to about 70° F., close-test, while in the State of New York it is 100° F., close-test.

Höfer, *Das Erdöl*, 5 vols. (1909 seq.); A. B. Thompson, *The Oil Fields of Russia* (1908); and J. D. Henry, *Oil Fields of the Empire* (1910). (B. R.)

PETROLOGY, the science of rocks (Gr. πέτρος), the branch of geology which is concerned with the investigation of the composition, structure and history of the rock masses which make up the accessible portions of the earth's crust. Rocks have been defined as "aggregates of minerals." They are the units with which the geologist deals in investigating the structure of a district. Some varieties cover enormous areas and are among the commonest and most familiar objects of nature. Granite, sandstone, clay, limestone, slate often form whole provinces and build up lofty mountains. Such unconsolidated materials as sand, gravel, clay, soil are justly included among rocks as being mineral masses which play an important rôle in field geology. Other rock species are of rare occurrence and may be known in only one or two localities in distant parts of the earth's surface. Nearly all rocks consist of minerals, whether in a crystalline or non-crystalline state, but the insoluble and imperishable parts of the skeletons of animals and plants may constitute a considerable portion of rocks, as for example, coral limestone, lignite beds and chalk.

Treatment of the Subject.—In this paragraph the subject matter of the science of petrology is briefly surveyed; the object is to point out the headings under which particular subjects are treated (there is a separate article on the terms printed in italics). General questions as to the nature, origin and classification of rocks and the methods of examination are discussed in the present article; *mineralogy* comprises similar matter respecting the component minerals; *metamorphism, metasomatism, pneumatolysis* and the formation of *concretions* are agencies which effect rocks and modify them. Three classes of rocks are recognized: the igneous, sedimentary and metamorphic. The plutonic, or deep-seated rocks, which cooled far below the surface, and occur as *batholites*, bosses, *laccolites*, and *veins*, include the great classes *granite, syenite, diorite, gabbro* and *peridotite*; related to the granites are *aplite greisen, pegmatite, schorl* rock and *micropegmatite*; to the syenites, *borolanite, monzonite nepheline-syenite* and *ijolite*; to the diorites, *aphanite, napoleonite* and *tonalite*; to the gabbros, *pyroxenite* and *theralite* and to peridotites, *picrite* and *serpentine*. The hypabyssal intrusive rocks, occurring as *sills, veins, dikes, necks*, &c., are represented by *porphyry* and *porphyrite* (including *bostonite, felsite* and *quartz-porphyry*), *diabase* and *lamprophyre*; some *pitchstones* belong to this group and contain *crystallites* and *spherulites*. The volcanic rocks, found typically as lava flows, include *rhyolite* and *obsidian* (with sometimes *perlite*), *trachyte* and *phonolite* (and leucitophyre which is treated under *leucite*), *andesite* and *dacite, basalt* (with the related *dolerite, variolite* and *tachylyte*), *nephelinite* and *tephrite*. Among sedimentary rocks we recognize a volcanic group (including *tuff, agglomerate* and some kinds of *pumice*); an arenaceous series such as *sand* (some with *glauconite*), *sandstone, quartzite, greywacke* and *gravel*; an argillaceous group including *clay, firebrick, phyllite, laterite, shale* and *slate*; a calcareous series with *chalk, limestone* (often forming *stalactites* and *stalagmites*), *dolomite* and *marls* or argillaceous limestones (*flint* occurs as nodules in chalk); the natural *phosphates* may be mentioned here. The metamorphic rocks are commonly *gneisses* and *schists* (including *mica-schist*); other types are *amphibolite, charnockite, eclogite, epidiorite, epidosite, granulite, itacolumite, hornfels, mylonite* and the *scapolite* rocks.

Composition.—Only the commonest minerals are of importance as rock formers. Their number is small, not exceeding a hundred in all, and much less than this if we do not reckon the subdivisions into which the commoner species are broken up. The vast majority of the rocks which we see around us every day consist of quartz, feldspar, mica, chlorite, kaolin, calcite, epidote, olivine, augite, hornblende, magnetite, haematite, limonite and a few other minerals. Each of these has a recognized position in the economy of nature. A main determining factor is the chemical composition of the mass, for a certain mineral can be formed only when the necessary elements are present in the rock. Calcite is commonest in limestones, as these consist essentially of carbonate of lime; quartz in sandstones and in certain igneous rocks which contain a high percentage of silica. Other factors are of equal importance in determining the natural association or paragenesis of rock-making minerals, principally the mode of origin of the rock and the stages through which it has passed in attaining its present condition. Two rock masses may have very much the same bulk composition and yet consist of entirely different assemblages of minerals. The tendency is always for those compounds to be formed which are stable under the conditions under which the rock mass originated. A granite arises by the consolidation of a molten magma (a fused rock mass; Gr. μάγμα, from μάσσειν, to knead) at high temperatures and great pressures and its component minerals are such as are formed in such circumstances. Exposed to moisture, carbonic acid and other subaerial agents at the ordinary temperatures of the earth's surface, some of these original minerals, such as quartz and white mica are permanent and remain unaffected; others "weather" or decay and are replaced by new combinations. The feldspar passes into kaolin, muscovite and quartz, and if any black mica (biotite) has been present it yields chlorite, epidote, rutile and other substances. These changes are accompanied by disintegration, and the rock falls into a loose, incoherent, earthy mass which may be regarded as a sand or soil. The materials thus formed may be washed away and deposited as a sandstone or grit. The structure of the original rock is now replaced by a new one; the mineralogical constitution is profoundly altered; but the bulk chemical composition may not be very different. The sedimentary rock may again undergo a metamorphosis. If penetrated by igneous rocks it may be recrystallized or, if subjected to enormous pressures with heat and movement, such as attend the building of folded mountain chains, it may be converted into a gneiss not very different in mineralogical composition though radically different in structure to the granite which was its original state.

Structure.—The two factors above enumerated, namely the chemical and mineral composition of rocks, are scarcely of greater

importance than their structure, or the relations of the parts of which they consist to one another. Regarded from this standpoint rocks may be divided into the crystalline and the fragmental. Inorganic matter, if free to take that physical state in which it is most stable, always tends to crystallize. Crystalline rock masses have consolidated from solution or from fusion. The vast majority of igneous rocks belong to this group and the degree of perfection in which they have attained the crystalline state depends primarily on the conditions under which they solidified. Such rocks as granite, which have cooled very slowly and under great pressures, have completely crystallized, but many lavas were poured out at the surface and cooled very rapidly; in this latter group a small amount of non-crystalline or glassy matter is frequent. Other crystalline rocks such as rock-salt, gypsum and anhydrite have been deposited from solution in water, mostly owing to evaporation on exposure to the air. Still another group, which includes the marbles, mica-schists and quartzites, are recrystallized, that is to say, they were at first fragmental rocks, like limestone, clay and sandstone and have never been in a molten condition nor entirely in solution. Certain agencies however, acting on them, have effaced their primitive structures, and induced crystallization. This is a kind of metamorphism.

Crystalline Rocks.

The fragmental structure needs little explanation; wherever rocks disintegrate fragments are produced which are suitable for the formation of new rocks of this group. The original materials may be organic (shells, corals, plants) or vitreous (volcanic glasses) or crystalline (granite, marble, &c.); the pulverizing agent may he frost, rain, running water, or the steam explosions which shatter the lava within a volcanic crater and produce the fragmental rocks known as volcanic ash, toffs and agglomerates. The materials may be loose and incoherent (sand, clay, gravel) or compacted by pressure and the deposit of cementing substances by percolating water (sandstone, shale, conglomerate). The grains of which fragmental rocks are composed may be coarse or fine, fresh or decayed, uniform or diverse in their composition; the one feature which gives unity to the class is the fact that they are all derived from pre-existing rocks or organisms. Because they are made up of broken pieces these rocks are often said to he " clastic."

Fragmental Rocks.

Origin of Rocks.—The study of the structure of rocks evidently leads us to another method of regarding them, which is more fundamental than those enumerated above, as the structure depends on the mode of origin. Rocks are divided into three great classes, the Igneous, the Sedimentary and the Metamorphic.

The *igneous* (Lat. *ignis*, fire) rocks have all consolidated from a state of fusion. Some of them are crystalline or "massive"; others are fragmental. The massive igneous rocks include a few which are nearly completely vitreous, and still more which contain a small amount of amorphous matter, but the majority are completely crystallized. Among the best known examples are obsidian, pumice, basalt, trachyte, granite, diorite. The fragmental igneous rocks consist of volcanic ashes more or less firmly compacted.

Igneous Rocks.

The *sedimentary* rocks form a second group; they have all been laid down as deposits on the earth's surface subject to the conditions of temperature, moisture and pressure which obtain there. They include fragmental and crystalline varieties. The former consist of the débris of pre-existing rocks, accumulated in seas, lakes or dry land and more or less indurated by pressure and cementing substances. Gravel, sand and clay, conglomerate, sandstone, shale are well-known examples. Many of them are fossiliferous as they contain fragments of organisms. Some are very largely made up of remains of animals or plants, more or less altered by mineralization. These are sometimes placed into a special group as rocks of organic origin; limestone, peat and coal are typical of this class. The crystalline sediments are such as rock-salt and gypsum, deposits of saline lakes or isolated portions of the sea. They were formed under conditions unfavourable to life and hence rarely contain fossils. The *metamorphic* rocks are known to be almost entirely altered igneous or sedimentary masses. Metamorphism consists in the destruction of the original structures and the development of new minerals. The chemical composition of the rocks however suffers little change. The rock becomes as a rule more crystalline; but all stages in the process may be found and in a metamorphosed sediment, *e.g.* a sandstone, remains of the original sand grains and primary fragmental structore may be observed, although extensive recrystallization has taken place. The agencies which produce metamorphism are high temperatures, pressure, interstitial moisture and in many cases movement. The effects of high temperatures are seen best in the rocks surrounding great outcrops of intrusive granite, for they have been baked and crystallized by the heat of the igneous rock (thermo-metamorphism). In folded mountain chains where the strata have been greatly compressed and their particles have been forced to move over one another a different type of metamorphism prevails (regional or dynamic metamorphism).

Sedimentary Rocks.

Metamorphic Rocks.

Methods of Investigation.—The macroscopic (Gr. μακρός, large) characters of rocks, those visible in hand-specimens without the aid of the microscope, are very varied and difficult to describe accurately and fully. The geologist in the field depends principally on them and on a few rough chemical and physical tests; and to the practical engineer, architect and quarry-master they are all-important. Although frequently insufficient in themselves to determine the true nature of a rock, they usually serve for a preliminary classification and often give all the information which is really needed. With a small bottle of acid to test for carbonate of lime, a knife to ascertain the hardness of rocks and minerals, and a pocket lens to magnify their structure, the field geologist is rarely at a loss to what group a rock belongs. The fine grained species are often indeterminable in this way, and the minute mineral components of all rocks can usually be ascertained only by microscopic examination. But it is easy to see that a sandstone or grit consists of more or less rounded, waterworn sand-grains and if it contains dull, weathered particles of feldspar, shining scales of mica or small crystals of calcite, these also rarely escape observation. Shales and clay rocks generally are soft, fine grained, often laminated, and not infrequently contain minute organisms or fragments of plants. Limestones are easily marked with a knife-blade, effervesce readily with weak cold acid, and often contain entire or broken shells or other fossils. The crystalline nature of a granite or basalt is obvious at a glance, and while the former contains white or pink feldspar, clear vitreous quartz and glancing flakes of mica, the other will show yellow-green olivine, black augite and grey striated plagioclase.

Macroscopic Characters.

But when dealing with unfamiliar types or with rocks so fine grained that their component minerals cannot be determined with the aid of a lens, the geologist is obliged to have recourse to more delicate and searching methods of investigation. With the aid of the blowpipe (to test the fusibility of detached crystals), the goniometer, the magnet, the magnifying glass and the specific gravity balance, the earlier travellers attained surprisingly accurate results. Examples of these may be found in the works of Von Buch, Scrope, Darwin and many others. About the end of the 18th century, Dolomieu examined crushed rock powders under the microscope and Cordier in 1815 crushed, levigated and investigated the finer ground-mass of igneous rocks. His researches are models of scrupulous accuracy, and he was able to announce that they consisted essentially of such minerals as feldspar, augite, iron ores and volcanic glass, and did not differ in nature from the coarser grained rocks. Nicol, whose name is associated with the discovery of the Nicol's prism, seems to have been the first to prepare thin slices of mineral substances, and his methods were applied by Witham (1831) to the study of plant petrifactions. This method, of such far-reaching importance in petrology, was not at once made use of for the systematic

Microscopic Characters.

investigation of rocks, and it was not till 1858 that Sorby pointed out its value. Meanwhile the optical study of sections of crystals had been advanced by Sir David Brewster and other physicists and mineralogists and it only remained to apply their methods to the minerals visible in rock sections. Very rapid progress was made and the names of Zirkel, Allport, Vogelsang, Schuster, Rosenbusch, Bertrand, Fouqué and Lévy are among those of the most active pioneers in the new field of research. To such importance have microscopical methods attained that textbooks of petrology at the present time are very largely devoted to a description of the appearances presented by the minerals of rocks as studied in transparent micro-sections.

Sections. A good rock-section should be about one-thousandth of an inch in thickness, and is by no means very difficult to make. A thin splinter of the rock, about as large as a halfpenny may be taken; it should be as fresh as possible and free from obvious cracks. By grinding on a plate of planed steel or cast iron with a little fine carborundum it is soon rendered flat on one side and is then transferred to a sheet of plate glass and smoothed with the very finest emery till all minute pits and roughnesses are removed and the surface is a uniform plane. The rock-chip is then washed, and placed on a copper or iron plate which is heated by a spirit or gas lamp. A microscopic glass slip is also warmed on this plate with a drop of viscous natural Canada balsam on its surface. The more volatile ingredients of the balsam are dispelled by the heat, and when that is accomplished the smooth, dry, warm rock is pressed firmly into contact with the glass plate so that the film of balsam intervening may be as thin as possible and free from air-bubbles. The preparation is allowed to cool and then the rock chip is again ground down as before, first with carborundum and, when it becomes transparent, with fine emery till the desired thickness is obtained. It is then cleaned, again heated with a little more balsam, and covered with a cover glass. The labour of grinding the first surface may be avoided by cutting off a smooth slice with an iron disk armed with crushed diamond powder. A second application of the slitter after the first face is smoothed and cemented to the glass will in expert hands leave a rock-section so thin as to be already transparent. In this way the preparation of a section may require only twenty minutes.

Microscope. The microscope employed is usually one which is provided with a rotating stage beneath which there is a polarizer, while above the objective or the eyepiece an analyser is mounted; alternatively the stage may be fixed and the polarizing and analysing prisms may be capable of simultaneous rotation by means of toothed wheels and a connecting-rod. If ordinary light and not polarized light is desired, both prisms may be withdrawn from the axis of the instrument; if the polarizer only is inserted the light transmitted is plane polarized; with both prisms in position the slide is viewed between "crossed nicols." A microscopic rock-section in ordinary light if a suitable magnification (say 30) be employed is seen to consist of grains or crystals varying in colour, size and shape. *Characters of Minerals.* Some minerals are colourless and transparent (quartz, calcite, feldspar, muscovite, &c.), others are yellow or brown (rutile, tourmaline, biotite), green (diopside, hornblende, chlorite), blue (glaucophane), pink (garnet), &c. The same mineral may present a variety of colours, in the same or different rocks, and these colours may be arranged in zones parallel to the surfaces of the crystals. Thus tourmaline may be brown, yellow, pink, blue, green, violet, grey or colourless, but every mineral has one or more characteristic, because most common tints. The shapes of the crystals determine in a general way the outlines of the sections of them presented on the slides. If the mineral has one or more good cleavages they will be indicated by systems of cracks (see Plate III.). The refractive index is also clearly shown by the appearance of the sections, which are rough, with well-defined borders if they have a much stronger refraction than the medium in which they are mounted. Some minerals decompose readily and become turbid and semi-transparent (*e.g.* feldspar); others remain always perfectly fresh and clear (*e.g.* quartz), others yield characteristic secondary products (such as green chlorite after biotite). The inclusions in the crystals are of great interest; one mineral may enclose another, or may contain spaces occupied by glass, by fluids or by gases.

Micro-structure. Lastly the *structure* of the rock, that is to say, the relation of its components to one another, is usually clearly indicated, whether it be fragmental or massive; the presence of glassy matter in contradistinction to a completely crystalline or "holo-crystalline" condition; the nature and origin of organic fragments; banding, foliation or lamination; the pumiceous or porous structure of many lavas; these and many other characters, though often not visible in the hand specimens of a rock, are rendered obvious by the examination of a microscopic section. Many refined methods of observation may be introduced, such as the measurement of the size of the elements of the rock by the help of micrometers; their relative proportions by means of a glass plate ruled in small squares; the angles between cleavages or faces seen in section by the use of the rotating graduated stage, and the estimation of the refractive index of the mineral by comparison with those of different mounting media.

Pleochroism. Further information is obtained by inserting the polarizer and rotating the section. The light vibrates now only in one plane, and in passing through doubly refracting crystals in the slide is, speaking generally, broken up into two rays, which vibrate at right angles to one another. In many coloured minerals such as biotite, hornblende, tourmaline, chlorite, these two rays have different colours, and when a section containing any of these minerals is rotated the change of colour is often very striking. This property, known as "pleochroism" (Gr. πλείων, more; χρώς, colour), is of great value in the determination of rock-making minerals. It is often especially intense in small spots which surround minute enclosures of other minerals such as zircon and epidote; these are known as "pleochroic halos."

Double Refraction. If the analyser be now inserted in such a position that it is crossed relatively to the polarizer the field of view will be dark where there are no minerals, or where the light passes through isotropic substances such as glass, liquids and cubic crystals. All other crystalline bodies, being doubly refracting, will appear bright in some position as the stage is rotated. The only exception to this rule is provided by sections which are perpendicular to the optic axes of birefringent crystals; these remain dark or nearly dark during a whole rotation, and as will be seen later, their investigation is of special importance. *Extinction.* The doubly refracting mineral sections, however, will in all cases appear black in certain positions as the stage is rotated. They are said to be "extinguished" when this takes place. If we note these positions we may measure the angle between them and any cleavages, faces or other structures of the crystal by means of the rotating stage. These angles are characteristic of the system to which the mineral belongs and often of the mineral species itself (see CRYSTALLOGRAPHY). To facilitate measurement of extinction angles various kinds of eyepieces have been devised, some having a stauroscopic calcite plate, others with two or four plates of quartz cemented together; these are often found to give more exact results than are obtained by observing merely the position in which the mineral section is most completely dark between crossed nicols.

The mineral sections when not extinguished are not only bright but are coloured and the colours they show depend on several factors, the most important of which is the strength of the double refraction. If all the sections are of the same thickness as is nearly true of well-made slides, the minerals with strongest double refraction yield the highest polarization colours. The order in which the colours are arranged is that known as Newton's scale, the lowest being dark grey, then grey, white, yellow, orange, red, purple, blue and so on. The difference between the refractive indexes of the ordinary and the extraordinary ray in quartz is ·009, and in a rock-section about $\frac{1}{500}$ of an inch thick this mineral gives grey and white polarization tints; nepheline with weaker double refraction gives dark grey; augite on the other hand will give red and blue, while calcite with still stronger double refraction will appear pinkish or greenish white. All sections of the same mineral, however, will not have the same colour; it was stated above that sections perpendicular to an optic axis will be nearly black, and, in general, the more nearly any section approaches this direction the lower its polarization colours will be. By taking the average, or the highest colour given by any mineral, the relative value of its double refraction can be estimated; or if the thickness of the section be precisely known the difference between the two refractive indexes can be ascertained. If the slides be thick the colours will be on the whole higher than in thin slides.

It is often important to find out whether of the two axes of elasticity (or vibration traces) in the section is that of greater elasticity (or lesser refractive index). The quartz wedge or selenite plate enables us to do this. Suppose a doubly refracting mineral section so placed that it is "extinguished"; if now it is rotated through 45° it will be brightly illuminated. If the quartz wedge be passed across it so that the long axis of the wedge is parallel to the axis of elasticity in the section the polarization colours will rise or fall. If they rise the axes of greater elasticity in the two minerals are parallel; if they sink the axis of greater elasticity in the one is parallel to that of lesser elasticity in the other. In the latter case by pushing the wedge sufficiently far complete darkness or compensation will result. Selenite wedges, selenite plates, mica wedges and mica plates are also used for this purpose. A quartz wedge also may be calibrated by determining the amount of double refraction in all parts of its length. If now it be used to produce compensation or complete extinction in any doubly refracting mineral section, we can ascertain what is the strength of the double refraction of the section because it is obviously equal and opposite to that of a known part of the quartz wedge.

A further refinement of microscopic methods consists of the use of strongly convergent polarized light (konoscopic methods). This is obtained by a wide-angled achromatic condenser above the polarizer, and a high power microscopic objective. Those sections are most useful which are perpendicular to an optic axis, and consequently remain dark on rotation. If they belong to uniaxial crystals they show a dark cross or convergent light between crossed nicols,

the bars of which remain parallel to the wires in the field of the eyepiece. Sections perpendicular to an optic axis of a biaxial mineral under the same conditions show a dark bar which on rotation becomes curved to a hyperbolic shape. If the section is perpendicular to a "bisectrix" (see CRYSTALLOGRAPHY) a black cross is seen which on rotation opens out to form two hyperbolas, the apices of which are turned towards one another. The optic axes emerge at the apices of the hyperbolas and may be surrounded by coloured rings, though owing to the thinness of minerals in rock sections these are only seen when the double refraction of the mineral is strong. The distance between the axes as seen in the field of the microscope depends partly on the axial angle of the crystal and partly on the numerical aperture of the objective. If it is measured by means of an eye-piece micrometer, the optic axial angle of the mineral can be found by a simple calculation. The quartz wedge, quarter mica plate or selenite plate permit the determination of the positive or negative character of the crystal by the changes in the colour or shape of the figures observed in the field. These operations are precisely similar to those employed by the mineralogist in the examination of plates cut from crystals. It is sufficient to point out that the petrological microscope in its modern development is an optical instrument of great precision, enabling us to determine physical constants of crystallized substances as well as serving to produce magnified images like the ordinary microscope. A great variety of accessory apparatus has been devised to fit it for these special uses.

Separation of Components. The separation of the ingredients of a crushed rock powder from one to another in order to obtain pure samples suitable for analysis is also extensively practised. It may be effected by means of a powerful electro-magnet the strength of which can be regulated as desired. A weak magnetic field will attract magnetite, then haematite and other ores of iron. Silicates containing iron will follow in definite order and biotite, enstatite, augite, hornblende, garnet and similar ferro-magnesian minerals may be successively abstracted; at last only the colourless, non-magnetic compounds, such as muscovite, calcite, quartz and feldspar, will remain. Chemical methods also are useful. A weak acid will dissolve calcite from a crushed limestone, leaving only dolomite, silicates or quartz. Hydrofluoric acid will attack feldspar before quartz, and if employed with great caution will dissolve these and any glassy material in a rock powder before dissolving augite or hypersthene. Methods of separation by specific gravity have a still wider application. The simplest of these is levigation (Lat. *levigare*, to make smooth, *levis*) or treatment by a current of water; it is extensively employed in the mechanical analysis of soils and in the treatment of ores, but is not so successful with rocks, as their components do not as a rule differ very greatly in specific gravity.

Fluids are used which do not attack the majority of the rock-making minerals and at the same time have a high specific gravity. Solutions of potassium mercuric iodide (sp. gr. 3·196), cadmium borotungstate (sp. gr. 3·30), methylene iodide (sp. gr. 3·32), bromoform (sp. gr. 2·86), or acetylene bromide (sp. gr. 3·00) are the principal media employed. They may be diluted (with water, benzene, &c.) to any desired extent and again concentrated by evaporation. If the rock be a granite consisting of biotite (sp. gr. 3·1), muscovite (sp. gr. 2·85), quartz (sp. gr. 2·65), oligoclase (sp. gr. 2·64) and orthoclase (sp. gr. 2·56) the crushed minerals will all float in methylene iodide; on gradual dilution with benzene they will be precipitated in the order given above. Although simple in theory these methods are tedious in practice, especially as it is common for one rock-making mineral to enclose another. But expert handling of fresh and suitable rocks yields excellent results and much purer powders may be obtained by this means than by any other.

Examination of Rock Powders. Although rocks are now studied principally in microscopic sections the investigation of fine crushed rock powders, which was the first branch of microscopic petrology to receive attention, is by no means discontinued. The modern optical methods are perfectly applicable to transparent mineral fragments of any kind. Minerals are almost as easily determined in powder as in section, but it is otherwise with rocks, as the structure or relation of the components to one another, which is an element of great importance in the study of the history and classification of rocks, is almost completely destroyed by grinding them to powder.

In addition to naked-eye and microscopic investigations chemical methods of research are of the greatest practical utility to the petrographer. The crushed and separated powders, obtained by the processes described above, may be analysed and thus the chemical composition of the minerals in the rock determined qualitatively or quantitatively. The chemical testing of microscopic sections and minute grains by the help of the microscope is a very elegant and valuable means of discriminating between the mineral components of fine-grained rocks. Thus the presence of apatite in rock-sections is established by covering a bare rock-section with solution of ammonium molybdate; a turbid yellow precipitate forms over the crystals of the mineral in question (indicating the presence of phosphates). Many silicates are insoluble in acids and cannot be tested in this way, but others are partly dissolved, leaving a film of gelatinous silica which can be stained with colouring matters such as the aniline dyes (nepheline, analcite, zeolites, &c.).

Chemical Analysis.

Complete chemical analyses of rocks are also widely made use of and are of the first importance, especially when new species are under description. Rock analysis has of late years (largely under the influence of the chemical laboratory of the United States Geological Survey) reached a high pitch of refinement and complexity. As many as twenty or twenty-five components may be determined, but for practical purposes a knowledge of the relative proportions of silica, alumina, ferrous and ferric oxides, magnesia, lime, potash, soda and water will carry us a long way in determining the position to which a rock is to be assigned in any of the conventional classifications. A chemical analysis is in itself usually sufficient to indicate whether a rock is igneous or sedimentary and in either case to show with considerable accuracy to what subdivision of these classes it belongs. In the case of metamorphic rocks it often establishes whether the original mass was a sediment or of volcanic origin.

Specific Gravity. The specific gravity of rocks is determined in the usual way by means of the balance and the pycnometer. It is greatest in those rocks which contain most magnesia, iron and heavy metals; least in rocks rich in alkalis, silica and water. It diminishes with weathering, and generally those rocks which are highly crystalline have higher specific gravities than those which are wholly or partly vitreous when both have the same chemical composition. The specific gravity of the commoner rocks ranges from about 2·5 to 3·2.

Rock Synthesis. The above methods of investigation, naked eye, physical, microscopical, chemical, may be grouped together as analytical in contradistinction to the synthetic investigation of rocks, which proceeds by experimental work to reproduce different rock types and in this way to elucidate their origin and explain their structures. In many cases no experiment is necessary. Every stage in the origin of clays, sands and gravels can be seen in process around us, but where these have been converted into coherent shales, sandstones and conglomerates, and still more where they have experienced some degree of metamorphism, there are many obscure points about their history upon which experiment may yet throw light. Up to the present time these investigations have been almost entirely confined to the attempt to reproduce igneous rocks by fusion of mixtures of crushed minerals or of chemicals in specially contrived furnaces. The earliest researches of this sort are of those of Faujas St Fond and of de Saussure, but Sir James Hall really laid the foundations of this branch of petrology. He showed (1798) that the whinstones (diabases) of Edinburgh were fusible, and if rapidly cooled yielded black vitreous masses closely resembling natural pitchstones and obsidians; if cooled more slowly they consolidated as crystalline rocks not unlike the whinstones themselves and containing olivine, augite and feldspar (the essential minerals of these rocks). Many years later Daubrée, Delesse and others carried on similar experiments, but the first notable advance was made in 1878, when Fouqué and Lévy began their researches.

They succeeded in producing such rocks as porphyrite, leucite-tephrite, basalt and dolerite, and obtained also various structural modifications well known in igneous rocks, *e.g.* the porphyritic and the ophitic (Gr. ὄφις, serpent). Incidentally they showed that while many basic rocks (basalts, &c.) could be perfectly imitated in the laboratory, the acid rocks could not, and advanced the explanation that for the crystallization of the latter the gases never absent in natural rock magmas were indispensable mineralizing agents. It has subsequently been proved that steam, or such volatile substances as certain borates, molybdates, chlorides, fluorides, assist in the formation of orthoclase, quartz and mica (the minerals of granite). Sir James Hall also made the first contribution to the experimental study of metamorphic rocks by converting chalk

FIG. 1.—BANDED OBSIDIAN, KIRGHIZ (× 25).

The rock consists of alternate bands of brown and colourless glass which have been arranged in stripes by the fluxion movement of the viscous mass before solidification. The glass is rendered granular by very minute crystals.

FIG. 2.—FLUIDAL RHYOLITE, HUNGARY (× 15).

In the centre are crystals of felspar, rather turbid through weathering. The matrix is partly glassy, partly felsitic, and shows the effects of streaming movements, with eddies behind the felspar crystals.

FIG. 3.—OBSIDIAN, MEXICO (× 15).

This rock has a damascened pattern owing to the irregular mingling of streams of brown and of colourless glass. It is nearly quite free from minute crystals.

FIG. 4.—PERLITIC OBSIDIAN, TOKAI, HUNGARY (× 15).

The clear glassy rock is traversed by a large number of cracks, some long and straight, while others are nearly circular. These are rendered more distinct by the deposit of thin films of secondary limonite in them. The cracks are due to contraction on cooling.

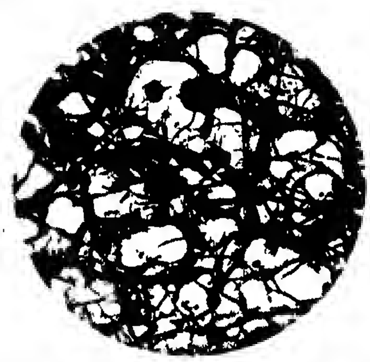

FIG. 5.—PERLITIC PITCHSTONE, MEISSEN, GERMANY (× 15).

The perlitic, rounded cracks are very clearly seen, because the rock is decomposing and becoming slightly opaque along them. At the top there is a corroded crystal of felspar, showing cleavage, with large circular enclosures of brownish glass.

FIG. 6.—OBSIDIAN, ICELAND (× 17).

In the clear glassy base there are rounded yellow spots (spherulites) arranged in fluxion streams.

FIG. 7.—SPHERULITIC RHYOLITE, HLINIK, HUNGARY (× 10).

The white, angular patches are crystals of quartz and of sanidine felspar. Between them there is a yellowish glass showing circular areas with a well-defined radiate fibrous structure (spherulites).

FIG. 8.—SPHERULITIC FELSITE, ARRAN, SCOTLAND (× 10).

The round spherulites of this rock are large and sometimes composite; their radiate structure is obvious. This is a devitrified pitchstone, no longer glassy but finely crystalline, and at the centres of the spherulites there are spaces occupied by a secondary deposit of quartz.

FIG. 9.—PORPHYRITIC AND FLUIDAL RHYOLITE, HUNGARY (× 12).

The ground-mass is partly glassy, partly felsitic, and shows fluxion-banding. The large quartz is a double hexagonal pyramid, but its edges and corners are rounded by corrosion, and large irregular areas of glass penetrate to its centre.

FIG. 1.—PORPHYRITIC PITCHSTONE, SCUIR OF EIGG, SCOTLAND (× 10).

A large porphyritic felspar crystal is seen lying in a pale-brown glassy base and containing many glass inclusions of irregular shape. The felspar, in one margin especially, shows corroded outlines.

FIG. 2.—TRACHYTE, OROTAVA, TENERIFFE (× 12).

There are larger porphyritic felspars of the first generation, and smaller ones of later origin composing part of the ground-mass, which also contains a considerable amount of yellow vitreous material.

FIG. 3.—TRACHYTE, PERLENHARDT, GERMANY (× 10).

In this rock there are porphyritic crystals of felspar and of dark brown biotite (nearly black in the photograph), with a few of green augite and magnetite. The ground-mass is finely crystalline.

FIG. 4.—GRANITE, RUBISLAW, ABERDEEN (× 10).

This is a non-porphyritic, holocrystalline rock. Among its components the crystals of dark mica are conspicuous, and with them occur also a few plates of white mica, with perfect cleavage. The slightly turbid or granular substance is felspar, a little decomposed, and the large clear spaces are crystals of quartz.

FIG. 5.—HORNBLENDE-GRANITE, DALBEATTIE, SCOTLAND (× 15).

The dark crystal with fine parallel lines of cleavage is biotite; the others, with two less perfect cleavages, are hornblende. At the top there is a long rod-shaped grain of sphene. The granular-looking substance is felspar, and the quartz, as usual, is clear and transparent.

FIG. 6.—GRAPHIC GRANITE, LODENMAIS, BAVARIA (× 10).

This rock consists of angular patches of clear quartz scattered through a striated dull matrix of felspar. The different quartz areas have all the same optical orientation, as if they were parts of a single crystal.

FIG. 7.—LUXULLIANITE, LUXULYAN, CORNWALL (× 15).

In this variety of tourmaline-granite there are many blue needles of tourmaline, grouped in stellate clusters which are embedded in a matrix of clear quartz. These pointed needles diverge from the surfaces of larger grains of tourmaline.

FIG. 8.—GRANOPHYRE, BRAEMAR, SCOTLAND (× 37).

This photograph is taken between crossed nicols to show the graphic structure of the ground-mass, similar to that of Fig. 6, but on a much finer scale. The quartz towards the centre of the field appears as white, angular areas, embedded in a grey matrix of felspar, and each mineral reacts in a uniform fashion

FIG. 9.—DIORITE, HODRITCH, HUNGARY (× 10).

The dark crystals are green hornblende, and show the outlines which are characteristic of that mineral. The cloudy grey substance between them is felspar in a somewhat weathered state.

into marble by heating it in a closed gun-barrel, which prevented the escape of the carbonic acid at high temperatures. Adams and Nicholson have carried this a stage farther by subjecting marble to great pressure in hydraulic presses and have shown how the foliated structures, frequent in natural marbles, may be produced artificially.

Rock Classification.—The three great classes of rocks above enumerated—the igneous, the sedimentary and the metamorphic—are subdivided into many groups which to a small extent resemble the genera and species under which the naturalist classifies the members of the animal kingdom. There are, however, no hard and fast boundaries between allied rocks. By increase or diminution in the proportions of their constituent minerals they pass by every gradation into one another; the distinctive structures also of one kind of rock may often be traced gradually merging into those of another. Hence the definitions adopted in establishing rock nomenclature merely correspond to selected points (more or less arbitrary) in a continuously graduated series. This is frequently urged as a reason for reducing rock classification to its simplest possible terms, and using only a few generalized rock designations. But it is clear that many apparently trivial differences tend regularly to recur, and have a real significance, and so long as any variation can be shown to be of this nature it deserves recognition.

Igneous Rocks.

The *igneous rocks* (crystalline and fragmental) form a well-defined group, differing in origin from all others. The crystalline or massive varieties may occur in two different ways; the lavas have been poured out at the surface and have consolidated after ejection, under conditions which are fairly well understood, seeing that they may be examined at active volcanoes in many parts of the world; the intrusive rocks, on the other hand, have been injected from below into cracks and fissures in the strata and have cooled there beneath masses which conceal them from view till exposed by denudation at a subsequent period. The members of these two groups differ in many respects from one another, so that it is often possible to assign a rock to one or other of them on mere superficial inspection. The lavas (or effusive rocks), having cooled rapidly in contact with the air, are mostly finely crystalline or have at least fine-grained ground-mass representing that part of the viscous semi-crystalline lava flow which was still liquid at the moment of eruption. At this time they were exposed only to atmospheric pressure, and the steam and other gases, which they contained in great quantity, were free to escape; many important modifications arise from this, the most striking being the frequent presence of numerous steam cavities (vesicular structure) often drawn out to elongated shapes subsequently filled up with minerals by infiltration (amygdaloidal structure). As crystallization was going on while the mass was still creeping forward over the surface of the earth, the latest formed minerals (in the ground-mass) are commonly arranged in subparallel winding lines, following the direction of movement (fluxion or fluidal structure; see Plate I. figs. 2 and 9, Plate II. fig. 2), and the larger early minerals which had previously crystallized may show the same arrangement. Most lavas have fallen considerably below their original temperatures before they are emitted. In their behaviour they present a close analogy to hot solutions of salts in water, which, when they approach the saturation temperature, first deposit a crop of large, well-formed crystals (labile stage) and subsequently precipitate clouds of smaller less perfect crystalline particles (metastable stage). In igneous rocks the first generation of crystals generally forms before the lava has emerged to the surface, that is to say, during the ascent from the subterranean depths to the crater of the volcano. It has frequently been verified by observation that freshly emitted lavas contain large crystals borne along in a molten, liquid mass. The large, well-formed, early crystals are said to be porphyritic (Plate III. figs. 1, 2, 3); the smaller crystals of the surrounding matrix or ground-mass belong to the post-effusion stage. More rarely lavas are completely fused at the moment of ejection; they may then cool to form a non-porphyritic, finely crystalline rock, or if more rapidly chilled may in large part be non-crystalline or glassy (vitreous rocks such as obsidian, tachylyte, pitchstone (Plate I. figs. 1, 4, 5). A common feature of glassy rocks is the presence of rounded bodies (spherulites: Gr. σφαῖρα, ball), consisting of fine divergent fibres radiating from a centre (Plate I. figs. 7, 8); they consist of imperfect crystals of feldspar, mixed with quartz or tridymite; similar bodies are often produced artificially in glasses which are allowed to cool slowly. Rarely these spherulites are hollow or consist of concentric shells with spaces between (lithophysae: Gr. λίθος, stone; φῦσα, bellows). Perlitic structure, also common in glasses, consists in the presence of concentric rounded cracks owing to contraction on cooling (see PERLITE).

Lavas or Effusive Types.

The phenocrysts (Gr. φαίνειν, to show; κρύσταλλον, crystal) or porphyritic minerals are not only larger than those of the ground-mass. As the matrix was still liquid when they formed they were free to take perfect crystalline shapes, not being interfered with by the pressure of adjacent crystals. They seem to have grown rapidly, as they are often filled with enclosures of glassy or finely crystalline material like that of the ground-mass (Plate II. fig. 1). Microscopic examination of the phenocrysts often reveals that they have had a complex history. Very frequently they show successive layers of different composition, indicated by variations in colour or other optical properties; thus augite may be green at the centre and various shades of brown outside this; or may be pale green centrally and darker green with strong pleochroism (aegirine) at the periphery. In the feldspars the centre is usually more basic and richer in lime than the surrounding faces, and successive zones may often be noted, each less basic than those which lie within it. Phenocrysts of quartz (and of other minerals), instead of sharp, perfect crystalline faces, may show rounded corroded surfaces (Plate I. fig. 9), with the points blunted and irregular tongue-like projections of the matrix into the substance of the crystal. It is clear that after the mineral had crystallized it was partly again dissolved or corroded at some period before the matrix solidified. Corroded phenocrysts of biotite and hornblende are very common in some lavas; they are surrounded by black rims of magnetite mixed with pale green augite. The hornblende or biotite substance has proved unstable at a certain stage of consolidation and has been replaced by a paramorph of augite and magnetite which may be partially or completely substituted for the original crystal but still retains its characteristic outlines.

Plutonic or Abyssal Types.

Let us now consider the characteristics of a typical deep-seated rock like granite or diorite (Plate II. figs. 4, 5, 9). That these are igneous is proved by the manner in which they have burst through the superincumbent strata, filling the cracks with ramifying veins; that they were at a very high temperature is equally clear from the changes which they have induced in the rocks in contact with them. But as their heat could dissipate only very slowly, because of the masses which covered them, complete crystallization has taken place and no vitreous rapidly chilled matter is present. As they have had time to come to rest before crystallizing they are not fluidal. Their contained gases have not been able to escape through the thick layer of strata beneath which they were injected, and may often be observed occupying cavities in the minerals, or have occasioned many important modifications in the crystallization of the rock. Because their crystals are of approximately equal size these rocks are said to be granular; there is typically no distinction between a first generation of large well-shaped crystals and a fine-grained ground-mass. Their minerals have formed, however, in a definite order, and each has had a period of crystallization which may be very distinct or may have coincided with or overlapped the period of formation of some of the other ingredients. The earlier have originated at a time when most of the rock was still liquid and are more or less perfect; the later are less regular in shape because they were compelled to occupy the interspaces left between the already formed crystals (Plate II. figs. 5, 9). The former are said to be idiomorphic (or automorphic), the latter are anidiomorphic (allotriomorphic, xenomorphic).[1] There are also many other characteristics which serve to distinguish the members of these two groups. Orthoclase, for example, is the typical feldspar of granite, while its modification sanidine occurs in lavas of similar composition. The same distinction holds between elaeolite and nepheline. Leucite is common in lavas, very rare in plutonic rocks. Muscovite is confined to the intrusives. These differences show the influence of the physical conditions under which consolidation takes place.

Intrusive or Hypabyssal Types.

There is a certain class of intrusive rocks which have risen upwards towards the surface, but have failed to reach it, and have solidified in fissures as dikes and intrusive sills at no great depth. To this type the name *intrusive* (or *hypabyssal*) is often given in distinction to the *plutonic* (or *abyssal*) which formed at greater depths. As might be expected, they show structures intermediate between those of the effusive and the plutonic rocks. They are very commonly porphyritic, not rarely vitreous, and sometimes even vesicular. In fact many of them are indistinguishable petrologically from lavas of similar composition.

The attempt to form a special group of hypabyssal (intrusive and dike) rocks has met with much criticism and opposition. Such a group certainly cannot rank as equally important and equally well characterized with the plutonic and the effusive. But there are many kinds of rock which are not found to occur normally in any other manner. As examples we may cite the lamprophyres, the aplites and the porphyrites. These never occur as lava flows or as great plutonic bosses; if magmas of the same composition as these rocks occur in either of these ways they consolidate with different assemblages of minerals and different structures.

Subdivisions of Igneous Rock Class.

In subdividing the plutonic, the hypabyssal and the effusive rocks, the principle is followed of grouping those together which resemble one another in mineral constitution and in chemical composition. In a broad sense these two properties are interdependent.

[1] Idiomorphic, having its own characteristic form, Gr. ἴδιος, belonging to one's self, (αὐτός), μορφή (form); allotriomorphic, from Gr. ἀλλότριος, belonging to another (ἄλλος), a stranger (ξένος).

Chemical Characters.

The commoner rock constituents are nearly all oxides; chlorine, sulphur and fluorine are the only important exceptions to this and their total amount in any rock is usually much less than 1 %. F. W. Clarke has calculated that a little more than 47 % of the earth's crust consists of oxygen. It occurs principally in combination as oxides, of which the chief are silica, alumina, iron oxides, lime, magnesia, potash and soda. The silica functions principally as an acid, forming silicates, and all the commonest minerals of igneous rocks are of this nature. From a computation based on 1672 analyses of all kinds of rocks Clarke arrived at the following as the average percentage composition: SiO_2 59·71, Al_2O_3 = 15·41, Fe_2O_3 = 2·63, FeO = 3·52, MgO = 4·36, CaO = 4·90, Na_2O = 3·55, K_2O = 2·80, H_2O = 1·52, TiO_2 = 0·60, P_2O_5 = 0·22, total 99·22%. All the other constituents occur only in very small quantities, usually much less than 1%.

These oxides do not combine in a haphazard way. The potash and soda, for example, with a sufficient amount of alumina and silica, combine to produce feldspars. In some cases they may take other forms, such as nepheline, leucite and muscovite, but in the great majority of instances they are found as feldspar. The phosphoric acid with lime forms apatite. The titanium dioxide with ferrous oxide gives rise to ilmenite. Part of the lime forms lime feldspar. Magnesia and iron oxides with silica crystallize as olivine or enstatite, or with alumina and lime form the complex ferro-magnesian silicates, of which the pyroxenes, amphiboles and biotites are the chief. Any excess of silica above what is required to neutralize the bases will separate out as quartz; excess of alumina crystallizes as corundum. These must be regarded only as general tendencies, which are modified by physical conditions in a manner not as yet understood. It is possible by inspection of a rock analysis to say approximately what minerals the rock will contain, but there are numerous exceptions to any rule which can be laid down.

Mineral Constitution.

Hence we may say that except in acid or siliceous rocks containing 66 % of silica and over, quartz will not be abundant. In basic rocks (containing 60 % silica or less) it is rare and accidental. If magnesia and iron be above the average while silica is low olivine may be expected; where silica is present in greater quantity other ferro-magnesian minerals, such as augite, hornblende, enstatite or biotite, occur rather than olivine. Unless potash is high and silica relatively low leucite will not be present, for leucite does not occur with free quartz. Nepheline, likewise, is usually found in rocks with much soda and comparatively little silica. With high alkalis soda-bearing pyroxenes and amphiboles may be present. The lower the percentage of silica and the alkalis the greater is the prevalence of lime feldspar as contracted with soda or potash feldspar. Clarke has calculated the relative abundance of the principal rock-forming minerals with the following results: Apatite = 0·6, titanium minerals = 1·5, quartz = 12·0, feldspars = 59·5, biotite = 3..., hornblende and pyroxene = 16·8, total = 94·2%. This, however, can only be a rough approximation. The other determining factor, namely the physical conditions attending consolidation, plays on the whole a smaller part, yet is by no means negligible, as a few instances will prove. There are certain minerals which are practically confined to deep-seated intrusive rocks, *e.g.* microcline, muscovite, diallage. Leucite is very rare in plutonic masses; many minerals have special peculiarities in microscopic character according to whether they crystallized in depth or near the surface, *e.g.* hypersthene, orthoclase, quartz. There are some curious instances of rocks having the same chemical composition but consisting of entirely different minerals, *e.g.* the hornblendite of Gran, in Norway, containing only hornblende, has the same composition as some of the camptonites of the same locality which contain feldspar and hornblende of a different variety. In this connexion we may repeat what has been said above about the corrosion of porphyritic minerals in igneous rocks. In rhyolites and trachytes early crystals of hornblende and biotite may be found in great numbers partially converted into augite and magnetite. The hornblende and biotite were stable under the pressures and other conditions which obtained below the surface, but unstable at higher levels. In the ground-mass of these rocks augite is almost universally present. But the plutonic representatives of the same magma, granite and syenite contain biotite and hornblende far more commonly than augite.

Acid, Intermediate and Basic Igneous Rocks.

Those rocks which contain most silica and on crystallizing yield free quartz are erected into a group generally designated the "acid" rocks. Those again which contain least silica and most magnesia and iron, so that quartz is absent while olivine is usually abundant, form the "basic" group. The "intermediate" rocks include those which are characterized by the general absence of both quartz and olivine. An important subdivision of these contains a very high percentage of alkalis, especially soda, and consequently has minerals such as nepheline and leucite not common in other rocks. It is often separated from the others as the "alkali" or "soda" rocks, and there is a corresponding series of basic rocks. Lastly a small sub-group rich in olivine and without feldspar has been called the "ultrabasic" rocks. They have very low percentages of silica but much iron and magnesia.

Except these last practically all rocks contain feldspars or feldspathoid minerals. In the acid rocks the common feldspars are orthoclase, with perthite, microcline, oligoclase, all having much silica and alkalis. In the basic rocks labradorite, anorthite and bytownite prevail, being rich in lime and poor in silica, potash and soda. Augite is the commonest ferro-magnesian of the basic rocks, but biotite and hornblende are on the whole more frequent in the acid.

The rocks which contain leucite or nepheline, either partly or wholly replacing feldspar are not included in this table. They are essentially of intermediate or of basic character. We might in consequence regard them as varieties of syenite, diorite, gabbro, &c.,

	Acid.	Intermediate.		Basic.	Ultrabasic.
Commonest Minerals.	Quartz Orthoclase (and Oligoclase), Mica, Hornblende, Augite.	Little or no Quartz. Orthoclase Hornblende, Augite, Biotite.	Plagioclase Hornblende, Augite, Biotite.	No Quartz Plagioclase Augite, Olivine.	No Feldspar Augite, Hornblende, Olivine.
Plutonic or Abyssal type.	Granite.	Syenite.	Diorite.	Gabbro.	Peridotite.
Intrusive or Hypabyssal type.	Quartz-porphyry.	Orthoclase-porphyry.	Porphyrite.	Dolerite.	Picrite.
Lavas or Effusive type.	Rhyolite, Obsidian.	Trachyte.	Andesite.	Basalt.	Limburgite.

in which feldspathoid minerals occur, and indeed there are many transitions between syenites of ordinary type and nepheline—or leucite—syenite, and between gabbro or dolerite and theralite or essexite. But as many minerals develop in these "alkali" rocks which are uncommon elsewhere, it is convenient in a purely formal classification like that which is outlined here to treat the whole assemblage as a distinct series.

Nepheline and Leucite-bearing Rocks.

Commonest Minerals.	Alkali Feldspar, Nepheline or Leucite, Augite, Hornblende, Biotite.	SodaLimeFeldspar Nepheline or Leucite, Augite, Hornblende (Olivine).	Nepheline or Leucite, Augite, Hornblende, Olivine.
Plutonic type.	Nepheline-syenite. Leucite-syenite.	Essexite and Theralite.	Ijolite and Missourite.
Intrusive type.	Nepheline-porphyry.		
Effusive type or Lavas.	Phonolite, Leucitophyre.	Tephrite and Basanite.	Nepheline-basalt. Leucite-basalt.

This classification is based essentially on the mineralogical constitution of the igneous rocks. Any chemical distinctions between the different groups, though implied, are relegated to a subordinate position. It is admittedly artificial but it has grown up with the growth of the science and is still adopted as the basis on which more minute subdivisions are erected. The subdivisions are by no means of equal value. The syenites, for example, and the peridotites, are far less important than the granites, diorites and gabbros. Moreover, the effusive andesites do not always correspond to the plutonic diorites but partly also to the gabbros. As the different kinds of rock, regarded as aggregates of minerals, pass gradually into one another, transitional types are very common and are often so important as to receive special names. The quartz-syenites and nordmarkites may be interposed between granite and syenite, the tonalites and adamellites between granite and diorite, the monzonites between syenite and diorite, norites and hyperites between diorite and gabbro, and so on.

There is of course a large number of recognized rock species not included in the tables given. These are of two kinds, either belonging to groups which are subdivisions of those enumerated (bearing the same relation to them that species do to genera) or rare and exceptional rocks that do not fall within any of the main subdivisions proposed. The question may be asked—When is a rock entitled to be recognized as belonging to a distinct species or variety and deserving a name for itself? It must, first of all, be proved to occur in considerable quantity at some locality, or better still at a series of localities or to have been produced from different magmas at more than one period of the earth's history. In other words, it must not be a mere anomaly. Moreover, it should have a distinctive mineral constitution, differing from other rocks, or something individual in the characters of its minerals or of its structures. It is often surprising how peculiar types of rock, believed at first

to be unique, turn up with identical features in widely scattered regions, *alnöite*, for example, occurs in Norway, Scotland, Montreal, British Columbia, New York and Brazil, *tinguaite* in Scotland, Norway, Brazil, Montana, Portugal, &c. This indicates that underlying all the variations in mineralogical, structural and chemical properties there are definite relationships which tend to repeat themselves, producing the same types whenever the same conditions are present.

Although in former years the view was widely current, especially in Germany, that igneous rocks belonging to different geological epochs should receive different names, it is now admitted on all sides that this cannot be upheld.

In 1902 a group of American petrographers brought forward a proposal to discard all existing classifications of igneous rocks and to substitute for them a "quantitative" classification based on chemical analysis. They showed how vague and often unscientific was much of the existing terminology and argued that as the chemical composition of an igneous rock was its most fundamental characteristic it should be elevated to prime position. Geological occurrence, structure, mineralogical constitution, the hitherto accepted criteria for the discrimination of rock species were relegated to the background. The completed rock analysis is first to be interpreted in terms of the rock-forming minerals which might be expected to be formed when the magma crystallizes, *e.g.* quartz feldspars of various kinds, olivine, akermannite, feldspathoids, magnetite, corundum and so on, and the rocks are divided into groups strictly according to the relative proportion of these minerals to one another. There is no need here to describe the minutia of the process adopted as the authors have stated them very clearly in their treatise (*Quantitative Classification of Igneous Rocks*, Chicago, 1902), and there is no indication that even in the United States it will ever displace the older classifications.

Consanguinity.

We can often observe in a series of eruptives belonging to one period and a restricted area certain features which distinguish them as a whole more or less completely from other similar assemblages. Such groups are often said to be consanguineous, and to characterize a definite "petrological province." Excellent examples of this are furnished by the Devonian igneous rocks of southern Norway as described by Brögger, the Tertiary rocks of the Hebrides (Harker), the Italian lavas studied by H. S. Washington. On a larger scale the volcanoes which girdle the Pacific (Andes, Cordillera, Japan, &c.), and those which occur on the volcanic islands of the Atlantic, show the same phenomena. Each of these groups has been formed presumably from a single deep-seated magma or source of supply and during a period which while necessarily prolonged was not of vast duration in a geological sense.

Differentiation.

On the other hand, each of the great suites of eruptive rocks which constitute such a petrological province embraces a great range of types. Prolonged eruptions have in a few cases a somewhat monotonous character, owing to the predominance of one kind of rock. Thus the lavas of the Hawaiian Islands are mostly basaltic, as are those of Oregon, Washington and the Deccan, all of which form geological masses of enormous magnitude. But it is more usual to find basalts, andesites, trachytes, dacites and many other rocks occurring in a single eruptive complex. The process by which a magma splits up into a variety of partial products is known as "differentiation." Its importance from the standpoint of theoretical petrology is very great, but as yet no adequate explanation of it has been offered. Differentiation may show itself in two ways. In the first type the successive emissions from a volcanic focus may differ considerably from one another. Thus in the Pentland Hills, near Edinburgh, the lavas which are of lower Devonian age, were first basaltic, then andesitic, trachytic and dacitic, and finally rhyolitic, and this succession was repeated a second time. Yet they all must have come from the same focus, or at any rate from a group of foci very closely connected with one another. Occasionally it is found that the earlier lavas are of intermediate character and that basic alternate with acid during the later stages of the volcanic history.

Not less interesting are those cases in which a single body of rock has in consolidation yielded a variety of petrographical types often widely divergent. This is best shown by great plutonic bosses which may be regarded as having once been vast subterranean spaces filled with a nearly homogeneous liquid magma. Cooling took place gradually from the outer surfaces where the igneous rock was in contact with the surrounding strata. The resultant laccolite (Gr. λάκκος, pit, crater, λίθος, stone), stock or boss, may be a few hundred yards or many miles in diameter and often contains a great diversity of crystalline rocks. Thus peridotite, gabbro, diorite, tonalite and granite, are often associated, usually in such a way that the more basic are the first-formed and lie nearest the external surfaces of the mass. The reverse sequence occurs occasionally, the edges being highly acid while the central parts consist of more basic rocks. Sometimes the later phases penetrate into and vein the earlier; evidently there has been some movement due to temporary increase of pressure when part of the laccolite was solid and part still in a liquid state. This links these phenomena with those above described where successive emissions of different character have proceeded outwards from the focus.

According to modern views two explanations of these facts are possible. Some geologists hold that the different rock facies found in association are often due to local absorption of surrounding rocks by the molten magma ("assimilation"). Effects of this kind are to be expected, and have been clearly proved in many places. There is, however, a general reluctance to admit that they are of great importance. The nature and succession of the rock species do not as a rule show any relation to the sedimentary or other materials which may be supposed to have been dissolved; and where solution is known to have gone on the products are usually of abnormal character and easily distinguishable from the common rock types.

Hence it is generally supposed that differentiation is to be ascribed to some physical or chemical processes which lead to the splitting up of a magma into dissimilar portions, each of which consolidates as a distinct kind of rock. Two factors can be selected as probably most potent. One important factor is cooling and another is crystallization. According to physico-chemical laws the least soluble substances will tend to diffuse towards the cooling surfaces (Ludwig-Soret's principle). This is in accordance with the majority of the observed facts and is probably a *vera causa* of differentiation, though what its potency may be is uncertain. As a rock solidifies the minerals which crystallize follow one another in a more or less well-defined order, the most basic (according to Rosenbusch's law) being first to separate out. That in a general way the peripheral portions of a laccolite consist mainly of those early basic minerals suggests that the sequence of crystallization helps largely in determining the succession (and consequently the distribution of rock species in a plutonic complex). Gravity also may play a part, for it is proved that in a solution at rest the heaviest components will be concentrated towards the base. This must, however, be of secondary importance as in laccolites the top portions often consist of more basic and heavier varieties of rock than the centres. It has also been argued that the earliest minerals being heaviest and in any case denser than the fused magma around them, will tend to sink by their own weight and to be coogregated near the bottom of the mass. Electric currents, magnetic attraction and convection currents have also been called in to account for the phenomena observed. Magmas have also been compared to liquids which, when they cool, split up into portions no longer completely soluble in one another (liquation hypothesis). Each of these partial magmas may dissolve a portion of the others and as the temperature falls and the conditions change a range of liquids differing in composition may be supposed to arise.

All igneous magmas contain dissolved gases (steam, carbonic acid, sulphuretted hydrogen, chlorine, fluorine, boric acid, &c.). Of these water is the principal, and was formerly believed to have percolated downwards from the earth's surface to the heated rocks below, but is now generally admitted to be an integral part of the magma. Many peculiarities of the structure of the plutonic rocks as contrasted with the lavas may reasonably be accounted for by the operation of these gases, which were unable to escape as the deep-seated masses slowly cooled, while they were promptly given up by the superficial effusions. The acid plutonic or intrusive rocks have never been reproduced by laboratory experiments, and the only successful attempts to obtain their minerals artificially have been those in which special provision was made for the retention of the "mineralizing" gases in the crucibles or sealed tubes employed. These gases often do not enter into the composition of the rock-forming minerals, for most of these are free from water, carbonic acid, &c. Hence as crystallization goes on the residual liquor must contain an ever-increasing proportion of volatile constituents. It is conceivable that in the final stages the still uncrystallized part of the magma has more resemblance to a solution of mineral matter in superheated steam than to a dry igneous fusion. Quartz, for example, is the last mineral to form in a granite. It bears much of the stamp of the quartz which we know has been deposited from aqueous solution in veins, &c. It is at the same time the most infusible of all the common minerals of rocks. Its late formation shows that in this case it arose at comparatively low temperatures and points clearly to the special importance of the gases of the magma as determining the sequence of crystallization.

When solidification is nearly complete the gases can no longer be retained in the rock and make their escape through fissures towards the surface. They are powerful agents in attacking the minerals of the rocks which they traverse, and instances of their operation are found in the kaolinization of granites, tourmalinization and formation of greisen, deposit of quartz veins, stanniferous and auriferous veins, apatite veins, and the group of changes known as propylitization.[1] These "pneumatolytic" (Gr. πνεῦμα, spirit, vapour, λύειν, to loose, dissolve) processes are of the first importance in the genesis of many ore deposits. They are a real part of the history of the magma itself and constitute the terminal phases of the volcanic sequence.

The complicated succession from basic (or ultrabasic) to acid types exemplified in the history of many magmas is reflected with

[1] The term "propylite" (Gr. πρόπυλον, a gateway) was given by Richthofen to a volcanic rock which is supposed to have marked a new epoch in volcanic geology (see ANDESITE).

astonishing completeness in the history of individual products. In each class of rock crystallization follows a definite course. The first minerals to separate belong to a group known as the minor accessories; this includes zircon, apatite, sphene, iron oxides; then follow in order olivine, augite, hornblende, biotite, plagioclase, feldspar (beginning with the varieties most rich in lime and ending with those which contain most soda), orthoclase, microcline and quartz (with micropegmatite). Many exceptions to this rule are known; the same mineral may crystallize at two different periods; two or more minerals may crystallize simultaneously or the stages in which they form may overlap. But the succession above given holds in the vast majority of cases. Expressed in this way: the more basic minerals precede the less basic; it is known as Rosenbusch's law.

Sequence of Crystallization.

Types of Structure.—In some rocks there seems to be little tendency for the minerals to envelop one another. This is true of many gabbros, aplites and granites (Plate III. fig. 7). The grains then lie side by side, with the faces of the latter moulded on or adapted to the more perfect crystalline outlines of the earlier. More commonly some closer relationship exists between them. When the smaller idiomorphic crystals of the first-formed are scattered irregularly through the larger and less perfect crystals of later origin, the structure is said to be poikilitic (Gr. ποικίλος, many-coloured, mottled). A variety of this, known as ophitic (Plate III. fig. 6), is very characteristic of many dolerites and diabases, in which large plates of augite enclose many small laths of plagioclase feldspar. Biotite and hornblende frequently enclose feldspar ophitically; less commonly iron oxides and sphene do so. In peridotites the "lustre-mottled" structure arises from pyroxene or hornblende enveloping olivine in the same manner (Plate III. fig. 8). In these cases no crystallographic relation exists between the two minerals (enclosing and enclosed).

Poikilitic.

But often the surrounding mineral has been laid down on the surface of the other in such a way that they have certain crystalline faces or axes parallel to one another. This is known as "parallel growth." It is best seen in zoned crystals of plagioclase feldspar, which may range in composition from anorthite to oligoclase, the more acid layers being deposited regularly on the surfaces of the more basic. Biotite and muscovite, hornblende and augite, enstatite and diallage, epidote and orthite, very frequently are associated in this way.

Parallel Growths.

When two minerals crystallize simultaneously they may be intergrown in "graphic" fashion. The best example is quartz and orthoclase occurring together as micropegmatite (Plate II. figs. 6 and 8). The quartz forms angular patches in the feldspar, which though separated have the same crystalline orientation and one position of extinction, while the feldspar on its part behaves in the same way. Two porous crystals thus interpenetrate but the scattered parts of each mineral maintain their connexion with the others. There may be also a definite relation between the crystalline axes of the two crystals, though this is not known in all cases. Augite also occurs in graphic intergrowth with hornblende, olivine and feldspar; and hornblende, cordierite, epidote and biotite in graphic intergrowth with quartz.

Graphic Intergrowths.

Physical Chemistry of Igneous Rocks.—The great advances that have been made in recent years in our knowledge of physical chemistry have very important bearings on petrological investigations. Especially in the study of the genesis of igneous rocks we anticipate that by this means much light will be thrown on problems which are now very obscure and a complete revolution in our ideas of the conditions which affect crystallization may yet be the consequence. Already many important results have been gleaned. As yet little work of an exact and quantitative nature has been done on actual rocks or on mixtures resembling them in composition, but at the Carnegie Institution in Washington, an elaborate series of experiments in the synthesis of minerals and the properties of mixtures of these is being carried on, with all the refinements which modern science can suggest. The work of Doelter and of Vogt may also be mentioned in this connexion. At the same time the mathematical theory of the physical processes involved has received much attention, and serves both to direct and to elucidate the experimental work.

A fused mixture of two minerals may be regarded as a solution of one on the other. If such a solution be cooled down, crystallization will generally set in and if the two components be independent (or do not form mixed crystals) one of them may be expected to start crystallizing. On further cooling, more of this mineral will separate out till at last a residue is left which contains the two components in definite proportions. This mixture, which is known as the eutectic mixture, has the lowest melting-point of any which can be formed from these minerals. If heat be still abstracted the eutectic will consolidate as a whole; its two mineral components will crystallize simultaneously. At any given pressure the composition of the eutectic mixture in such a case is always the same.

Magmas as Solutions.

Similarly, if there be three independent components (none of which forms mixed crystals with the others), according to their relative amounts and to the composition of the eutectic mixture one will begin to crystallize; then another will make its appearance in solid form, and when the excess of these has been removed, the ternary eutectic (that mixture of the three which has the lowest melting-point) will be produced and crystallization of all three components will go on simultaneously.

These processes have without doubt a very close analogy to the formation of igneous rocks. Thus in certain felsites or porphyries which may be considered as being essentially mixtures of quartz and feldspar, a certain amount of quartz has crystallized out at an early period in the form of well-shaped porphyritic crystals, and thereafter the remainder of the rock has solidified as a very fine-grained, cryptocrystalline or sometimes micrographic ground-mass which consists of quartz and feldspar in intimate intermixture. The latter closely resembles a eutectic, and chemical studies have proved that within somewhat narrow limits the composition of these felsitic ground-masses is constant.

But the comparison must not be pushed too far, as there are always other components than quartz and feldspar (apatite, zircon, biotite and iron oxides being the most common), and in rocks of this type the gases dissolved in the magma play a very important part. As crystallization goes on, these gases are set free and their pressure must increase to some extent. Moreover, the feldspar is not one mineral but two or perhaps three, there being always soda feldspar and potash feldspar and usually also a small amount of lime feldspar in these porphyries.

In a typical basic rock the conditions are even more complex. A dolerite, for example, usually contains, as its last products of crystallization, pyroxene and feldspar. Of these the latter consists of three distinct species, the former of an unknown number; and in each case they can form mixed crystals, to a greater or less extent with one another. From these considerations it will be clear that the properties of solutions of two or three independent components, do not necessarily explain the process of crystallization in any igneous rock.

Very frequently in porphyries not only quartz but feldspar also is present in large well-formed early crystals. Similarly in basalts, augite and feldspar may appear both as phenocrysts and as components of the ground-mass. As an explanation of this it has been suggested that supersaturation has taken place. We may suppose that the augite which was in excess of the proportion necessary to form the feldspar-augite, eutectic mixture, first separated out. When the remaining solution reached the eutectic composition the feldspar did not at once start crystallizing, perhaps because nuclei are necessary to initiate crystal-growth and these were not at hand; augite went on crystallizing while feldspar lagged behind. Then feldspar began and as the mixture was now supersaturated with that mineral a considerable amount of it was rapidly thrown out of the solution. At the same time there would be a tendency for part of the augite, already crystallized, to be dissolved and its crystals would be corroded, losing their sharp and perfect edges, as is often observed in rocks of this group. When the necessary adjustments had been made the eutectic mixture would be established and thereafter the two minerals would consolidate simultaneously (or nearly so) till crystallization was complete.

There is a good deal of evidence to show that supersaturation is not unimportant in igneous magmas. The frequency with which they form glasses proves that under certain conditions the molten rocks are highly viscous. Much will depend also on the presence, accidental or otherwise, of nuclei on which a mineral substance can be deposited. It is known that minerals differ in their tendency to crystallize, some doing so very readily while others are slow and backward. The rate at which crystallization goes on depends on many factors, and there are remarkable differences in this respect between minerals.

On the other hand, there is plenty of evidence to show that supersaturation, though probably one of the causes, is not the principal cause of the appearance of more than one mineral in two generations of crystals. In some of the quartz-porphyries, for example, there are phenocrysts not only of quartz and feldspar but also of micropegmatite. These prove that quartz and feldspar were not crystallizing successively or alternately but simultaneously.

The great majority of the minerals found in igneous rocks are not of simple composition, but are mixtures of various elementary minerals in very different proportions. This enormously complicates the theoretical problems of consolidation. It has been found, for example, that in the case of three minerals—one of which is independent, while the two others can form mixed crystals—there is a large number of possible sequences; and, what is very important, one mineral may separate out entirely at an early stage, or its crystallization may be interrupted and not continuous. The ternary eutectic, which is produced by a mixture of three independent minerals, may not in such a case be the last substance to crystallize, and may not be present at all. This is very much in accordance with the observed facts of petrology; for usually in a rock there is one mineral which indubitably was the last of all to finish crystallizing and contained no appreciable quantity of the others.

As yet we know little about such important questions as the composition of the eutectic mixtures of rock-minerals, their latent heat of fusion, specific heats, mutual solubilities, inversion temperatures, &c. Until we are in possession of a large body of accurate information on such points as these the theoretical treatment of

the processes involved in the formation of igneous rocks cannot be successfully handled. But every day sees an increase in the amount of data available, and encourages us to believe that sooner or later some of the simpler igneous rocks at any rate will be completely explicable on physico-chemical principles.

Rock masses of igneous origin have no sooner consolidated than they begin to change. The gases with which the magma is charged are slowly dissipated, lava-flows often remain hot and steaming for many years. These gases attack the components of the rock and deposit new minerals in cavities and fissures. The beautiful zeolites, so well known to collectors of minerals, are largely of this origin. Even before these "post-volcanic" processes have ceased atmospheric decomposition begins. Rain, frost, carbonic acid, oxygen and other agents operate continuously, and do not cease till the whole mass has crumbled down and most of its ingredients have been resolved into new products. In the classification of rocks these secondary changes are generally considered unessential; rocks are classified and described as if they were ideally fresh, though this is rarely the case in nature.

Post-volcanic Changes.

Epigenitic change (secondary processes) may be arranged under a number of headings, each of which is typical of a group of rocks or rock-forming minerals, though usually more than one of these alterations will be found in progress in the same rock. Silicification, the replacement of the minerals by crystalline or crypto-crystalline silica, is most common in acid rocks, such as rhyolite, but is also found in serpentine, &c. Kaolinization is the decomposition of the feldspars, which are the commonest minerals of igneous rocks, into kaolin (along with quartz, muscovite, &c.); it is best shown by granites and syenites. Serpentinization is the alteration of olivine to serpentine (with magnetite); it is typical of peridotites, but occurs in most of the basic rocks. In uralitization secondary hornblende replaces augite; this occurs very generally in diabases; chloritization is the alteration of augite (biotite or hornblende) to chlorite, and is seen in many diabases, diorites and greenstones. Epidotization occurs also in rocks of this group, and consists in the development of epidote from biotite, hornblende, augite or plagioclase feldspar.

Secondary Changes.

The *sedimentary rocks*, which constitute the second great group, have many points in common that distinguish them from the igneous and the metamorphic. They have all originated on the surface of the earth, and at the period of their formation were exposed only to the temperature of the air and to atmospheric pressure (or the pressures which exist at the bottoms of seas and lakes). Their minerals are in most cases not susceptible to change when exposed to moist air or sea, and many of them are hydrated (chlorite, micas, &c.), or oxidized (iron ores), or contain carbonic acid (calcite, dolomite). The extent, however, to which this is the case depends largely on the rapidity with which they have accumulated; coarse rocks quickly piled up often consist of materials only partly weathered. When crystalline, the sedimentary rocks are usually soluble at low temperatures. The members of this group occur in beds or strata, hence they are often known as the stratified rocks; the upper beds are always of later formation than those which underlie them, except (as may happen when great disturbance has taken place) the whole series is inverted or overturned. Many of the stratified rocks have been formed by the agency of moving water (rivers, currents, &c.) and are grouped together as "aqueous" rocks; others have been deposited by the wind in deserts, on sandy beaches, &c. (these are "aeolian"). Others are the remains of animals or of plants, modified by the action of time, pressure and percolating water. Lastly, we find beds of crystalline nature, such as rock-salt and gypsum, which have been formed by the desiccation of saline waters; other crystalline stratified rocks, such as dolomite and many bedded iron-stones, are replacement products due to the introduction of mineral matter in solution, which replaced the original rock mass partially or wholly.

When the rocks exposed at the earth's surface give way before the attack of the agencies of denudation, they crumble down and are resolved into two parts. One of these consists of solid material (sand, clay and angular débris) insoluble in carbonated waters; the other part is dissolved and washed away. The undissolved residues, when they finally come to rest, form *clastic* sedimentary rocks (sandstone, conglomerate, shale, &c.). The dissolved portions are partly transferred to the sea, where they help to increase its store of salts, and may again be precipitated as *crystalline* sedimentary rocks; but they are also made use of by plants and by animals to form their skeletal and vital tissues. From this latter portion the rocks of *organic* origin are built up. These may also contain certain ingredients derived from the atmosphere (nitrogen, carbon in coals, &c.).

We have thus three types of sediments of distinct origin, which may be named the clastic (or fragmental), the crystalline and the organic.

The clastic materials may accumulate *in situ*, and then differ chiefly in their disintegrated and weathered state from the parent rock masses on which they rest. The best example of these are the soils, but in elevated regions angular broken rock often covers large areas. More usually they are transported by wind or water, and become sorted out according to their size and density. The coarsest débris comes first to rest and is least worn and weathered; it includes screes, gravels, coarse sands, &c., and consolidates as conglomerates, breccias and pebbly grits. The bedding of these rocks is rudimentary and imperfect, and as each bed is traced along its outcrop it frequently changes its character with the strata on which it rests. The most finely divided sediment travels farthest, and is laid down in thin uniform sheets of wide extent. It is known as mud and clay; around the shores of our continents, at distances of a hundred miles and more from land, great sheets of mud are spread over the ocean floors. This mud contains minute particles of quartz and of feldspar, but consists essentially of finely divided scaly minerals, which by their small size and flat shape tend to remain suspended in water for a very long time. Chlorite, white micas and kaolin are the best examples of this class of substances. Wind action is even more effective than water in separating and removing these fine particles. They to a very large extent escape mechanical attrition, because they are transported in suspension and are not swept along the ground or the bottom of the sea; hence they are mostly angular. Fragments of intermediate magnitudes (from $\frac{1}{100}$ of an inch to $\frac{1}{4}$ of an inch) are classed as sands. They consist largely of quartz, because it does not weather into scaly minerals like feldspar, and having but a poor cleavage does not split up into flakes like mica or chlorite. These quartz grains have been rolled along and are usually rounded and worn (Plate IV. fig. 1). More or less of garnet feldspar, tourmaline, zircon, rutile, &c., are mixed with the quartz, because these are hard minerals not readily decomposed.

Clastic.

The mechanical sorting by the transporting agencies is usually somewhat incomplete, and mixed types of sediment result, such as gravels containing sand, or clays with coarser arenaceous particles. Moreover, successive layers of deposit may not always be entirely similar, and alternations of varying composition may follow one another in thin laminae: *e.g.* laminae of arenaceous material in beds of clay and shale. Organic matter is frequently mingled with the finer-grained sediments.

These three types have been named the psephitic (or pebbly; Gr. ψῆφος, pebble); psammitic (or sandy, Gr. ψάμμος, sand), and pelitic (or muddy: Gr. πηλός, mud).

Two groups of clastic sediments deserve special treatment. The pyroclastic (Gr. πῦρ, fire, and κλαστός, broken) rocks of volcanic origin, consist mostly of broken pieces of lava (bombs, ash, &c.) Plate IV. fig. 2), and only accidentally contain other rocks or fossils. They are stratified, and may be coarse or fine, but are usually much less perfectly sorted out, according to their fineness, than ordinary aqueous or aeolian deposits. The glacial clays (boulder clays), representing the ground moraines of ancient glaciers and ice sheets, are characterized by the very variable size of their ingredients and the striated, blunted sub-angular form of the larger rock fragments. In them stratification is exceptional and fossils are very rare.

The crystalline sedimentary rocks have been deposited from solution in water. The commonest types, such as rock-salt, gypsum, anhydrite, carnallite, are known to have arisen by the evaporation of enclosed saline lakes exposed to a dry atmosphere. They occur usually in beds with layers of red clay and marl; some limestones have been formed by calcareous waters containing carbonate of lime dissolved in an excess of carbonic acid; with the escape of the volatile gas the mineral matter is precipitated (sinters, *Sprudelstein*, &c.). Heated waters on cooling may yield up part of their dissolved mineral substances; thus siliceous sinters are produced around geysers and hot springs in many parts of the world. There seems no reason to separate from these the veinstones which fill the fissures by which these waters rise to the surface. They differ from those above enumerated in being more perfectly crystallized and in having no definite stratification, but only a banding parallel to the more or less vertical walls of the fissure. Another subdivision of this class of rocks is due to recrystallization or crystalline replacement of pre-existing sediments. Thus limestones are dolomitized or converted into ironstones, flints and cherts, by percolating waters which remove the lime salts and substitute for them compounds of iron, magnesia, silicon, and so on. This may be considered a kind of metamorphism; it is generally known as metasomatism (*q.v.*).

Crystalline.

The rocks of organic origin may be due to animals or plants. They are of great importance, as limestones and coals belong to this group. They are the most fossiliferous of all rocks; but clastic sediments are often rich in fossils though crystalline sediments rarely are. They may be subdivided, according to their dominant components, into calcareous,

Organic.

carbonaceous, siliceous, ferruginous, and so on. The calcareous organic rocks may consist principally of foraminifera, crinoids, corals, brachiopoda, mollusca, polyzoa, &c. Most of them, however, contain a mixture of organisms. By crystallization and metasomatic changes they often lose their organic structures; metamorphism of any kind has the same effect. The carbonaceous rocks are essentially plant deposits; they include peat, lignite and coal. The siliceous organic rocks include radiolarian and diatom oozes; in the older formations they occur as radiolarian cherts. Flint nodules owe their silica to disseminated fossils of this nature which have been dissolved and redeposited by concretionary action. Some kinds of siliceous sinter may be produced by organisms inhabiting hot silicated waters. Calcareous oolites in the same way may have arisen through the agency of minute plants. Bog iron ores also may be of organic rather than of merely chemical origin. The phosphatic rocks so extensively sought after as sources of fertilizing agents for use in agriculture are for the most part of organic origin, since they owe their substance to the remains of certain varieties of animals which secrete a phosphatic skeleton; but most of them no longer show organic structures but have been converted into nodular or concretionary forms.

Cementation.

All sediments are at first in an incoherent condition (*e.g.* sands, clays and gravels, beds of shells, &c.), and in this state they may remain for an indefinite period. Millions of years have elapsed since some of the early Tertiary strata gathered on the ocean floor, yet they are quite friable (*e.g.* the London Clay) and differ little from many recent accumulations. There are few exceptions, however, to the rule that with increasing age sedimentary rocks become more and more indurated, and the older they are the more likely it is that they will have the firm consistency generally implied in the term "rock." The pressure of newer sediments on underlying masses is apparently one cause of this change, though not in itself a very powerful one. More efficiency is generally ascribed to the action of percolating water, which takes up certain soluble materials and redeposits them in pores and cavities. This operation is probably accelerated by the increased pressure produced by superincumbent masses, and to some extent also by the rise of temperature which inevitably takes place in rocks buried to some depth beneath the surface. The rise of temperature, however, is never very great; we know more than one instance of sedimentary deposits which have been buried beneath four or five miles of similar strata (*e.g.* parts of the Old Red Sandstone), yet no perceptible difference in condition can be made out between beds of similar composition at the top of the series and near its base. The redeposited cementing material is most commonly calcareous or siliceous. Limestones, which were originally a loose accumulation of shells, corals, &c., become compacted into firm rock in this manner; and the process often takes place with surprising ease, as for example in the deeper parts of coral reefs, or even in wind-blown masses of shelly sand exposed merely to the action of rain. The cementing substance may be regularly deposited in crystalline continuity on the original grains, where these were crystalline; and even in sandstones (such as Kentish Rag) a crystalline matrix of calcite often envelopes the sand grains. The change of aragonite to calcite and of calcite to dolomite, by forming new crystalline masses in the interior of the rock, usually also accelerates consolidation. Silica is less easily soluble in ordinary waters, but even this ingredient of rocks is dissolved and redeposited with great frequency. Many sandstones are held together by an infinitesimal amount of colloid or cryptocrystalline silica; when freshly dug from the quarry they are soft and easily trimmed, but after exposure to the air for some time they become much harder, as their siliceous cement sets and passes into a rigid condition. Others contain fine scales of kaolin or of mica. Argillaceous materials may be compacted by mere pressure, like graphite and other scaly minerals. Oxides and carbonates of iron play a large part in many sedimentary rocks and are especially important as colouring matters. The red sands and

Coloration.

limestones, for example, which are so abundant, contain small amounts of ferric oxide (haematite), which in a finely divided state gives a red hue of all rocks in which it is present. Limonite, on the other hand, makes rocks yellow or brown; oxides of manganese, asphalt and other carbonaceous substances are the cause of the black colour of many sediments. Bluish tints result sometimes from the presence of phosphates or of fluorspar; while green is most frequently seen in rocks which contain glauconite or chlorite.

Metamorphic Rocks.—The *metamorphic* rocks, which form the third great subdivision, are even more varied than the igneous and the sedimentary. They include representatives of nearly all kinds of the other two classes, their common characteristic being that they have all undergone considerable alterations in structure or in mineral composition. The agencies of *metamorphism* (*q.v.*) are of two kinds—thermal and regional. In the former case contact with intrusive igneous masses, such as granite, laccolites or dikes, have indurated and recrystallized the original rock. In the second case the actions are more complex and less clearly understood; it is evident that pressure and interstitial movement have had a powerful influence, possibly assisted by rise of temperature. In thermal or contact alteration the rocks are baked, indurated, and often in large measure recrystallized. In regional metamorphism recrystallization also goes on, but the final products are usually schists and gneisses. It is as a rule not difficult to distinguish the two classes of metamorphic rocks at a glance, and they may conveniently be considered separately.

Thermo-metamorphism.

When a rock is contact altered by an igneous intrusion it very frequently becomes harder, more crystalline and more lustrous, owing to the development of many small crystals in its mass. Many altered rocks of this type were formerly called hornstones, and the term *hornfelses* (Ger. *Hornfels*) is often used by geologists to signify those fine grained, compact, crystalline products of thermal metamorphism. A shale becomes a dark argillaceous hornfels, full of tiny plates of brownish biotite; a marl or impure limestone changes to a grey, yellow or greenish lime-silicate-hornfels, tough and splintery, with abundance of augite, garnet, wollastonite and other minerals in which lime is an important component. A diabase or andesite becomes a diabase hornfels or andesite hornfels with a large development of new hornblende and biotite and a partial recrystallization of the original feldspar. A chert or flint becomes a finely crystalline quartz rock; sandstones lose their clastic structure and are converted into a mosaic of small close-fitting grains of quartz.

If the rock was originally banded or foliated (as, for example, a laminated sandstone or a foliated calc-schist) this character may not be obliterated, and a banded hornfels is the product; fossils even may have their shapes preserved, though entirely recrystallized, and in many contact altered lavas the steam cavities are still visible, though their contents have usually entered into new combinations to form minerals which were not originally present. The minute structures, however, disappear, often completely, if the thermal alteration is very profound; thus small grains of quartz in a shale are lost or blend with the surrounding particles of clay, and the fine ground-mass of lavas is entirely reconstructed.

By recrystallization in this manner peculiar rocks of very distinct types are often produced. Thus shales may pass into cordierite rocks, or may show large crystals of andalusite (and chiastolite, Plate IV. fig. 9), staurolite, garnet, kyanite and sillimanite. A considerable amount of mica (both muscovite and biotite) is simultaneously formed, and the resulting product has a close resemblance to many kinds of schist. Limestones, if pure, are often turned into coarsely crystalline marbles (Plate IV. fig. 4); but if there was an admixture of clay or sand in the original rock such minerals as garnet, epidote, idocrase, wollastonite, will be present. Sandstones when greatly heated may change into coarse quartzites composed of large clear grains of quartz. These more intense stages of alteration are not so commonly seen in igneous rocks, possibly because their minerals, being formed at high temperatures, are not so easily transformed or recrystallized.

In a few cases rocks are fused and in the dark glassy product minute crystals of spinel, sillimanite and cordierite may separate out. Shales are occasionally thus altered by basalt dikes, and feldspathic sandstones may be completely vitrified. Similar changes may be induced in shales by the burning of coal seams or even by an ordinary furnace.

There is also a tendency for interfusion of the igneous with the sedimentary rock. Granites may absorb fragments of shale or pieces of basalt. In that case hybrid rocks arise which have not the characters of normal igneous or sedimentary rocks. Such effects are scarce and are usually easily recognized. Sometimes an invading granite magma permeates the rocks around, filling their joints and planes of bedding, &c., with threads of quartz and feldspar. This is very exceptional, but instances of it are known and it may take place on a large scale.

Regional Metamorphism.

The other type of metamorphism is often said to be regional; sometimes it is called dynamic, but these terms have not strictly the same connotation. It may be said as a rule to make the rock more crystalline and at the same time to give it a foliated, schistose or gneissic structure. This latter consists in a definite arrangement of the minerals, so that such as are platy or prismatic (*e.g.* mica and hornblende, which are very common in these rocks) have their longest axes arranged parallel to one another. For that reason many of these rocks split readily in one direction (schists). The minerals also tend to aggregate in bands; thus there are seams of quartz and of mica in a mica schist, very thin, but consisting essentially of one mineral. These seams are called folia (leaflets), and though never very pure or very persistent they give the rock a streaked or banded character when they are seen edgewise (Plate IV. figs. 6, 7, 8). Along the folia composed of the soft or fissile minerals the rocks will sever most readily, and the freshly split specimen will appear to be faced or coated with this mineral; for example, a piece of mica schist looked at facewise might be supposed to consist entirely of shining scales of mica. On the edge of the specimen, however, the white folia of granular quartz

Fig. 1. PHONOLITE, TEPLITZER SCHLOSSBERG, BOHEMIA (× 12).

The large white crystal is felspar, the smaller ones are nepheline having six-sided and four-sided sections. The dark mineral in the ground-mass is aegirine.

Fig. 2.—LEUCITOPHYRE, RIEDEN, EIFFEL, GERMANY (× 15).

A porphyritic clear crystal of leucite lies near the centre of the field; towards the margins are nosean crystals with clear centres and broad black edges. The black spots are aegirine and aegirine-augite, and in the ground-mass small prisms of white nepheline may be seen.

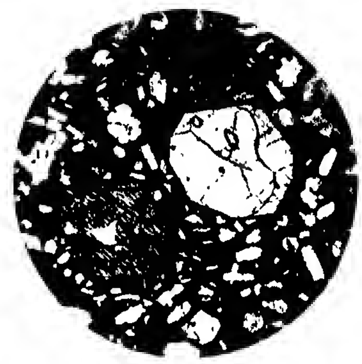

Fig. 3.—LEUCITE-BASANITE, VESUVIUS (× 8).

The rounded central crystal is leucite showing zones of inclusions and well-marked cracks; below it is a dark-brown augite, and olivine occurs near the bottom of the field. There are numerous rectangular white sections of plagioclase felspar. The dark ground-mass is partly vitreous.

Fig. 4.—HYPERSTHENE-ANDESITE, ALWYN, CHEVIOTS, ENGLAND (× 10).

A porphyritic rock with phenocrysts of white plagioclase felspar and of pale-brown augite and hypersthene in a fine ground-mass, partly glassy.

Fig. 5.—OLIVINE-BASALT, CRAIG-LOCKHART, EDINBURGH, SCOTLAND (× 10).

Two large crystals of augite above and below, and of olivine (right and left) lie in a crystalline ground-mass of plagioclase felspar, augite, and magnetite. The olivine has been altered to fibrous green serpentine, and the pseudomorphs show traces of the original cleavage cracks.

Fig. 6.—OPHITIC OLIVINE-DOLERITE, DUN FION, ARRAN, SCOTLAND.

The white mineral is plagioclase felsp which penetrates a large dark crystal augite in ophitic manner. At the bottom the field there are a few grains of olivin colourless, but with strongly-marked crack

Fig. 7.—OLIVINE-GABBRO, VOLPERSDORF, SILESIA (× 10).

Felspar occurs towards the edges of the field and surrounds a cluster of diallage (with strong, dark, parallel lamination) and of olivine (covered with a black network of secondary magnetite).

Fig. 8. PERIDOTITE, ELBA (× 10).

The rounded crystals are olivine, weathering as usual to magnetite and serpentine along its cracks and borders. The dark interstitial substance is enstatite weathered to bastite.

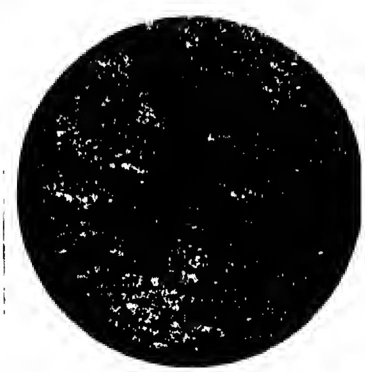

Fig. 9.—SERPENTINE, COLMONELL, AYRSHIRE, SCOTLAND (× 12).

In this rock the process of serpentinizatio seen in the previous figure, is complet No olivine remains, but a meshwork magnetite indicates the position of the crac in the original crystals. The cloudy, da streak ... the centre ... bastite ...

carbonaceous, siliceous, ferruginous, and so on. The calcareous organic rocks may consist principally of foraminifera, crinoids, corals, brachiopoda, mollusca, polyzoa, &c. Most of them, however, contain a mixture of organisms. By crystallization and metasomatic changes they often lose their organic structures; metamorphism of any kind has the same effect. The carbonaceous rocks are essentially plant deposits; they include peat, lignite and coal. The siliceous organic rocks include radiolarian and diatom oozes; in the older formations they occur as radiolarian cherts. Flint nodules owe their silica to disseminated fossils of this nature which have been dissolved and redeposited by concretionary action. Some kinds of siliceous sinter may be produced by organisms inhabiting hot silicated waters. Calcareous oolites in the same way may have arisen through the agency of minute plants. Bog iron ores also may be of organic rather than of merely chemical origin. The phosphatic rocks so extensively sought after as sources of fertilizing agents for use in agriculture are for the most part of organic origin, since they owe their substance to the remains of certain varieties of animals which secrete a phosphatic skeleton; but most of them no longer show organic structures but have been converted into nodular or concretionary forms.

Cementation. All sediments are at first in an incoherent condition (*e.g.* sands, clays and gravels, beds of shells, &c.), and in this state they may remain for an indefinite period. Millions of years have elapsed since some of the early Tertiary strata gathered on the ocean floor, yet they are quite friable (*e.g.* the London Clay) and differ little from many recent accumulations. There are few exceptions, however, to the rule that with increasing age sedimentary rocks become more and more indurated, and the older they are the more likely it is that they will have the firm consistency generally implied in the term "rock." The pressure of newer sediments on underlying masses is apparently one cause of this change, though not in itself a very powerful one. More efficiency is generally ascribed to the action of percolating water, which takes up certain soluble materials and redeposits them in pores and cavities. This operation is probably accelerated by the increased pressure produced by superincumbent masses, and to some extent also by the rise of temperature which inevitably takes place in rocks buried to some depth beneath the surface. The rise of temperature, however, is never very great; we know more than one instance of sedimentary deposits which have been buried beneath four or five miles of similar strata (*e.g.* parts of the Old Red Sandstone), yet no perceptible difference in condition can be made out between beds of similar composition at the top of the series and near its base. The redeposited cementing material is most commonly calcareous or siliceous. Limestones, which were originally a loose accumulation of shells, corals, &c., become compacted into firm rock in this manner; and the process often takes place with surprising ease, as for example in the deeper parts of coral reefs, or even in wind-blown masses of shelly sand exposed merely to the action of rain. The cementing substance may be regularly deposited in crystalline continuity on the original grains, where these were crystalline; and even in sandstones (such as Kentish Rag) a crystalline matrix of calcite often envelopes the sand grains. The change of aragonite to calcite and of calcite to dolomite, by forming new crystalline masses in the interior of the rock, usually also accelerates consolidation. Silica is less easily soluble in ordinary waters, but even this ingredient of rocks is dissolved and redeposited with great frequency. Many sandstones are held together by an infinitesimal amount of colloid or cryptocrystalline silica; when freshly dug from the quarry they are soft and easily trimmed, but after exposure to the air for some time they become much harder, as their siliceous cement sets and passes into a rigid condition. Others contain fine scales of kaolin or of mica. Argillaceous materials may be compacted by mere pressure, like graphite and other scaly minerals. Oxides and carbonates of iron play a large part in many sedimentary rocks and are especially important as colouring matters. The red sands and

Coloration. limestones, for example, which are so abundant, contain small amounts of ferric oxide (haematite), which in a finely divided state gives a red hue of all rocks in which it is present. Limonite, on the other hand, makes rocks yellow or brown; oxides of manganese, asphalt and other carbonaceous substances are the cause of the black colour of many sediments. Bluish tints result sometimes from the presence of phosphates or of fluorspar; while green is most frequently seen in rocks which contain glauconite or chlorite.

Metamorphic Rocks.—The *metamorphic* rocks, which form the third great subdivision, are even more varied than the igneous and the sedimentary. They include representatives of nearly all kinds of the other two classes, their common characteristic being that they have all undergone considerable alterations in structure or in mineral composition. The agencies of *metamorphism* (*q.v.*) are of two kinds—thermal and regional. In the former case contact with intrusive igneous masses, such as granite, laccolites or dikes, have indurated and recrystallized the original rock. In the second case the actions are more complex and less clearly understood; it is evident that pressure and interstitial movement have had a powerful influence, possibly assisted by rise of temperature. In thermal or contact alteration the rocks are baked, indurated, and often in large measure recrystallized. In regional metamorphism recrystallization also goes on, but the final products are usually schists and gneisses. It is as a rule not difficult to distinguish the two classes of metamorphic rocks at a glance, and they may conveniently be considered separately.

Thermo-metamorphism. When a rock is contact altered by an igneous intrusion it very frequently becomes harder, more crystalline and more lustrous, owing to the development of many small crystals in its mass. Many altered rocks of this type were formerly called hornstones, and the term *hornfelses* (Ger. *Hornfels*) is often used by geologists to signify those fine grained, compact, crystalline products of thermal metamorphism. A shale becomes a dark argillaceous hornfels, full of tiny plates of brownish biotite; a marl or impure limestone changes to a grey, yellow or greenish lime-silicate-hornfels, tough and splintery, with abundance of augite, garnet, wollastonite and other minerals in which lime is an important component. A diabase or andesite becomes a diabase hornfels or andesite hornfels with a large development of new hornblende and biotite and a partial recrystallization of the original feldspar. A chert or flint becomes a finely crystalline quartz rock; sandstones lose their clastic structure and are converted into a mosaic of small close-fitting grains of quartz.

If the rock was originally banded or foliated (as, for example, a laminated sandstone or a foliated calc-schist) this character may not be obliterated, and a banded hornfels is the product; fossils even may have their shapes preserved, though entirely recrystallized, and in many contact altered lavas the steam cavities are still visible, though their contents have usually entered into new combinations to form minerals which were not originally present. The minute structures, however, disappear, often completely, if the thermal alteration is very profound; thus small grains of quartz in a shale are lost or blend with the surrounding particles of clay, and the fine ground-mass of lavas is entirely reconstructed.

By recrystallization in this manner peculiar rocks of very distinct types are often produced. Thus shales may pass into cordierite rocks, or may show large crystals of andalusite (and chiastolite, Plate IV. fig. 9), staurolite, garnet, kyanite and sillimanite. A considerable amount of mica (both muscovite and biotite) is simultaneously formed, and the resulting product has a close resemblance to many kinds of schist. Limestones, if pure, are often turned into coarsely crystalline marbles (Plate IV. fig. 4); but if there was an admixture of clay or sand in the original rock such minerals as garnet, epidote, idocrase, wollastonite, will be present. Sandstones when greatly heated may change into coarse quartzites composed of large clear grains of quartz. These more intense stages of alteration are not so commonly seen in igneous rocks, possibly because their minerals, being formed at high temperatures, are not so easily transformed or recrystallized.

In a few cases rocks are fused and in the dark glassy product minute crystals of spinel, sillimanite and cordierite may separate out. Shales are occasionally thus altered by basalt dikes, and feldspathic sandstones may be completely vitrified. Similar changes may be induced in shales by the burning of coal seams or even by an ordinary furnace.

There is also a tendency for interfusion of the igneous with the sedimentary rock. Granites may absorb fragments of shale or pieces of basalt. In that case hybrid rocks arise which have not the characters of normal igneous or sedimentary rocks. Such effects are scarce and are usually easily recognized. Sometimes an invading granite magma permeates the rocks around, filling their joints and planes of bedding, &c., with threads of quartz and feldspar. This is very exceptional, but instances of it are known and it may take place on a large scale.

Regional Metamorphism. The other type of metamorphism is often said to be regional; sometimes it is called dynamic, but these terms have not strictly the same connotation. It may be said as a rule to make the rock more crystalline and at the same time to give it a foliated, schistose or gneissic structure. This latter consists in a definite arrangement of the minerals, so that such as are platy or prismatic (*e.g.* mica and hornblende, which are very common in these rocks) have their longest axes arranged parallel to one another. For that reason many of these rocks split readily in one direction (schists). The minerals also tend to aggregate in bands; thus there are seams of quartz and of mica in a mica schist, very thin, but consisting essentially of one mineral. These seams are called folia (leaflets), and though never very pure or very persistent they give the rock a streaked or banded character when they are seen edgewise (Plate IV. figs. 6, 7, 8). Along the folia composed of the soft or fissile minerals the rocks will sever most readily, and the freshly split specimen will appear to be faced or coated with this mineral; for example, a piece of mica schist looked at facewise might be supposed to consist entirely of shining scales of mica. On the edge of the specimen, however, the white folia of granular quartz

will be visible. In gneisses these alternating folia are thicker and less regular than in schists; they are often lenticular, dying out rapidly. Gneisses also, as a rule, contain more feldspar than schists do, and they are tougher and less fissile. Contortion or crumpling (Plate IV. fig. 6) of the foliation is by no means uncommon, and then the splitting faces are undulose or puckered. The origin of schistosity or foliation is not perfectly understood, but it is clear that in many cases it is due to pressure, acting in a direction perpendicular to the banding, and to interstitial movement or internal flow arranging the mineral particles while they are crystallizing.

Rocks which were originally sedimentary, and rocks which were undoubtedly igneous, are converted into schists and gneisses, and if originally of similar composition they may be very difficult to distinguish from one another if the metamorphism has been great. A quartz-porphyry, for example, and a fine feldspathic sandstone, may both be converted into a grey or pink mica-schist. Usually, however, we may distinguish between sedimentary and igneous schists and gneisses. Often the metamorphism is progressive, and if the whole district occupied by these rocks be searched traces of bedding, of clastic structure, unconformability or other evidence may be obtained showing that we are dealing with a group of altered sediments. In other cases intrusive junctions, chilled edges, contact alteration or porphyritic structure may prove that in its original condition a metamorphic gneiss was an igneous rock. The last appeal is often to the chemist, for there are certain rock types which occur only as sediments, while others are found only among igneous masses, and, however advanced the metamorphism may be, it rarely modifies the chemical composition of the mass very greatly. Such rocks, for example, as limestones, calc-schists, dolomites, quartzites and aluminous shales have very definite chemical characters which distinguish them even when completely recrystallized.

The schists and gneisses are classified according to the minerals they consist of, and this depends principally on their chemical composition. We have, for example, a group of metamorphic limestones, marbles, calc-schists and cipolins, with crystalline dolomites; many of these contain silicates such as mica, tremolite, diopside, scapolite, quartz and feldspar. They are derived from calcareous sediments of different degrees of purity. Another group is rich in quartz (quartzites, quartz schists and quartzose gneisses), with variable amounts of white and black mica, garnet, feldspar, zoisite and hornblende. These were once sandstones and arenaceous rocks. The graphitic schists may readily be believed to represent sediments once containing coaly matter or plant remains; there are also schistose ironstones (haematite-schists), but metamorphic beds of salt or gypsum are exceedingly uncommon. Among schists of igneous origin we may mention the silky calc-schists, the foliated serpentines (once ultrabasic masses rich in olivine), and the white mica-schists, porphyroids and banded hälleflintas, which have been derived from rhyolites, quartz-porphyries and acid tuffs. The majority of mica-schists, however, are altered clays and shales, and pass into the normal sedimentary rocks through various types of phyllite and mica-slates. They are among the most common metamorphic rocks; some of them are graphitic and others calcareous. The diversity in appearance and composition is very great, but they form a well-defined group not difficult to recognize, from the abundance of black and white micas and their thin, foliated, schistose character. As a special subgroup we have the andalusite-, staurolite-, kyanite- and sillimanite-schists, together with the cordierite-gneisses, which usually make their appearance in the vicinity of gneissose granites, and have presumably been affected by contact alteration. The more coarsely foliated gneisses are almost as frequent as the mica-schists, and present a great variety of types differing in composition and in appearance. They contain quartz, one or more varieties of feldspar, and usually mica hornblende or augite, often garnet, iron oxides, &c. Hence in composition they resemble granite, differing principally in their foliated structure. Many of them have "augen" or large elliptical crystals, mostly feldspar but sometimes quartz, which are the crushed remains of porphyritic minerals; the foliation of the matrix winds around these augen, closing in on each side. Most of these augen gneisses are metamorphic granites, but sometimes a conglomerate bed simulates a gneiss of this kind rather closely. There are other gneisses, which were derived from feldspathic sandstones, grits, arkoses and sediments of that order; they mostly contain biotite and muscovite, but the hornblende and pyroxene gneisses are usually igneous rocks allied in composition to the hornblende-granites and quartz-diorites. The metamorphic forms of dolerite, basalt and the basic igneous rocks generally have a distinctive facies as their pyroxene and olivine are replaced by dark green hornblende, with often epidote, garnet and biotite. These rocks have a well developed foliation, as the prismatic hornblendes lie side by side in parallel arrangement. The majority of amphibolites, hornblende schists, foliated epidiorites and green schists belong to this group. Where they are least altered they pass through chloritic schists into sheared diabases, flaser gabbros and other rocks in which remains of the original igneous minerals and structures occur in greater or less profusion.

BIBLIOGRAPHY.—Most textbooks of geology treat of petrology in more or less detail (see GEOLOGY: § *Bibliography*). Elementary books on petrology include F. H. Hatch, *Petrology* (5th ed., London, 1909); L. V. Pirsson, *Rocks and Rock-minerals* (New York, 1908); J. D. Dana, *Handbook of Mineralogy and Petrography* (12th ed., New York, 1908); A. Harker, *Petrology for Students* (4th ed., Cambridge, 1908); G. A. J. Cole, *Aids to Practical Geology* (6th ed., London, 1909). For rock minerals consult J. P. Iddings, *Rock Minerals* (New York, 1906); A. Johannsen, *Determination of Rock-forming Minerals* (New York, 1908); E. Hussak and E. G. Smith, *Determination of Rock-forming Minerals* (2nd ed., New York, 1893); N. H. and A. N. Winchell, *Optical Mineralogy* (New York, 1909). On the classification and origin of rocks see A. Harker, *Natural History of Igneous Rocks* (London, 1909); J. P. Iddings, *Igneous Rocks*, (New York, 1909); Cross, Iddings, Washington and Pirsson, *Quantitative Classification of Igneous Rocks* (Chicago, 1902); C. Van Hise, *Metamorphism* (Washington, 1904); A. P. Merrill, *Rocks, Rock-weathering and Soils* (London, 1897); C. Doelter, *Petrogenesis* (Brunswick, 1906); J. H. L. Vogt, *Silikatschmelzlösungen* (Christiania, 1903); F. Fouqué and A. Michel Lévy, *Synthèse des minéraux et des roches* (Paris, 1882). The principal authorities on the analysis and chemical composition of rocks are J. Roth, *Beiträge zur Petrographie* (Berlin, 1873–1884); A. Osann, *Beiträge zur chemischen Petrographie* (Stuttgart, 1903); H. S. Washington, *Manual of the Chemical Analysis of Rocks* (New York, 1904) and *Chemical Analyses of Igneous Rocks* (Washington, 1904); F. W. Clarke, *Analyses of Rocks* (Washington, 1904); Max Dittrich, *Anleitung zur Gesteinsanalyse* (Leipzig, 1905); W. F. Hillebrand, *Analysis of Silicate and Carbonate Rocks* (Washington, 1907).

The great systematic treatises on Petrology are F. Zirkel, *Lehrbuch der Petrographie* (2nd ed., Leipzig, 1894, 3 vols.); H. Rosenbusch, *Mikroskopische Physiographie* (4th ed., Stuttgart, 1909, 2 vols.)

Useful German handbooks include: E. Weinschenk, *Polarisationsmikroskop*, *Gesteinsbildende Mineralien* and *Gesteinskunde* (2nd ed., Freiburg, 1907, &c.); R. Reinisch, *Petrographisches Praktikum* (2nd ed., Berlin, 1907); H. Rosenbusch, *Elemente der Gesteinslehre* (3rd ed., Stuttgart, 1909); A. Grubenmann, *Die krystallinen Schiefer* (Berlin, 1907); F. Loewisson Lessing, *Petrographisches Lexikon* (1893 and 1898, also a Fr. ed., 1901); F. Rinne, *Praktische Gesteinskunde* (2nd ed., Hanover, 1905).

The principal French works are E. Jannettaz, *Les Roches* (3rd ed., Paris, 1900); F. Fouqué and A. Michel Lévy, *Minéralogie micrographique* (Paris, 1879); A. Michel Lévy and A. Lacroix, *Les Minéraux des roches* (Paris, 1888); A. Lacroix, *Minéralogie de la France* (I., II., Paris, 1893); and *Les Enclaves des roches éruptives* (Macon, 1893).

British Petrography is the subject of a special work by J. J. H. Teall (London, 1888). Much information about rocks is contained in the memoirs of the various geological surveys, and in *Quart. Journ. of the Geol. Soc. of London*, *Mineralogical Magazine*, *Geological Magazine*, Tschermak's *Mineralogische Mittheilungen* (Vienna), *Neues Jahrbuch für Mineralogie* (Stuttgart), *Journal of Geology* (Chicago), &c. (J. S. F.)

PETRONEL, a 16th or 17th century fire-arm, defined by R. Barret (*Theorike and Practike of Modern Warres*, 1598) as a "horseman's peece." It was the fire-arm which developed on the one hand into the pistol and on the other into the carbine. The name (Fr. *petrinel* for *poitrinal*) was given to the weapon either because it was fired with the butt resting against the chest (*poitrine*, Lat. *pectus*) or because it was carried slung from a belt across the chest.

PETRONIUS (G. (?)[1] Petronius Arbiter), Roman writer of the Neronian age. His own work, the *Satirae*, tells us nothing directly of his fortunes, position, or even century. Some lines of Sidonius Apollinaris refer to him and are often taken to imply that he lived and wrote at Marseilles. If, however, we accept the identification of this author with the Petronius of Tacitus, Nero's courtier, we must suppose either that Marseilles was his birthplace or, as is more likely, that Sidonius refers to the novel itself and that its scene was partly laid at Marseilles. The chief personages of the story are evidently strangers in the towns of southern Italy where we find them. Their Greek-sounding names (Encolpius, Ascyltos, Giton, &c.) and literary training accord with the characteristics of the old Greek colony in the 1st century A.D. The high position among Latin writers ascribed by Sidonius to Petronius, and the mention of him beside Menander by Macrobius, when compared with the absolute silence of Quintilian, Juvenal and Martial, seem adverse to the opinion that the *Satirae* was a work of the age of Nero. But Quintilian was concerned with writers who could be turned to use in the

[1] The MSS. of the *Satirae* give no praenomen. Tacitus's Petronius is Gaius, though the elder Pliny and Plutarch call him Titus. The name Arbiter, given him by later writers, is not an ordinary cognomen; it may have been bestowed on him by contemporaries from the fact that his judgment was regarded as the criterion of good taste.

education of an orator. The silence of Juvenal and Martial may be accidental, or it is possible that a work so abnormal in form and substance was more highly prized by later generations than by the author's contemporaries.

A comparison of the impression the book gives us of the character and genius of its author with the elaborate picture of the courtier in Tacitus certainly suggests the identity of the two. Tacitus, it is true, mentions no important work as the composition of his C. Petronius; such a work as the *Satirae* he may have regarded as beneath that dignity of history which he so proudly realized. The care he gives to Petronius's portrait perhaps shows that the man enjoyed greater notoriety than was due merely to the part he played in history. "He spent his days in sleep, his nights in attending to his official duties or in amusement, by his dissolute life he had become as famous as other men by a life of energy, and he was regarded as no ordinary profligate, but as an accomplished voluptuary. His reckless freedom of speech, being regarded as frankness, procured him popularity. Yet during his provincial governorship, and later when he held the office of consul, he had shown vigour and capacity for affairs. Afterwards returning to his life of vicious indulgence, he became one of the chosen circle of Nero's intimates, and was looked upon as an absolute authority on questions of taste (*arbiter elegantiae*) in connexion with the science of luxurious living." [1] Tacitus goes on to say that this excited the jealousy of Tigellinus, an accusation followed, and Petronius committed suicide in a way that was in keeping with his life and character. He selected the slow process of opening veins and having them bound up again, whilst he conversed on light and trifling topics with his friends. He then dined luxuriously, slept for some time, and, so far from adopting the common practice of flattering Nero or Tigellinus in his will, wrote and sent under seal to Nero a document which professed to give, with the names of his partners, a detailed account of the abominations which that emperor had practised.

A fact confirmatory of the general truth of this graphic portrait is added by the elder Pliny, who mentions that just before his death he destroyed a valuable murrhine vase to prevent its falling into the imperial hands. Do the traits of this picture agree with that impression of himself which the author of the *Satirae* has left upon his work? That we possess therein part of the document sent to Nero is an impossible theory. Our fragments profess to be extracts from the fifteenth and sixteenth books of the *Satirae*: Petronius could not have composed one-tenth even of what we have in the time in which he is said to have composed his memorial to Nero. We may be sure too that the latter was very frank in its language, and treated Nero with far greater severity than the *Banquet* treats Trimalchio. On the other hand, it is clear that the creator of Trimalchio, Encolpius and Giton had the experience, the inclinations and the literary gifts which would enable him to describe with forcible mockery the debaucheries of Nero. And the impression of his personality does in another respect correspond closely with the Petronius of the *Annals*—in the union of immoral sensualism with a rich vein of cynical humour and admirable taste.

The style of the work, where it does not purposely reproduce the solecisms and colloquialisms of the vulgar rich, is of the purest Latin of the Silver age.[2] Nor would there be any point in the verses on the capture of Troy and the Civil War at any other era than that in which Nero's *Troica* and Lucan's *Pharsalia* were fashionable poems. The reciting poet indeed is a feature of a later age also, as we learn from Martial and Juvenal. But we know from Tacitus that the luxury of the table, so conspicuous in Trimalchio's *Banquet*, fell out of fashion after Nero (*Ann.* 3. 55).

Of the work itself there have been preserved 141 sections of a narrative, in the main consecutive, although interrupted by frequent gaps. The name *Satirae*, given in the best MSS., implies that it belongs to the type to which Varro, imitating the Greek Menippus, had given the character of a medley of prose and verse composition. But the string of fictitious narrative by which the medley is held together is something quite new in Roman literature. This careless prodigal was so happily inspired in his devices for amusing himself as to introduce to Rome and thereby transmit to modern times the novel based on the ordinary experience of contemporary life [3]—the precursor of such novels as *Gil Blas* and *Roderick Random*. There is no evidence of the existence of a regular plot in the fragments, but we find one central figure, Encolpius, who professes to narrate his adventures and describe all that he saw and heard, whilst allowing various other personages to exhibit their peculiarities and express their opinions dramatically.

The fragment opens with the appearance of the hero, Encolpius, who seems to be an itinerant lecturer travelling with a companion named Ascyltos and a boy Giton, in a portico of a Greek town, in Campania. An admirable lecture on the false taste in literature, resulting from the prevailing system of education, is replied to by a rival declaimer, Agamemno, who shifts the blame from the teachers to the parents. The central personages of the story next go through a series of questionable adventures, in the course of which they are involved in a charge of robbery. A day or two after they are present at a dinner given by a freedman of enormous wealth, Trimalchio, who entertained with ostentatious and grotesque extravagance a number of men of his own rank but less prosperous. We listen to the ordinary talk of the guests about their neighbours, about the weather, about the hard times, about the public games, about the education of their children. We recognize in an extravagant form the same kind of vulgarity and pretension which the satirist of all times delights to expose in the illiterate and ostentatious millionaires of the age. Next day Encolpius separates from his companions in a fit of jealousy, and, after two or three days' sulking and brooding on his revenge, enters a picture gallery, where he meets with an old poet, who, after talking sensibly on the decay of art and the inferiority of the painters of the age to the old masters, proceeds to illustrate a picture of the capture of Troy by some verses on that theme. This ends in those who are walking in the adjoining colonnade driving him out with stones. The scene is next on board ship, where Encolpius finds he has fallen into the hands of some old enemies. They are shipwrecked, and Encolpius, Giton and the old poet get to shore in the neighbourhood of Crotona, where, as the inhabitants are notorious fortune-hunters, the adventurers set up as men of fortune. The fragment ends with a new set of questionable adventures, in which prominent parts are played by a beautiful enchantress named Circe, a priestess of Priapus, and a certain matron who leaves them her heirs, but attaches a condition to the inheritance which even Encolpius might have shrunk from fulfilling.[4] If we can suppose the author of this work to have been animated by any other motive than the desire to amuse himself, it might be that of convincing himself that the world in general was as bad as he was himself. Juvenal and Swift are justly regarded as among the very greatest of satirists, and their estimate of human nature is perhaps nearly as unfavourable as that of Petronius; but their attitude towards human degradation is not one of complacent amusement; their realism is the realism of disgust, not, like that of Petronius, a realism of sympathy. Martial does not gloat over the vices of which he writes with cynical frankness. He is perfectly aware that they are vices, and that the reproach of them is the worst that can be cast on any one. And, further, Martial, with all his faults, is, in his affections, his tastes, his relations to others, essentially human, friendly, generous, true. There is perhaps not a single sentence in Petronius which implies any knowledge of or sympathy with the existence of affection, conscience or honour, or even the most elementary goodness of heart.

[1] *Ann.* xvi. 18.

[2] The false taste in literature and expression fostered by the *declamationes* is condemned by both Persius and Petronius on the same grounds. Cf. too Pers. i. 121, *hoc ego apertum, hoc ridere meum, tam nil, nulla tibi uendo Iliade* with *Sat.* 52, *meum intellegere nulla pecunia uendo*; Pers. ii. 9, *O si ebulliat patruus, praeclarum funus, et o si sub rastro crepet argenti mihi seria* with *Sat.* 88, *Alius donum promittit, si propinquum divitem extulerit, alius si thesaurum effoderit*, and 42, *homo animam ebulliit*; Pers. iv. 26, *arat . . . quantum non milvus oberrat* with *Sat.* 37, *fundos habet qua milvi volant*. Both use the rare word *baro*. *Animam ebullire* occurs in Seneca's *Apocolocyntosis*, and the verbal resemblances illustrate perhaps rather the common use by both writers of the vulgar style. Cf. for resemblances to the style of the younger Seneca and the date of the work in general, Studer, *Rh. Mus.* (1843).

[3] For the whole question of possible predecessors and Petronius's relation to the extant Greek romances see W. Schmid, "Der griechische Roman" in *Jahrbücher für das klass. Altertum*, &c. (1904). One would certainly have expected the realistic tendency which appears in the New Comedy, the *Characters* of Theophrastus and the Mimes, to have borne this fruit before the first century of our era.—(W. C. Su.)

[4] Omnes qui in testamento meo legata habent praeter libertos meos, hac conditione percipient quae dedi, si corpus meum in partes conciderint et astante populo comederint (141).

The work has reached us in so fragmentary and mutilated a shape that we may of course altogether have missed the key to it; it may have been intended by its author to be a sustained satire, written in a vein of reserved and powerful irony, of the type realized in our modern *Jonathan Wild* or *Barry Lyndon*. Otherwise we must admit that, in the entire divorce of intellectual power and insight from any element of right human feeling, the work is an exceptional phenomenon in literature. For, as a work of original power, of humorous representation, of literary invention and art, the fragment deserves all the admiration which it has received. We recognize the *arbiter elegantiae* in the admirable sense of the remarks scattered through it on education, on art, on poetry and on eloquence. There is a true feeling of nature in the description of a grove of plane-trees, cypresses and pines:

"Has inter ludebat aquis errantibus amnis
Spumeus et querulo vexabat rore lapillos."

And some of the shorter pieces anticipate the terseness and elegance of Martial. The long fragment on the Civil War does not seem to be written so much with the view of parodying as of entering into rivalry with the poem of Lucan. In the epigram extemporized by Trimalchio late on in the banquet:

"Quod non expectes, ex transverso fit—
Et supra nos Fortuna negotia curat,
Quare da nobis vina Falerna, puer,"

we have probably a more deliberate parody of the style of verses produced by the illiterate aspirants to be in the fashion of the day. We might conjecture that the chief gift to which Petronius owed his social and his literary success was that of humorous mimicry. In Trimalchio and his various guests, in the old poet, in the cultivated, depraved and moody Encolpius, in the Chrysis, Quartilla, Polyaenis, &c., we recognize in living examples the play of those various appetites, passions and tendencies which satirists deal with as abstract qualities. Another gift he possesses in a high degree, which must have availed him in society as well as in literature—the gift of story-telling; and some of the stories which first appear in the *Satirae—e.g.* that of the Matron of Ephesus—have enjoyed a great reputation in later times. His style, too, is that of an excellent talker, who could have discussed questions of taste and literature with the most cultivated men of any time as well as amused the most dissolute society of any time in their most reckless revels. One phrase of his is often quoted by many who have never come upon it in its original context, "Horatii curiosa felicitas."

Authorities.—Until about 1650 only part of the Banquet of Trimalchio, with the other fragments of the work, was known. The best MS. of this type is a Leiden MS., a copy by Scaliger of one which seems to have belonged to Cujacius. Marinus Statilius (see, however, Ellis, *Journal of Philology*, 12, p. 266) discovered at Trau in Dalmatia a MS. containing the whole Banquet, which was first published at Padua in 1664.

The important editions are (1) with explanatory notes: Burmann (Amsterdam, 1743, with Heinsius's notes), and, of the *Cena* only, Friedlander (Leipzig, 2nd ed., 1906) and Lowe (Cambridge, 1904); (2) with critical notes: Buecheler (Berlin, 1862, 4th ed., 1904). Translations into German in Friedländer's edition (*Cena* only), into French by de Guerle (complete, in Garnier's *Bibliothèque*), into English in Lowe's edition (*Cena* only) and Bohn's series (complete). Lexicon to Petronius by Segebade and Lommatsch (Leipzig, 1898). Criticism, &c., in Haley, "Quaestt. Petron." (*Harvard Studies*, 1891); Collignon, *Étude sur Pétrone* (Paris, 1892); Emile Thomas, *L'Envers de la société romaine d'après Pétrone* (Paris, 1892); Hirzel, *Der Dialog.* ii. (Leipzig, 1895); Tyrrell, *Latin Poetry* (London, 1895); Norden, *Antike Kunstprosa* i. (Leipzig, 1898); Henderson, *Life and Principate of the Emperor Nero* (London, 1903); Dill, *Roman Society from Nero to Marcus Aurelius* (London, 1905); and the various histories of Roman literature (especially Schanz, §§ 395 sqq.).
(W. Y. S.; W. C. Su.)

PETROPAVLOVSK, a town of West Siberia, in the government of Akmolinsk, on the right bank of the Ishim River, and on the great Siberian highway, 170 m. by rail W. of Omsk. The population, 7850 in 1865, was 21,796 in 1900, of whom one-third were Mahommedan Kirghiz. The town carries on an active trade in cattle, furs, tea, wool, skins, cottons, woollen stuffs, corn, metals, metallic wares and spirits. The small fort of Petropavlovsk was founded in 1752, and was the military centre of the Ishim line of fortifications.

Petropavlovsk is also the name of a Russian seaport in Kamchatka, on the eastern shore of the Bay of Avacha, in 53° N. and 158° 44′ E. Its harbour, one of the best on the Pacific, is little used, and the town consists merely of a few huts with some 400 inhabitants. Its naval institutions were transferred to Nikolayevsk after the attack of the Anglo-French fleet in 1854.

PETROPOLIS, a city of the state of Rio de Janeiro, Brazil, in an elevated valley of the Serra da Estrella, 2634 ft. above sea-level and 27 m. N. of the city of Rio de Janeiro, with which it is connected by a combined railway and steamship line, and also by a longer railway line. Pop. of the municipality (1900), 29,331, a large percentage being summer residents, as the census was taken late in December; (1902, municipal census), 18,373. Petropolis is served by the Principe do Grão Pará railway, now a part of the Leopoldina system, which connects with Rio de Janeiro and Nictheroy on the coast, and with the station of Entre Rios on the Central of Brazil railway. Its altitude gives the city a cool invigorating climate, making it a favourite summer residence for the well-to-do classes of Rio. The rainfall is abundant, and especially so in summer (December to March), when the humidity is extreme. Vegetation is luxuriant and comprises a great variety of tropical and sub-tropical species. The city is built in a large, irregularly shaped basin formed by streams which converge to form the Piabanha River, a tributary of the Parahyha do Sul. Among the public buildings are the old imperial palace, a modern summer residence of the national executive and a municipal hall. Although Petropolis is not a commercial centre, its water-power and cool climate are making it an important manufacturing town. Among the products are cotton fabrics and garments, beer, and Camembert and Brie cheeses.

Petropolis was founded in 1845 by Julius Frederick Köler under the auspices of the emperor of Brazil, Dom Pedro II., on lands purchased by his father, Dom Pedro I., in 1822. The place was previously known as Corrego Secco, which Dr George Gardner described in 1837 as "a small, miserable village." The first emperor planned to establish there a German colony, but the plan was not realized until 1845, when about 2700 colonists from Germany were located there. Its growth was slow, but the choice of the place by the emperor as a summer residence drew thither many of the wealthy residents of the capital. The Mauá railway was opened to the foot of the *serra* (Raiz da Serra) in 1854, and the macadamized road up the *serra* to the town in 1856. The mountain section of the railway, on the Riggenbach system, was completed in 1883. Petropolis has since become the summer residence of the diplomatic corps and of the higher officials of the Federal government, and was the capital of the state of Rio de Janeiro from 1893 to 1903.

PETROVSK, a seaport of Russia in Transcaucasia, on the Caspian Sea, in the province of Daghestan, 180 m. by rail E. of Vladikavkaz, and 235 m. N.W. from Baku. Pop. 9806. The town has become the port of embarcation for Krasnovodsk, the Transcaspian territory, and the Central Asian khanates. There are naphtha wells; and the hot sulphur baths at Ak-gol and Talga, close by, attract many visitors in summer.

PETROVSK, a town of eastern Russia, in the government of Saratov, on the Medvyeditsa, a tributary of the Don, 60 m. N.W. of the town of Saratov. Pop. (1864), 10,128; (1897), 13,212. It was founded by Peter the Great in 1698 as a defence against the Kuban Tatars. Its industrial establishments include distilleries, tanneries, tallow and brickworks.

PETROZAVODSK, a town and episcopal see of Russia, capital of the government of Olonets, on the west shore of Lake Onega, 190 m. N.E. of St Petersburg. Pop. (1865), 11,027; (1897), 12,521. Two cathedrals, built towards the end of the 18th century, a mining school, an ecclesiastical seminary and a government cannon-foundry are the chief public buildings and institutions. Peter the Great founded ironworks here in 1703, but they continued in operation only twenty-four years. The cannon-foundry was instituted in 1774. Petrozavodsk became the capital of the government of Olonets in 1802.

PETRUCCI, PANDOLFO (d. 1512), tyrant of Siena, spent the greater part of his youth in exile, on account of the civil strife by which his native town of Siena was torn; but on the triumph of the party of the *Noveschi* (those who supported the Council of Nine) in 1487 he was able to return home. On the death of his brother Giacopo, one of the most powerful men in the city, Pandolfo succeeded to all the latter's offices and emoluments (1497), thus becoming in fact if not in name master of Siena. By his marriage with Aurelia, daughter of Nicola Borghese, another very influential citizen, he still further strengthened his authority. But he soon began to abuse his power by selling public offices to

the highest bidders, or conferring them on his followers. A plot was made to murder him, but he discovered the conspiracy in time, and his own father-in-law, who had been leader of the movement, was put to death. In 1498 he prevented the outbreak of war with Florence over the possession of Montepulciano, which had been a bone of contention between the two cities for over a hundred years. His attitude towards Cesare Borgia was exceedingly astute; at first he assisted him, and obtained from him with the favour of the French king the cession of Piombino; but having subsequently aroused the suspicions of Borgia, the latter attempted to suppress Petrucci by inviting him to the fatal meeting of Senigallia. The Sienese tyrant, however, did not fall into the trap, and although Borgia in 1502 obliged him to quit Siena, he returned two months later, more powerful than before. Petrucci supported Pisa in the war against Florence, but eventually, through the intervention of the pope and of the king of Spain, he made peace with the latter city, to which he gave back Montepulciano in 1512. As a reward for this action Pope Julius II. created his nephew cardinal. During his last days Petrucci abdicated his authority in favour of his son Borghese. He died at San Quirico di Osenna on the 21st of May 1512.

See Pecci, *Memorie storico-critiche di Siena* (Siena, 1755); U. G. Mondolfo, *P. Petrucci signore di Siena* (Siena, 1899).

PETRUS AUREOLUS (ORIOL), scholastic philosopher and monk of the Franciscan order, lived in the latter half of the 13th century, and died in Paris in 1321 just after his appointment as archbishop of Aix. He was one of the first to attack the realist doctrines of Duns Scotus, and is interesting mainly as the precursor of William of Occam in his revival of Nominalism. His ability earned for him the titles of *Doctor Facundus* and *Doctor Abundans.*

PETTENKOFEN, AUGUST VON (1821–1889), Austrian painter, born in Vienna, was brought up on his father's estate in Galicia. Having decided to give up the military career on which he had started, he devoted himself to painting, taking for his subjects the simple scenes of the life on the dreary Puszta. His paintings are treasured for their fine qualities of colour, and for the sincerity with which the artist sets before us the uneventful melancholy life of Hungarian peasants and gipsies—without any theatrical pathos or forced humour. He was the inventor of the Pettenkofen box, an appliance for dissolving and redistributing cracked or discoloured varnish without friction or the dangerous use of chemicals. He died in Vienna in 1889.

PETTENKOFER, MAX JOSEPH VON (1818–1901), Bavarian chemist and hygienist, was born on the 3rd of December 1818 at Lichtenheim, near Neuburg. He was a nephew of Franz Xaver Pettenkofer (1783–1850), who from 1823 was surgeon and apothecary to the Bavarian court and was the author of some chemical investigations on the vegetable alkaloids. He studied pharmacy and medicine at Munich, where he graduated M.D. in 1843, and after working under Liebig at Giessen was appointed chemist to the Munich mint in 1845. Two years later he was chosen extraordinary professor of chemistry in the medical faculty, in 1853 he received the ordinary professorship, and in 1865 he became also professor of hygiene. In 1894 he retired from active work, and on the 10th of February 1901 he shot himself in a fit of depression at his home on the Starnberger See, near Munich. In his earlier years he devoted himself to chemistry, both theoretical and applied, publishing papers on the preparation of gold and platinum, numerical relations between the atomic weights of analogous elements, the formation of aventurine glass, the manufacture of illuminating gas from wood, the preservation of oil-paintings, &c. The reaction known by his name for the detection of bile acids was published in 1844. In his widely used method for the quantitative determination of carbonic acid the gaseous mixture is shaken up with baryta or lime water of known strength and the change in alkalinity ascertained by means of oxalic acid. But his name is most familiar in connexion with his work in practical hygiene, as an apostle of good water, fresh air and proper sewage disposal. His attention was drawn to this subject about 1850 by the unhealthy condition of Munich.

Pettenkofer gave vigorous expression to his views on hygiene and disease in numerous books and papers; he was an editor of the *Zeitschrift für Biologie* from 1865 to 1882, and of the *Archiv für Hygiene* from 1883 to 1894.

PETTICOAT, an underskirt, as part of a woman's dress. The petticoat, *i.e.* "petty-coat" or small coat, was originally a short garment for the upper part of the body worn under an outer dress; in the *Promptorium parvulorum* the Latin equivalent is *tunicula*. It was both a man's and a woman's garment, and was in the first case worn as a small coat under the doublet, and by women apparently as a kind of chemise. It was, however, early applied to the skirt worn by women hanging from the waist, whether as the principal lower garment or as an underskirt. In the middle of the 17th century the wide breeches with heavy lace or embroidered ends worn by men were known as "petticoat breeches," a term also applied to the loose canvas or oilskin overalls worn by fishermen.

PETTIE, JOHN (1839–1893), Scottish painter, was born in Edinburgh on the 17th of March 1839, the son of Alexander and Alison Pettie. In 1852 the family removed to East Linton, Haddingtonshire, and a portrait by the lad of the village carrier and his donkey overcame his father's objections to art as a career for his son. When sixteen he entered the Trustees' Academy in Edinburgh, working under Robert Scott Lauder with W. Q. Orchardson, J. MacWhirter, W. M'Taggart, Peter Graham, Tom Graham and G. P. Chalmers. His first exhibits at the Royal Scottish Academy were "A Scene from the Fortunes of Nigel"—one of the many subjects for which he sought inspiration in the novels of Sir Walter Scott—and two portraits in 1858, followed in 1859 by "The Prison Pet." To the Royal Academy in 1860 he sent "The Armourers"; and the success of this work and of "What d'ye Lack, Madam?" in the following year, encouraged him to settle in London (1862), where he joined Orchardson. In 1866 he was elected an Associate of the Royal Academy, and in 1874 received full academical honours in succession to Sir Edwin Landseer. His diploma picture was "Jacobites, 1745." Pettie was a hard and rapid worker, and, in his best days, a colourist of a high order and a brilliant executant. In his early days he produced a certain amount of book illustration. His connexion with *Good Words* began in 1861, and was continued till 1864. With J. MacWhirter he illustrated *The Postman's Bag* (Strahan, 1862), and Wordsworth's *Poetry for the Young* (Strahan, 1863). His principal paintings, in addition to those already mentioned, are "Cromwell's Saints" (1862); "The Trio" (1863); "George Fox refusing to take the Oath" (1864); "A Drumhead Court-martial" (1865); "The Arrest for Witchcraft" (1866); "Treason" (1867, now in the Mappin Art Gallery, Sheffield); "Tussle with a Highland Smuggler" (1868); "The Sally" (1870); "Terms to the Besieged" (1872); "The Flag of Truce" (1873); "Ho! Ho! Old Noll" and "A State Secret" (1874); "A Sword and Dagger Fight" (1877); "The Death Warrant" (1879); "Monmouth and James II." (1882); "The Vigil" (1884, in the Chantrey Collection, National Gallery of British Art); "Challenged" (1885); "The Chieftain's Candlesticks" (1886); "Two Strings to Her Bow" (1887); "The Traitor" and "Sir Charles Wyndham as David Garrick" (1888); and "The Ultimatum" and "Bonnie Prince Charlie" (1892). Pettie died at Hastings on the 21st of February 1893. In 1894 a selection of his work was included in the Winter Exhibition of the Royal Academy. His portrait by himself is in the Tate Gallery.

John Pettie, R.A. (London, 1908), by his nephew Martin Hardie, gives the story of his life, a catalogue of his pictures, and fifty reproductions in colours.

PETTY, SIR WILLIAM (1623–1687), English statistician and political economist, born on the 26th of May 1623, was the son of a clothier at Romsey in Hampshire, and received his early education at the grammar school there. About the age of fifteen he went to Caen (Normandy), taking with him a little stock of merchandise, on which he traded, and so maintained himself whilst learning French, improving himself in Latin and Greek, and studying mathematics and other sciences. On his return to England he seems to have had for a short time a place

The work has reached us in so fragmentary and mutilated a shape that we may of course altogether have missed the key to it; it may have been intended by its author to be a sustained satire, written in a vein of reserved and powerful irony, of the type realized in our modern *Jonathan Wild* or *Barry Lyndon*. Otherwise we must admit that, in the entire divorce of intellectual power and insight from any element of right human feeling, the work is an exceptional phenomenon in literature. For, as a work of original power, of humorous representation, of literary invention and art, the fragment deserves all the admiration which it has received. We recognize the *arbiter elegantiae* in the admirable sense of the remarks scattered through it on education, on art, on poetry and on eloquence. There is a true feeling of nature in the description of a grove of plane-trees, cypresses and pines:

> "Has inter ludebat aquis errantibus amnis
> Spumeus et querulo vexabat rore lapillos."

And some of the shorter pieces anticipate the terseness and elegance of Martial. The long fragment on the Civil War does not seem to be written so much with the view of parodying as of entering into rivalry with the poem of Lucan. In the epigram extemporized by Trimalchio late on in the banquet:

> "Quod non expectes, ex transverso fit—
> Et supra nos Fortuna negotia curat,
> Quare da nobis vina Falerna, puer,"

we have probably a more deliberate parody of the style of verses produced by the illiterate aspirants to be in the fashion of the day. We might conjecture that the chief gift to which Petronius owed his social and his literary success was that of humorous mimicry. In Trimalchio and his various guests, in the old poet, in the cultivated, depraved and moody Encolpius, in the Chrysis, Quartilla, Polyaenis, &c., we recognize in living examples the play of those various appetites, passions and tendencies which satirists deal with as abstract qualities. Another gift he possesses in a high degree, which must have availed him in society as well as in literature—the gift of story-telling; and some of the stories which first appear in the *Satirae*—*e.g.* that of the Matron of Ephesus—have enjoyed a great reputation in later times. His style, too, is that of an excellent talker, who could have discussed questions of taste and literature with the most cultivated men of any time as well as amused the most dissolute society of any time in their most reckless revels. One phrase of his is often quoted by many who have never come upon it in its original context, "Horatii curiosa felicitas."

AUTHORITIES.—Until about 1650 only part of the Banquet of Trimalchio, with the other fragments of the work, was known. The best MS. of this type is a Leiden MS., a copy by Scaliger of one which seems to have belonged to Cujacius. Marinus Statilius (see, however, Ellis, *Journal of Philology*, 12, p. 266) discovered at Trau in Dalmatia a MS. containing the whole Banquet, which was first published at Padua in 1664.

The important editions are (1) with explanatory notes: Burmann (Amsterdam, 1743, with Heinsius's notes), and, of the *Cena* only, Friedlander (Leipzig, 2nd ed., 1906) and Lowe (Cambridge, 1904); (2) with critical notes: Buecheler (Berlin, 1862, 4th ed., 1904). Translations into German in Friedländer's edition (*Cena* only), into French by de Guerle (complete, in Garnier's *Bibliothèque*), into English in Lowe's edition (*Cena* only) and Bohn's series (complete). (Leipzig, 1898); Henderson, *Life and Principate of the Emperor Nero* (London, 1903); Dill, *Roman Society from Nero to Marcus Aurelius* (London, 1905); and the various histories of Roman literature (especially Schanz, §§ 395 sqq.).

(W. Y. S.; W. C. Su.)

PETROPAVLOVSK, a town of West Siberia, in the government of Akmolinsk, on the right bank of the Ishim River, and on the great Siberian highway, 170 m. by rail W. of Omsk. The population, 7850 in 1865, was 21,796 in 1900, of whom one-third were Mahommedan Kirghiz. The town carries on an active trade in cattle, furs, tea, wool, skins, cottons, woollen stuffs, corn, metals, metallic wares and spirits. The small fort of Petropavlovsk was founded in 1752, and was the military centre of the Ishim line of fortifications.

PETROPAVLOVSK is also the name of a Russian seaport in Kamchatka, on the eastern shore of the Bay of Avacha, in 53° N. and 158° 44′ E. Its harbour, one of the best on the Pacific, is little used, and the town consists merely of a few huts with some 400 inhabitants. Its naval institutions were transferred to Nikolayevsk after the attack of the Anglo-French fleet in 1854.

PETROPOLIS, a city of the state of Rio de Janeiro, Brazil, in an elevated valley of the Serra da Estrella, 2634 ft. above sea-level and 27 m. N. of the city of Rio de Janeiro, with which it is connected by a combined railway and steamship line, and also by a longer railway line. Pop. of the municipality (1900), 29,331, a large percentage being summer residents, as the census was taken late in December; (1902, municipal census), 18,373. Petropolis is served by the Principe do Grão Pará railway, now a part of the Leopoldina system, which connects with Rio de Janeiro and Nictheroy on the coast, and with the station of Entre Rios on the Central of Brazil railway. Its altitude gives the city a cool invigorating climate, making it a favourite summer residence for the well-to-do classes of Rio. The rainfall is abundant, and especially so in summer (December to March), when the humidity is extreme. Vegetation is luxuriant and comprises a great variety of tropical and sub-tropical species. The city is built in a large, irregularly shaped basin formed by streams which converge to form the Piabanha River, a tributary of the Parahyha do Sul. Among the public buildings are the old imperial palace, a modern summer residence of the national executive and a municipal hall. Although Petropolis is not a commercial centre, its water-power and cool climate are making it an important manufacturing town. Among the products are cotton fabrics and garments, beer, and Camembert and Brie cheeses.

Petropolis was founded in 1845 by Julius Frederick Köler under the auspices of the emperor of Brazil, Dom Pedro II., on lands purchased by his father, Dom Pedro I., in 1822. The place was previously known as Corrego Secco, which Dr George Gardner described in 1837 as "a small, miserable village." The first emperor planned to establish there a German colony, but the plan was not realized until 1845, when about 2700 colonists from Germany were located there. Its growth was slow, but the choice of the place by the emperor as a summer residence drew thither many of the wealthy residents of the capital. The Mauá railway was opened to the foot of the *serra* (Raiz da Serra) in 1854, and the macadamized road up the *serra* to the town in 1856. The mountain section of the railway, on the Riggenbach system, was completed in 1883. Petropolis has since become the summer residence of the diplomatic corps and of the higher officials of the Federal government, and was the capital of the state of Rio de Janeiro from 1893 to 1903.

PETROVSK, a seaport of Russia in Transcaucasia, on the Caspian Sea, in the province of Daghestan, 180 m. by rail E. of Vladikavkaz, and 235 m. N.W. from Baku. Pop. 9806. The town has become the port of embarcation for Krasnovodsk, the Transcaspian territory, and the Central Asian khanates. There are naphtha wells; and the hot sulphur baths at Ak-gol and Talga, close by, attract many visitors in summer.

PETROVSK, a town of eastern Russia, in the government of Saratov, on the Medvyeditsa, a tributary of the Don, 60 m. N.W. of the town of Saratov. Pop. (1864), 10,128; (1897), 13,212. It was founded by Peter the Great in 1698 as a defence against the Kuban Tatars. Its industrial establishments include distilleries, tanneries, tallow and brickworks.

PETROZAVODSK, a town and episcopal see of Russia, capital of the government of Olonets, on the west shore of Lake Onega, 190 m. N.E. of St Petersburg. Pop. (1865), 11,027; (1897), 12,521. Two cathedrals, built towards the end of the 18th century, a mining school, an ecclesiastical seminary and a government cannon-foundry are the chief public buildings and institutions. Peter the Great founded ironworks here in 1703, but they continued in operation only twenty-four years. The cannon-foundry was instituted in 1774. Petrozavodsk became the capital of the government of Olonets in 1802.

PETRUCCI, PANDOLFO (d. 1512), tyrant of Siena, spent the greater part of his youth in exile, on account of the civil strife by which his native town of Siena was torn; but on the triumph of the party of the *Noveschi* (those who supported the Council of Nine) in 1487 he was able to return home. On the death of his brother Giacopo, one of the most powerful men in the city, Pandolfo succeeded to all the latter's offices and emoluments (1497), thus becoming in fact if not in name master of Siena. By his marriage with Aurelia, daughter of Nicola Borghese, another very influential citizen, he still further strengthened his authority. But he soon began to abuse his power by selling public offices to

her steward, Reginald de Wyndsor, and was afterwards given to her brother Josceline, who held it of the honour of Arundel. Josceline married Agnes de Percy and assumed the surname of Percy. The honour and manor of Petworth followed the descent of this family until 1708. In 1377 Henry Percy was created earl of Northumberland. The only daughter of the last earl married Charles, duke of Somerset, in 1682, and Petworth descended through their daughter Catherine to the earls of Egremont. The adopted son of the third earl was created Baron Leconfield in 1859.

PEUTINGER, KONRAD (1465–1547), German humanist and antiquarian, was born at Augsburg. In 1497 he was town clerk of his native place, and was on intimate terms with the emperor Maximilian. He was one of the first to publish Roman inscriptions, and his name remains associated with the famous *Tabula peutingeriana* (see MAP), a map of the military roads of the western Roman Empire, which was discovered by Konrad Celtes, who handed it over to Peutinger for publication. Peutinger also edited the *Historia Gothorum* of Jordanes, and the *Historia gentis Langobardorum* of Paulus Diaconus.

The *Tabula peutingeriana* was first published as a whole by F. de Scheyb (1753); later editions by E. Desjardins (1869–1874) and C. Miller (1888); see also E. Paulus, *Erklärung der Peutinger Tafel* (1867); and Teuffel-Schwabe, *Hist. of Roman Literature* (Eng. trans., 1900).

PEVENSEY, a village in the Eastbourne parliamentary division of Sussex, England, 65 m. S.S.E. from London by the London, Brighton & South Coast railway. Pop. (1901), 468. The village is a member of the Cinque Ports, but the sea has receded a mile from it in historic times. The outer wall, with solid towers, of the celebrated castle, is of Roman construction, and originally enclosed a complete oval; it is generally considered to have enclosed the strong town of *Anderida*. Within rise the fine ruins, principally of the 13th century, but in part Norman, of the castle proper, with a keep and four massive round towers. The church of St Nicholas, close to the castle, shows beautiful Early English work. It has been supposed that Pevensey was the scene of the landing of Caesar in 55 B.C., but the question is disputed.

The name of Pevensey (Paevenisel, Pevensel, Pevenes, Pemsey) first occurs in a grant of land there by the south Saxon Duke Berthuald to the abbey of St Denis in 795. In later Saxon times, at least by the reign of Edward the Confessor, it was a royal borough and had a harbour and a market. Its early importance was due to its fencible port. It was the landing place of William the Norman on his way to conquer, and was the *caput* of the rape of Pevensey, which was granted by William to the earl of Mortain and subsequently became the Honour of the Eagle. Some time before the reign of Edward I. the town of Pevensey was made a member of Hastings and shared the liberties of the Cinque Ports, but apart from them it possesses no charter. It was governed by a bailiff and twelve jurats, elected annually, until by an act of 1883 it ceased to exist as a borough. Its seal dates apparently from the reign of Henry III. The gradual decline of Pevensey was complete in the 15th century and was caused by the recession of the sea and consequent loss of the harbour.

PEW (Mid. Eng. *puwe*, through O. Fr. *puya*, *pui*, mod. *puy*, in the sense of hill, cf. *appuyer*, to lean against; from Lat. *podium*, a high place, balcony; Gr. πόδιον, pedestal, πούς, foot), a term, in its most usual meaning, for a fixed seat in a church, usually enclosed, slightly raised from the floors, and composed of wood framing, mostly with ornamented ends. Some bench ends are certainly of Decorated character, and some have been considered to be of the Early English period. They are sometimes of plain oak board, 2½ to 3 in. thick, chamfered, and with a necking and finial generally called a *poppy head*; others are plainly panelled with bold cappings; in others the panels are ornamented with tracery or with the *linen pattern*, and sometimes with running foliages. The large pews with high enclosures, curtains, &c., known familiarly as "horse-boxes," and common in English parish churches during the 18th and early part of the 19th centuries, have nearly all been cleared away. The parish church of Whitby, in Yorkshire, is perhaps the best surviving example of an unaltered interior.

The Latin word *podium* was particularly applied to a balcony or parapet next to the arena in the Roman theatre where the emperor and other distinguished persons sat. According to Du Cange (*Glossarium*, *s.v. podium*), it is found in medieval Latin for a bench (*subsellium*) for the minor canons at a church in Lyons (1343), and also for a kneeling stool in a monastic church. The word "pew" in English was often used for a stall for the minister, for a reading desk, or for a pulpit. The floor space of the nave and transepts of medieval churches was usually open, mats being sometimes provided for kneeling, and if any fixed seats were provided these would be for the patrons of the church or for distinguished people. Some enclosed seats, however, seem to have been reserved for women, as is seen in *Piers Plowman*, ch. vii. 144, "Among wyves and wodewes ich am ywoned sitte yparroked in puwes." They did not come into general use till the middle of the 15th or beginning of the 16th century (see Gasquet, *Parish Life in Medieval England*, (1906, pp. 62 and 133). Over the few seats thus allotted dispute arose and attempts were made to appropriate them. Thus the constitutions for the synod of Exeter, drawn up by Bishop Peter Quivel in 1287, forbid any one "to claim any sitting in the church as his own. . . . Whoever first comes to pray, let him take what place he wishes in which to pray."

At common law all seats in a parish church are for the common use of all the parishioners, and every parishioner has a right to a seat without paying for it. The disposition of the seats is in the discretion of the churchwardens acting for the ordinary for the purpose of orderly arrangement (as to the exercise of this discretion see *Reynolds* v. *Monckton*, 1841, 2 M. & R. 384), and this can be exercised in cases where all the seats are free (*Asher* v. *Calcraft*, 1887, 18 Q.B.D. 607). The right to a seat does not belong to a non-parishioner. As against the assignment and disposition of seats by the ordinary, acting through the churchwardens, two kinds of appropriation can be set up (*a*) by the grant of a faculty by the ordinary, and (*b*) by prescription, based on the presumption of a lost faculty. Such faculties are rarely granted now; they were formerly common; the grant was to a man and his family "so long as they remain inhabitants of a certain house in the parish"; the words "of a certain house" are now usually omitted. The claim to a pew by prescription must be in respect of a house in the parish; the right is subject to the burden of repairing the pew; it is not an easement, nor does the Prescription Act 1832 apply to it (see for the whole subject of a claim by prescription *Phillips* v. *Halliday*, 1891, A.C. 228). The letting of pews in parish churches became common in the 16th century, but there are some earlier instances of the use, for example at St Ewens, Bristol, in 1455 (*Churchwardens' Accounts*, Sir J. Maclean, *Trans. Bristol and Gloucester Archaeol. Assoc.*, vol. xv., 1890–1891). The taking of pew rents in parish churches is illegal (Lord Stowell, in *Walter* v. *Gunner*, 1798, 3 *Hag. Consist.* 817); but under the various Church Building Acts seats may be let and rents charged to pay the salary of the minister, &c.

See A. Heales, *History and Law of Church Seats and Pews* (1872); Phillimore, *Eccles. Law* (1896), ii. 1424 seq.

PEWTER, a general name used to denote a number of alloys of various metals in diverse proportions, the sole common feature of which lies in the fact that tin is always the chief constituent. The etymology of the word is doubtful, but it is probably an English modification of *spelter*, which was adopted with more or less local alteration by the continental European nations, who at an early period were eager purchasers of the ware, becoming *peauter* in Dutch, *peutre*, *peautre* or *piautre* in French, *peltro* in Italian and *peltre* in Spanish. Roman pewter, the oldest known, which has been disinterred at various places in England and elsewhere, was composed of tin and lead alone, for the occasional traces of iron are believed to be accidental, in proportions which, though varying considerably, group themselves around two definite formulae, one containing 71·5 parts of tin to 27·8 of lead, the other 78·2 of tin to 21·7 of lead, or one libra of tin to 4½ and 3 unciae of lead respectively. On the European continent in the middle ages, some ten centuries later than the supposed date of the Roman pewter found in Britain, when we first get definite records of the composition of pewter, lead remained the chief, if not the only secondary ingredient. In 1437 the pewterers of Montpelier added 4 parts of lead to 96 of tin,

The work has reached us in so fragmentary and mutilated a shape that we may of course altogether have missed the key to it; it may have been intended by its author to be a sustained satire, written in a vein of reserved and powerful irony, of the type realized in our modern *Jonathan Wild* or *Barry Lyndon*. Otherwise we must admit that, in the entire divorce of intellectual power and insight from any element of right human feeling, the work is an exceptional phenomenon in literature. For, as a work of original power, of humorous representation, of literary invention and art, the fragment deserves all the admiration which it has received. We recognize the *arbiter elegantiae* in the admirable sense of the remarks scattered through it on education, on art, on poetry and on eloquence. There is a true feeling of nature in the description of a grove of plane-trees, cypresses and pines:

> "Has inter ludebat aquis errantibus amnis
> Spumeus et querulo vexabat rore lapillos."

And some of the shorter pieces anticipate the terseness and elegance of Martial. The long fragment on the Civil War does not seem to be written so much with the view of parodying as of entering into rivalry with the poem of Lucan. In the epigram extemporized by Trimalchio late on in the banquet:

> "Quod non expectes, ex transverso fit—
> Et supra nos Fortuna negotia curat,
> Quare da nobis vina Falerna, puer,"

we have probably a more deliberate parody of the style of verses produced by the illiterate aspirants to be in the fashion of the day. We might conjecture that the chief gift to which Petronius owed his social and his literary success was that of humorous mimicry. In Trimalchio and his various guests, in the old poet, in the cultivated, depraved and moody Encolpius, in the Chrysis, Quartilla, Polyaenis, &c., we recognize in living examples the play of those various appetites, passions and tendencies which satirists deal with as abstract qualities. Another gift he possesses in a high degree, which must have availed him in society as well as in literature—the gift of story-telling; and some of the stories which first appear in the *Satirae—e.g.* that of the Matron of Ephesus—have enjoyed a great reputation in later times. His style, too, is that of an excellent talker, who could have discussed questions of taste and literature with the most cultivated men of any time as well as amused the most dissolute society of any time in their most reckless revels. One phrase of his is often quoted by many who have never come upon it in its original context, "Horatii curiosa felicitas."

AUTHORITIES.—Until about 1650 only part of the Banquet of Trimalchio, with the other fragments of the work, was known. The best MS. of this type is a Leiden MS., a copy by Scaliger of one which seems to have belonged to Cujacius. Marinus Statilius (see, however, Ellis, *Journal of Philology*, 12, p. 266) discovered at Trau in Dalmatia a MS. containing the whole Banquet, which was first published at Padua in 1664.

The important editions are (1) with explanatory notes: Burmann (Amsterdam, 1743, with Heinsius's notes), and, of the *Cena* only, Friedlander (Leipzig, 2nd ed., 1906) and Lowe (Cambridge, 1904); (2) with critical notes: Buecheler (Berlin, 1862, 4th ed., 1904). Translations into German in Friedländer's edition (*Cena* only), into French by de Guerle (complete, in Garnier's *Bibliothèque*), into English in Lowe's edition (*Cena* only) and Bohn's series (complete). Lexicon to Petronius by Segebade and Lommatsch (Leipzig, 1898). Criticism, &c., in Haley, "Quaestt. Petron." (*Harvard Studies*, 1891); Collignon, *Étude sur Pétrone* (Paris, 1892); Emile Thomas, *L'Envers de la société romaine d'après Pétrone* (Paris, 1892); Hirzel, *Der Dialog*. ii. (Leipzig, 1895); Tyrrell, *Latin Poetry* (London, 1895); Norden, *Antike Kunstprosa* i. (Leipzig, 1898); Henderson, *Life and Principate of the Emperor Nero* (London, 1903); Dill, *Roman Society from Nero to Marcus Aurelius* (London, 1905); and the various histories of Roman literature (especially Schanz, §§ 395 sqq.).

(W. Y. S.; W. C. Su.)

PETROPAVLOVSK, a town of West Siberia, in the government of Akmolinsk, on the right bank of the Ishim River, and on the great Siberian highway, 170 m. by rail W. of Omsk. The population, 7850 in 1865, was 21,796 in 1900, of whom one-third were Mahommedan Kirghiz. The town carries on an active trade in cattle, furs, tea, wool, skins, cottons, woollen stuffs, corn, metals, metallic wares and spirits. The small fort of Petropavlovsk was founded in 1752, and was the military centre of the Ishim line of fortifications.

PETROPAVLOVSK is also the name of a Russian seaport in Kamchatka, on the eastern shore of the Bay of Avacha, in 53° N. and 158° 44′ E. Its harbour, one of the best on the Pacific, is little used, and the town consists merely of a few huts with some 400 inhabitants. Its naval institutions were transferred to Nikolayevsk after the attack of the Anglo-French fleet in 1854.

PETROPOLIS, a city of the state of Rio de Janeiro, Brazil, in an elevated valley of the Serra da Estrella, 2634 ft. above sea-level and 27 m. N. of the city of Rio de Janeiro, with which it is connected by a combined railway and steamship line, and also by a longer railway line. Pop. of the municipality (1900), 29,331, a large percentage being summer residents, as the census was taken late in December; (1902, municipal census), 18,373. Petropolis is served by the Principe do Grão Pará railway, now a part of the Leopoldina system, which connects with Rio de Janeiro and Nictheroy on the coast, and with the station of Entre Rios on the Central of Brazil railway. Its altitude gives the city a cool invigorating climate, making it a favourite summer residence for the well-to-do classes of Rio. The rainfall is abundant, and especially so in summer (December to March), when the humidity is extreme. Vegetation is luxuriant and comprises a great variety of tropical and sub-tropical species. The city is built in a large, irregularly shaped basin formed by streams which converge to form the Piabanha River, a tributary of the Parahyha do Sul. Among the public buildings are the old imperial palace, a modern summer residence of the national executive and a municipal hall. Although Petropolis is not a commercial centre, its water-power and cool climate are making it an important manufacturing town. Among the products are cotton fabrics and garments, beer, and Camembert and Brie cheeses.

Petropolis was founded in 1845 by Julius Frederick Köler under the auspices of the emperor of Brazil, Dom Pedro II., on lands purchased by his father, Dom Pedro I., in 1822. The place was previously known as Corrego Secco, which Dr George Gardner described in 1837 as "a small, miserable village." The first emperor planned to establish there a German colony, but the plan was not realized until 1845, when about 2700 colonists from Germany were located there. Its growth was slow, but the choice of the place by the emperor as a summer residence drew thither many of the wealthy residents of the capital. The Mauá railway was opened to the foot of the *serra* (Raiz da Serra) in 1854, and the macadamized road up the *serra* to the town in 1856. The mountain section of the railway, on the Riggenbach system, was completed in 1883. Petropolis has since become the summer residence of the diplomatic corps and of the higher officials of the Federal government, and was the capital of the state of Rio de Janeiro from 1893 to 1903.

PETROVSK, a seaport of Russia in Transcaucasia, on the Caspian Sea, in the province of Daghestan, 180 m. by rail E. of Vladikavkaz, and 235 m. N.W. from Baku. Pop. 9806. The town has become the port of embarcation for Krasnovodsk, the Transcaspian territory, and the Central Asian khanates. There are naphtha wells; and the hot sulphur baths at Ak-gol and Talga, close by, attract many visitors in summer.

PETROVSK, a town of eastern Russia, in the government of Saratov, on the Medvyeditsa, a tributary of the Don, 60 m. N.W. of the town of Saratov. Pop. (1864), 10,128; (1897), 13,212. It was founded by Peter the Great in 1698 as a defence against the Kuban Tatars. Its industrial establishments include distilleries, tanneries, tallow and brickworks.

PETROZAVODSK, a town and episcopal see of Russia, capital of the government of Olonets, on the west shore of Lake Onega, 190 m. N.E. of St Petersburg. Pop. (1865), 11,027; (1897), 12,521. Two cathedrals, built towards the end of the 18th century, a mining school, an ecclesiastical seminary and a government cannon-foundry are the chief public buildings and institutions. Peter the Great founded ironworks here in 1703, but they continued in operation only twenty-four years. The cannon-foundry was instituted in 1774. Petrozavodsk became the capital of the government of Olonets in 1802.

PETRUCCI, PANDOLFO (d. 1512), tyrant of Siena, spent the greater part of his youth in exile, on account of the civil strife by which his native town of Siena was torn; but on the triumph of the party of the *Noveschi* (those who supported the Council of Nine) in 1487 he was able to return home. On the death of his brother Giacopo, one of the most powerful men in the city, Pandolfo succeeded to all the latter's offices and emoluments (1497), thus becoming in fact if not in name master of Siena. By his marriage with Aurelia, daughter of Nicola Borghese, another very influential citizen, he still further strengthened his authority. But he soon began to abuse his power by selling public offices to

of a certain differential equation which generally bears his name, but which had originally been treated in a less complete manner by L. Euler (see DIFFERENTIAL EQUATIONS). The latter work contains an important addition to the theory of partial differential equations as it had been left by J. L. Lagrange.

His brother, JOHANN WILHELM ANDREAS PFAFF (1774–1835), was professor of pure and applied mathematics successively at Dorpat, Nuremberg, Würzburg and Erlangen. Another brother, CHRISTIAN HEINRICH PFAFF (1773–1852), graduated in medicine at Stuttgart in 1793, and from 1801 till his death was professor of medicine, physics and chemistry at the university of Kiel.

PFALZBURG, a town of Germany, in the imperial province of Alsace-Lorraine, lies high on the west slopes of the Vosges, 25 m. N.W. of Strassburg by rail. Pop. (1905), 3716. It contains an Evangelical and a Roman Catholic church, a synagogue and a teachers' seminary. Its industries include the manufacture of gloves, straw hats and liqueurs, and also quarrying.

The principality of Pfalzburg, of which this town was the capital, originally a part of Luxemburg, afterwards belonged in turn to the bishop of Metz, the bishop of Strassburg and the duke of Lorraine, and passed into the possession of France in 1661. The town was of importance as commanding the passes of the Vosges, and was strongly fortified by Vauban in 1680. The works resisted the Allies in 1814 and 1815, and the Germans for four months in 1870, but they were taken on the 12th of December of that year. They have since been razed.

PFEIFFER, FRANZ (1815–1868), German scholar, was born at Bettlach near Soleure on the 27th of February 1815. After studying at the university of Munich he went to Stuttgart, where in 1846 he became librarian to the royal library. In 1856 Pfeiffer founded the *Germania*, a quarterly periodical devoted to German antiquarian research. In 1857, having established his fame as one of the foremost authorities on German medieval literature and philology, he was appointed professor of these subjects at the university of Vienna; and in 1860 was made a member of the Imperial Academy of Sciences. He died at Vienna on the 29th of May 1868.

Among the many writings edited by him may be mentioned the *Barlaam und Josaphat* of Rudolf von Ems (1843), the *Edelstein* of Ulrich Boner (1844), *Die deutschen Mystiker des 14. Jahrhunderts* (1845–1857; new ed., 1906), the *Buch der Natur* of Konrad von Megenberg, a 14th-century writer (1861), *Die Predigten des Berthold von Regensburg* (1862), and the poems of Walther von der Vogelweide (1864; 6th ed. by K. Bartsch, 1880). Of his independent writings the most important are *Zur deutschen Literaturgeschichte, Über Wesen und Bildung der höfischen Sprache in mittelhochdeutscher Zeit, Der Dichter des Nibelungenliedes, Forschung und Kritik auf dem Gebiete des deutschen Altertums*, and *Altdeutsches Übungsbuch*. A biographical sketch by Karl Bartsch is in *Uhlands Briefwechsel mit Freiherrn von Lassberg*, edited by Franz Pfeiffer (1870).

PFEIFFER, IDA LAURA (1797–1858), Austrian traveller, daughter of a merchant named Reyer, was born at Vienna on the 14th of October 1797. In 1820 she married Dr Pfeiffer, a lawyer of Lemberg, who subsequently incurred official persecution and was reduced to poverty. In her later life Mme Pfeiffer devoted her limited means to travel. In 1842 she visited Palestine and Egypt, and published an account of her journey in *Reise einer Wienerin in das Heilige Land* (Vienna, 1843). In 1845 she set out to Scandinavia and Iceland, describing her tour in two volumes, *Reise nach dem skandinavischen Norden und der Insel Island* (Pest, 1846). In 1846 she started on a journey round the world, visiting Brazil, Chile and other countries of South America, Tahiti, China, India, Persia, Asia Minor and Greece, and reaching home in 1848. The results were published in *Eine Frauenfahrt um die Welt* (Vienna, 1850). In 1851 she went to England and thence to South Africa, intending to penetrate into the interior; this proved impracticable, but she proceeded to the Malay Archipelago, spending eighteen months in the Sunda Islands and the Moluccas. After a visit to Australia, Madame Pfeiffer proceeded to California, Oregon, Peru, Ecuador, New Granada, the Missiones Territory, and north again to the Great Lakes, reaching home in 1854. Her narrative, *Meine zweite Weltreise*, was published at Vienna in 1856. In May of the same year she set out to explore Madagascar, where at first she was cordially received by the queen. But she unwittingly allowed herself to be involved in a plot to overthrow the government, and was expelled the country. She died at Vienna on the 27th of October 1858.

The *Reise nach Madagascar* was issued in 1861 (Vienna), with a biography by her son.

PFLEIDERER, OTTO (1839–1908), German Protestant theologian, was born at Stetten near Cannstadt in Württemberg on the 1st of September 1839. From 1857 to 1861 he studied at Tübingen under F. C. Baur; and afterwards in England and Scotland. He then entered the ministry, became *repetent* at Tübingen, and for a short time held a pastorate at Heilbronn (1868). In 1870 he became chief pastor and superintendent at Jena and soon afterwards professor ordinarius of theology, but in 1875 he was called to the chair of systematic theology at Berlin, having made his name by a series of articles on New Testament criticism and Johannine and Pauline theology, which appeared in Adolf Hilgenfeld's *Zeitschrift für wissenschaftliche Theologie*, and by his *Der Paulinismus*, published in 1873 (2nd ed., 1890; Eng. trans., *Paulinism: a Contribution to the History of Primitive Christian Theology*, 2 vols., 1873, &c.). *Das Urchristentum, seine Schriften und Lehren, in geschichtlichem Zusammenhang beschrieben* was published in 1878 and considerably enlarged for a second edition in 1902 (Eng. trans., 1906). In 1890 appeared *The Development of Theology since Kant, and its Progress in Great Britain since 1825*, which was written for publication in England. A more elaborate work was his *Religionsphilosophie auf geschichtlichen Grundlage* (1878; 2nd ed., enlarged, 1883–1884; Eng. trans., from 2nd German ed., *The Philosophy of Religion on the Basis of its History*, 4 vols., 1886–1888). "The Influence of the Apostle Paul on the Development of Christianity" was the title of a course of Hibbert Lectures given in London in 1885. In 1894 he delivered the Gifford Lectures at Edinburgh, the subject being "The Philosophy and Development of Religion." His later publications included: *The Early Christian Conception of Christ* (1905), *Die Entstehung des Christentums* (1905; Eng. trans., 1906), *Religion und Religionen* (1906; Eng. trans., 1907), and *Die Entwicklung des Christentums* (1907). He died on the 18th of July 1908, at Gross Lichterfelde, near Berlin. In New Testament criticism Pfleiderer belonged to the critical school which grew out of the impulse given by F. C. Baur. But, like other modern German theologians, he showed a greater disposition to compromise. All his work shows a judicial tone of mind, and is remarkable for the charm of its style.

Pfleiderer's younger brother EDMUND (1842–1902) distinguished himself both in philosophy and theology. He too entered the ministry (1864) and during the Franco-German War served as army chaplain, an experience described in his *Erlebnisse eines Feldgeistlichen* (1890). He was afterwards appointed professor ordinarius of philosophy at Kiel (1873), and in 1878 he was elected to the philosophical chair at Tübingen. He published works on Leibnitz, empiricism and scepticism in Hume's philosophy, modern pessimism, Kantic criticism, English philosophy, Heraclitus of Ephesus and many other subjects.

PFORTA, or SCHULPFORTA, formerly a Cistercian monastery dating from 1140, and now a celebrated German public school. It is in the Prussian province of Saxony, on the Saale, 2 m. S.W. of Naumburg. The remains of the monastery include the 13th century Gothic church, recently restored, the Romanesque chapel (12th century) and other buildings now used as dormitories, lecture rooms, &c. There is also the Fürstenhaus, built in 1573. Schulpforta was one of the three *Fürstenschulen* founded in 1543 by Maurice duke, and later elector, of Saxony, the two others being at Grimma and at Meissen. The property of the dissolved monastery provided a good revenue for the new educational foundation, which now amounts to about £15,000 a year. Free education is provided for 140 boys, the total number of pupils being 185. After being in the possession of Saxony, Pforta passed to Prussia in 1815, and since this date the school has been entirely reorganized.

PFORZHEIM, a town of Germany, in the grand duchy of Baden, at the confluence of the Nagold and the Enz, on the northern margin of the Black Forest, 19 m. S.E. of Karlsruhe by rail, and at the junction of lines to Wildbad and Ettlingen. Pop. (1895), 33,345; (1905), 59,395, most of whom are Protestants. Its most interesting buildings are the old palace of the margraves of Baden, and the Schlosskirche, the latter an edifice of the 12th–15th centuries, containing the tombs and monuments of the margraves. Pforzheim is the chief centre in Germany for the manufacture of gold and silver ornaments and jewelry, an industry which gives employment to about 22,000 hands, besides which there are iron and copper works, and manufactures of chemicals, paper, leather, machinery, &c. A brisk trade is maintained in timber, cattle and agricultural produce.

Pforzheim (Porta Hercyniae) is of Roman origin. From about 1300 to 1565 it was the seat of the margraves of Baden. It was taken by the troops of the Catholic League in 1624, and was destroyed by the French in 1689. The story of the 400 citizens of Pforzheim who sacrificed themselves for their prince after the battle of Wimpfen in May 1622 has been relegated by modern historical research to the domain of legend.

See Coste, *Die 400 Pforzheimer* (1879); Brombacher, *Der Tod der 400 Pforzheimer* (Pforzheim, 1886); Stolz, *Geschichte der Stadt Pforzheim* (Pforzheim, 1901).

PHAEDO, Greek philosopher, founder of the Elian school, was a native of Elis, born in the last years of the 5th century B.C. In the war of 401–400 between Sparta and Elis he was taken prisoner and became a slave in Athens, where his beauty brought him notoriety. He became a pupil of Socrates, who conceived a warm affection for him. It appears that he was intimate with Cebes and Plato, and he gave his name to one of Plato's dialogues. Athenaeus relates, however, that he resolutely declined responsibility for any of the views with which Plato credits him, and that the relations between him and Plato were the reverse of friendly. Aeschines also wrote a dialogue called *Phaedo.* Shortly after the death of Socrates Phaedo returned to Elis, where his disciples included Anchipylus, Moschus and Pleistanus, who succeeded him. Subsequently Menedemus and Asclepiades transferred the school to Eretria, where it was known as the Eretrian school and is frequently identified (*e.g.* by Cicero) with the Megarians. The doctrines of Phaedo are not known, nor is it possible to infer them from the Platonic dialogue. His writings, none of which are preserved, were in the form of dialogues. As to their authenticity nothing is known, in spite of an attempt at selection by Panaetius (Diog. Laërt. ii. 64), who maintains that the *Zopyrus* and the *Simon* are genuine. Seneca has preserved one of his dicta (*Epist.* 94. 41), namely that one method of acquiring virtue is to frequent the society of good men.

See Wilamowitz, *Hermes*, xiv. 189 seq.

PHAEDRA, in Greek legend, daughter of Minos and Pasiphaë. With her sister Ariadne she was carried off by Theseus to Athens, and became his wife. On the way to Eleusis she met Hippolytus, son of Theseus by a former wife (Hippolyte, queen of the Amazons, or her sister Antiope), and fell in love with him. Finding her advances rejected, she hanged herself, leaving behind a letter in which she accused Hippolytus of having made dishonourable proposals. The same story, in the main, is told of Bellerophon and Anteia. It formed the subject of tragedies by Sophocles, Euripides (two, one of which is extant), Seneca and Racine.

PHAEDRUS, Roman fabulist, was by birth a Macedonian and lived in the reigns of Augustus, Tiberius, Gaius and Claudius. According to his own statement (prologue to book iii.), not perhaps to be taken too literally, he was born on the Pierian Mountain, but he seems to have been brought at an early age to Italy, for he mentions that he read a verse of Ennius as a boy at school. According to the heading of the chief MS. he was a slave and was freed by Augustus. He incurred the wrath of Sejanus, the powerful minister of Tiberius, by some supposed allusions in his fables, and was brought to trial and punished. We learn this from the prologue to the third book, which is dedicated to Eutychus, who has been identified with the famous charioteer and favourite of Gaius. The fourth book is dedicated to Particulo, who seems to have dabbled in literature. The dates of their publication are unknown, but Seneca, writing between A.D. 41 and 43 (*Consol. ad Polyb.* 27), knows nothing of Phaedrus, and it is probable that he had published nothing then. His work shows little or no originality; he simply versified in iambic trimeters the fables current in his day under the name of "Aesop," interspersing them with anecdotes drawn from daily life, history and mythology. He tells his fable and draws the moral with businesslike directness and simplicity; his language is terse and clear, but thoroughly prosaic, though it occasionally attains a dignity bordering on eloquence. His Latin is correct, and, except for an excessive and peculiar use of abstract words, shows hardly anything that might not have been written in the Augustan age. From a literary point of view Phaedrus is inferior to Babrius, and to his own imitator, La Fontaine; he lacks the quiet picturesqueness and pathos of the former, and the exuberant vivacity and humour of the latter. Though he frequently refers to the envy and detraction which pursued him, Phaedrus seems to have attracted little attention in antiquity. He is mentioned by Martial (iii. 20, 5), who imitated some of his verses, and by Avianus. Prudentius must have read him, for he imitates one of his lines (Prud. *Cath.* vii. 115; cf. Phaedrus, iv. 6, 10).

The first edition of the five books of Phaedrus was published by Pithou at Troyes in 1596 from a manuscript now in the possession of the marquis of Rosanbo. In the beginning of the 18th century there was discovered at Parma a MS. of Perotti (1430–1480), archbishop of Siponto, containing sixty-four fables of Phaedrus, of which some thirty were new. These new fables were first published at Naples by Cassitto in 1808, and afterwards (much more correctly) by Jannelli in 1809. Both editions were superseded by the discovery of a much better preserved MS. of Perotti in the Vatican, published by Angelo Mai in 1831. For some time the authenticity of these new fables was disputed, but they are now generally accepted, and with justice, as genuine fables of Phaedrus. They do not form a sixth book, for we know from Avianus that Phaedrus wrote five books only, but it is impossible to assign them to their original places in the five books. They are usually printed as an appendix.

In the middle ages Phaedrus exercised a considerable influence through the prose versions of his fables which were current, though his own works and even his name were forgotten. Of these prose versions the oldest existing seems to be that known as the "Anonymus Nilanti," so called because first edited by Nilant at Leiden in 1709 from a MS. of the 13th century. It approaches the text of Phaedrus so closely that it was probably made directly from it. Of the sixty-seven fables which it contains thirty are derived from lost fables of Phaedrus. But the largest and most influential of the prose versions of Phaedrus is that which bears the name of *Romulus.* It contains eighty-three fables, is as old as the 10th century, and seems to have been based on a still earlier prose version, which, under the name of "Aesop," and addressed to one Rufus, may have been made in the Carolingian period or even earlier. About this *Romulus* nothing is known. The collection of fables in the Weissenburg (now Wolfenbüttel) MS. is based on the same version as *Romulus.* These three prose versions contain in all one hundred distinct fables, of which fifty-six are derived from the existing and the remaining forty-four presumably from lost fables of Phaedrus. Some scholars, as Burmann, Dressler and L. Müller, have tried to restore these lost fables by versifying the prose versions.

The collection bearing the name of *Romulus* became the source from which, during the second half of the middle ages, almost all the collections of Latin fables in prose and verse were wholly or partially drawn. A 12th-century version of the first three books of *Romulus* in elegiac verse enjoyed a wide popularity, even into the Renaissance. Its author (generally referred to since the edition of Névelet in 1610 as the "Anonymus Neveleti") was long unknown, but Hervieux has shown grounds for identifying him with Walther of England, chaplain to Henry II. and afterwards archbishop of Palermo.

Another version of *Romulus* in Latin elegiacs was made by Alexander Neckam, born at St Albans in 1157. Amongst the collections partly derived from *Romulus* the most famous is probably that in French verse by Marie de France. About 1200 a collection of fables in Latin prose, based partly on *Romulus*, was made by the Cistercian monk Odo of Sherrington; they have a strong medieval and clerical tinge. In 1370 Gerard of Minden wrote a poetical version of *Romulus* in Low German.

Since Pithou's edition in 1596 Phaedrus has been often edited and translated; among the editions may be mentioned those of Burmann (1718 and 1727), Bentley (1726), Schwabe (1806), Berger de Xivrey (1830), Orelli (1832), Eyssenhardt (1867), L. Müller (1877), Rica (1885), and above all that of L. Havet (Paris, 1895). For the

of a certain differential equation which generally bears his name, but which had originally been treated in a less complete manner by L. Euler (see DIFFERENTIAL EQUATIONS). The latter work contains an important addition to the theory of partial differential equations as it had been left by J. L. Lagrange.

His brother, JOHANN WILHELM ANDREAS PFAFF (1774–1835), was professor of pure and applied mathematics successively at Dorpat, Nuremberg, Würzburg and Erlangen. Another brother, CHRISTIAN HEINRICH PFAFF (1773–1852), graduated in medicine at Stuttgart in 1793, and from 1801 till his death was professor of medicine, physics and chemistry at the university of Kiel.

PFALZBURG, a town of Germany, in the imperial province of Alsace-Lorraine, lies high on the west slopes of the Vosges, 25 m. N.W. of Strassburg by rail. Pop. (1905), 3716. It contains an Evangelical and a Roman Catholic church, a synagogue and a teachers' seminary. Its industries include the manufacture of gloves, straw hats and liqueurs, and also quarrying.

The principality of Pfalzburg, of which this town was the capital, originally a part of Luxemburg, afterwards belonged in turn to the bishop of Metz, the bishop of Strassburg and the duke of Lorraine, and passed into the possession of France in 1661. The town was of importance as commanding the passes of the Vosges, and was strongly fortified by Vauban in 1680. The works resisted the Allies in 1814 and 1815, and the Germans for four months in 1870, but they were taken on the 12th of December of that year. They have since been razed.

PFEIFFER, FRANZ (1815-1868), German scholar, was born at Bettlach near Soleure on the 27th of February 1815. After studying at the university of Munich he went to Stuttgart, where in 1846 he became librarian to the royal library. In 1856 Pfeiffer founded the *Germania*, a quarterly periodical devoted to German antiquarian research. In 1857, having established his fame as one of the foremost authorities on German medieval literature and philology, he was appointed professor of these subjects at the university of Vienna; and in 1860 was made a member of the Imperial Academy of Sciences. He died at Vienna on the 29th of May 1868.

Among the many writings edited by him may be mentioned the *Barlaam und Josaphat* of Rudolf von Ems (1843), the *Edelstein* of Ulrich Boner (1844), *Die deutschen Mystiker des 14. Jahrhunderts* (1845–1857; new ed., 1906), the *Buch der Natur* of Konrad von Megenberg, a 14th-century writer (1861), *Die Predigten des Berthold von Regensburg* (1862), and the poems of Walther von der Vogelweide (1864; 6th ed. by K. Bartsch, 1880). Of his independent writings the most important are *Zur deutschen Literaturgeschichte*, *Über Wesen und Bildung der höfischen Sprache in mittelhochdeutscher Zeit*, *Der Dichter des Nibelungenliedes*, *Forschung und Kritik auf dem Gebiete des deutschen Altertums*, and *Altdeutsches Übungsbuch*. A biographical sketch by Karl Bartsch is in *Uhlands Briefwechsel mit Freiherrn von Lassberg*, edited by Franz Pfeiffer (1870).

PFEIFFER, IDA LAURA (1797–1858), Austrian traveller, daughter of a merchant named Reyer, was born at Vienna on the 14th of October 1797. In 1820 she married Dr Pfeiffer, a lawyer of Lemberg, who subsequently incurred official persecution and was reduced to poverty. In her later life Mme Pfeiffer devoted her limited means to travel. In 1842 she visited Palestine and Egypt, and published an account of her journey in *Reise einer Wienerin in das Heilige Land* (Vienna, 1843). In 1845 she set out to Scandinavia and Iceland, describing her tour in two volumes, *Reise nach dem skandinavischen Norden und der Insel Island* (Pest, 1846). In 1846 she started on a journey round the world, visiting Brazil, Chile and other countries of South America, Tahiti, China, India, Persia, Asia Minor and Greece, and reaching home in 1848. The results were published in *Eine Frauenfahrt um die Welt* (Vienna, 1850). In 1851 she went to England and thence to South Africa, intending to penetrate into the interior; this proved impracticable, but she proceeded to the Malay Archipelago, spending eighteen months in the Sunda Islands and the Moluccas. After a visit to Australia, Madame Pfeiffer proceeded to California, Oregon, Peru, Ecuador, New Granada, the Missiones Territory, and north again to the Great Lakes, reaching home in 1854. Her narrative, *Meine zweite Weltreise*, was published at Vienna in 1856. In May of the same year she set out to explore Madagascar, where at first she was cordially received by the queen. But she unwittingly allowed herself to be involved in a plot to overthrow the government, and was expelled the country. She died at Vienna on the 27th of October 1858.

The *Reise nach Madagascar* was issued in 1861 (Vienna), with a biography by her son.

PFLEIDERER, OTTO (1839–1908), German Protestant theologian, was born at Stetten near Cannstadt in Württemberg on the 1st of September 1839. From 1857 to 1861 he studied at Tübingen under F. C. Baur; and afterwards in England and Scotland. He then entered the ministry, became *repetent* at Tübingen, and for a short time held a pastorate at Heilbronn (1868). In 1870 he became chief pastor and superintendent at Jena and soon afterwards professor ordinarius of theology, but in 1875 he was called to the chair of systematic theology at Berlin, having made his name by a series of articles on New Testament criticism and Johannine and Pauline theology, which appeared in Adolf Hilgenfeld's *Zeitschrift für wissenschaftliche Theologie*, and by his *Der Paulinismus*, published in 1873 (2nd ed., 1890; Eng. trans., *Paulinism: a Contribution to the History of Primitive Christian Theology*, 2 vols., 1873, &c.). *Das Urchristentum, seine Schriften und Lehren, in geschichtlichem Zusammenhang beschrieben* was published in 1878 and considerably enlarged for a second edition in 1902 (Eng. trans., 1906). In 1890 appeared *The Development of Theology since Kant, and its Progress in Great Britain since 1825*, which was written for publication in England. A more elaborate work was his *Religionsphilosophie auf geschichtlichen Grundlage* (1878; 2nd ed., enlarged, 1883–1884; Eng. trans., from 2nd German ed., *The Philosophy of Religion on the Basis of its History*, 4 vols., 1886–1888). "The Influence of the Apostle Paul on the Development of Christianity" was the title of a course of Hibbert Lectures given in London in 1885. In 1894 he delivered the Gifford Lectures at Edinburgh, the subject being "The Philosophy and Development of Religion." His later publications included: *The Early Christian Conception of Christ* (1905), *Die Entstehung des Christentums* (1905; Eng. trans., 1906), *Religion und Religionen* (1906; Eng. trans., 1907), and *Die Entwicklung des Christentums* (1907). He died on the 18th of July 1908, at Gross Lichterfelde, near Berlin. In New Testament criticism Pfleiderer belonged to the critical school which grew out of the impulse given by F. C. Baur. But, like other modern German theologians, he showed a greater disposition to compromise. All his work shows a judicial tone of mind, and is remarkable for the charm of its style.

Pfleiderer's younger brother EDMUND (1842–1902) distinguished himself both in philosophy and theology. He too entered the ministry (1864) and during the Franco-German War served as army chaplain, an experience described in his *Erlebnisse eines Feldgeistlichen* (1890). He was afterwards appointed professor ordinarius of philosophy at Kiel (1873), and in 1878 he was elected to the philosophical chair at Tübingen. He published works on Leibnitz, empiricism and scepticism in Hume's philosophy, modern pessimism, Kantic criticism, English philosophy, Heraclitus of Ephesus and many other subjects.

PFORTA, or SCHULPFORTA, formerly a Cistercian monastery dating from 1140, and now a celebrated German public school. It is in the Prussian province of Saxony, on the Saale, 2 m. S.W. of Naumburg. The remains of the monastery include the 13th century Gothic church, recently restored, the Romanesque chapel (12th century) and other buildings now used as dormitories, lecture rooms, &c. There is also the Fürstenhaus, built in 1573. Schulpforta was one of the three *Fürstenschulen* founded in 1543 by Maurice duke, and later elector, of Saxony, the two others being at Grimma and at Meissen. The property of the dissolved monastery provided a good revenue for the new educational foundation, which now amounts to about £15,000 a year. Free education is provided for 140 boys, the total number of pupils being 185. After being in the possession of Saxony, Pforta passed to Prussia in 1815, and since this date the school has been entirely reorganized.

in connexion with the removal of cell débris resulting from any injury. Numbers of phagocytes may be found at work in this direction, for instance in the pus formed within an aseptic abscess. Hence we may regard the phagocytes as acting as the scavengers of the tissues.

In the instances we have been dealing with the phagocytes are chiefly of the class of wandering cells and are brought to the seat of their activity by the blood. In examining any tissue where the process is going on it is seen that the phagocytes have accumulated there in large numbers. They have been attracted to the damaged area. The mechanism which effects this attraction is a chemical one—chemiotaxis. At the seat of the change chemical substances are produced which act upon the phagocytes, causing them to migrate towards the source—positive chemiotaxis. Apparently the material dissolving from cell débris can act in this manner. Thus if a capillary tube filled with a tissue extract be inserted under the skin of an animal, within a short time it will be found to be surrounded with numbers of leucocytes, which may also have encroached into the tube itself. As in other instances of chemiotaxis the same chemical stimulus in a higher concentration may repel the cells—negative chemiotaxis. Instances of this are especially frequent in relation to micro-organisms and phagocytes, to which we may now turn.

That phagocytes can paralyse, kill and digest many micro-organisms is the main fact in Metchnikoff's theory of the nature of immunity. The reaction may be readily studied by injecting a small quantity of a fluid culture of some mildly pathogenic organism into the peritoneal cavity of an animal, and in the course of an hour or so examining a smear from the surface of the omentum, when an abundance of phagocytes enclosing the organism in different stages of digestion will be found. Or we may adopt Leishman's method, in which a few drops of human blood are diluted with saline solution and centrifuged. The layer of white corpuscles is pipetted off, suspended in serum, and a minute drop of a suspension of a pathogenic organism is added. The preparation is then incubated at 37° C. for a quarter of an hour. Upon examining a drop of this mixture a number of bacteria are found within the phagocytes. Thus this attack and destruction of bacteria by phagocytes may take place within the body or by cells removed from the body. Whether or no a phagocyte can engulf bacteria is dependent upon a number of factors—partly specific properties of the phagocyte, partly factors varying with the constitution of the body serum. Thus Wright and Douglas, employing Leishman's method, have proved that leucocytes do not take up bacteria freely unless the serum in which they are suspended contain opsonins. They found, for example, that leucocytes taken from a patient suffering from a pyococci infection if suspended in normal human serum take up the cocci abundantly, whereas if the same leucocytes are suspended under similar conditions in the patient's own serum the reaction may be almost absent. Further, leucocytes taken from a normal individual and suspended in the patient's serum are practically inactive, while the same phagocytes in normal serum are very active. Exactly how the substance in the serum acts is undecided, but it has been proved that there are in serum substances which become fixed to bacteria and which render them an easier prey to the phagocytes. This specific opsonin is used up when the bacteria are added to the serum, so that if the bacteria are subsequently removed the serum is no longer active. There is evidence too that there is a multiplicity of opsonins. As to the origin of the opsonins we have no certain evidence. It is suggested that they are a secretion from the leucocytes themselves and that it is an evidence of another and preliminary mode of attack possessed by the leucocyte, viz. the discharge of a secretion from the cell which is to damage or paralyse the bacterium and thus enable the phagocyte to engulf it.

The mechanism of destruction of a bacterium once it has been taken up by a phagocyte is probably, just as in the instance of dead cellular material, one of intracellular digestion. The bacterium before being engulfed is probably inert in most instances, though it may yet prove too strong for the phagocyte. The next stage we can trace is the formation of a vacuole around the organism, or, if the latter be large, around a part of the organism, and the part thus surrounded quickly shows signs of destruction. For instance, its staining reactions become weaker. When a part only of the organism is surrounded by a vacuole the part thus surrounded soon ceases to stain, while the remaining part stains normally, and we thus have a marked contrast evidencing the two stages.

In the next place we must ask which are the cells possessing phagocytic powers? Leaving apart the cells lining the alimentary tract (because we know practically nothing of their power in this respect) a number of free cells possess amoeboid properties as well as also a number of fixed cells. These latter are attached to certain spots of a tissue, but are capable of throwing out processes which can seize upon particles of foreign matter or even upon certain elements of the same organism. Of this category Metchnikoff distinguishes the nerve cells, the large cells of the spleen pulp and of lymph glands, certain endothelial cells, the neuroglia cells, and perhaps certain cells of connective tissues. All these elements can under certain conditions act as phagocytes, and with the exception of the nerve cells all are of mesoblastic origin. Those of greater importance on account of their greater activity in this respect are the large splenic and lymph cells, the neuroglia cells and certain endothelial cells. With regard to the wandering cells Metchnikoff considers that some are certainly non-phagocytic, for instance the lymphocytes. According to Metchnikoff it is only when these cells become older and have developed a nucleus rich in chromatin and an abundant cell body that these cells develop phagocytic properties. This is the large hyaline leucocyte. The polymorphonuclear and the eosinophil leucocyte are both phagocytes. Metchnikoff therefore divides the phagocytes into two classes—the microphages, comprising the polymorphonuclear and the eosinophil cell, and the macrophages, containing the large hyaline cell, the cell of the splenic pulp, the endothelial cell and the neuroglia cell. From further observation of these cells he concludes that the microphages are chiefly concerned in opposing the micro-organisms of acute infections, whereas the macrophages are chiefly concerned in combating chronic infections. It is the macrophage also which is concerned in removing cell débris, *e.g.* red corpuscles from a haemorrhage or the red corpuscles of another animal which may have been introduced experimentally.

Metchnikoff and his co-workers have shown that the two principal groups of leucocytes are generally spread throughout the vertebrates. Thus instances of each kind are found even in the lamprey, though here their staining properties are feebler; also cells which show but small differences from the analogous cells of mammals are found in the alligator. (T. G. Br.)

PHALANGER, a book-name applied to the more typical representatives of the group of diprotodont marsupial mammals, including the cuscuses of the Moluccas and Celebes, and the so-called opossums of Australia, and thus collectively the whole family Phalangeridae. (See MARSUPIALIA.)

Phalangers generally are small or medium-sized woolly-coated marsupials, with long, powerful, and often prehensile tails, large claws, and opposable nailless first hind toes. They seem in the day to be dull and sleepy, but are alert at night. They live mostly upon fruits, leaves and blossoms, although a few feed habitually upon insects, and all relish, in confinement, an occasional bird or other small animal. Several possess flying-membranes stretched between their fore and hind limbs, by the help of which they can make long and sustained leaps through the air, like flying-squirrels; but the possession of these flying-membranes does not seem to be any indication of special affinity, the characters of the skull and teeth sharply dividing the flying forms and uniting them with other species of the non-flying groups. The skull (see fig. 1) is, as a rule, broad and flattened with the posterior part swollen out laterally owing to the numerous air-cells situated in the substance of the squamosal bones. The dental formula is very variable, especially as regard the premolars, of which some at least in each genus are reduced to functionless rudiments, and may even vary in number on the two sides of the jaw of the same individual. The incisors are

always $\frac{3}{1}$, the lower one very large and inclined forwards, and the canines normally $\frac{1}{1}$, of which the inferior is always minute, and in one genus generally absent. The molars number either $\frac{3}{3}$ or $\frac{2}{2}$. All the species here discussed are included in the sub-family Phalangeridae, of which the distinctive features, as well as those of the family Phalangeridae, are referred to under MARSUPIALIA.

The most generalized representatives of the group appear to be the ring-tailed phalangers, constituting the genus *Pseudochirus*, which is common to Australia, Tasmania and New Guinea, and

FIG. 1.—Skull of Grey Cuscus (*Phalanger orientalis*).

includes at least half a score of species. The dentition is generally *i.* $\frac{3}{2}$, *c.* $\frac{1}{0}$, *p.* + *m.* $\frac{7}{7}$, but one upper incisor and the canine may be wanting. The crowns of the molars show a crescentic structure, but they are said to retain the three primitive cusps, which are fused in the other genera. The prehensile tail has its tip naked for a short distance, and the whole of the terminal third and the under surface of the remainder short haired, the tip being generally white. The hair is thick and woolly, and generally yellowish-olive in colour. These phalangers are the ring-tailed opossums of the Australians. From this genus is apparently derived the taguan flying-squirrel, or flying-phalanger (*Petauroides volans*), which ranges from Queensland to Victoria, and is the largest of the flying group. Its dentition is essentially similar to that of *Pseudochirus*, although there is one pair less of cheek-teeth, and the bushy tail is naked and prehensile at the tip. Reverting to the non-flying species, we have *Gymnobelideus leadbeateri*, a small animal from Victoria representing a genus by itself, with the same dental formula as *Pseudochirus*, but cheek-teeth of a different type, the ears naked (instead of hairy) behind, glands on the chest and between the ears, and the tail long and evenly bushy to the tip. From this are evidently derived the flying-phalangers—flying-squirrels—of the genus *Petaurus*, which differ merely in the possession of a parachute, and are represented by several species, ranging from Australia (exclusive of Tasmania) to the Aru Islands, New Guinea, and New Ireland. Of the yellow-bellied species, *P. australis*, the habits are described by J. Gould as follows: "This animal is common in all the brushes of New South Wales, particularly those which stretch along the coast from Port Philip to Moreton Bay. In these vast forests trees of one kind or another are perpetually flowering, and thus offer a never-failing supply of the blossoms upon which it feeds; the flowers of the various kinds of gums, some of which are of great magnitude, are the principal favourites. Like the rest of the genus, it is nocturnal in its habits, dwelling in holes and in the spouts of the larger branches during the day, and displaying the greatest activity at night while running over the small leafy branches, frequently even to their very extremities, in search of insects and the honey of the newly opened blossoms. Its structure being ill adapted for terrestrial habits, it seldom descends to the ground except for the purpose of passing to a tree too distant to be attained by springing from the one it wishes to leave. The tops of the trees are traversed by this animal with as much ease as the most level ground is by such as are destined for terra firma. If chased or forced to flight it ascends to the highest branch and performs the most enormous leaps, sweeping from tree to tree with wonderful address; a slight elevation gives its body an impetus which with the expansion of its membrane enables it to pass to a considerable distance, always ascending a little at the extremity of the leap; by this ascent the animal is prevented from receiving the shock which it would otherwise sustain."

A second species, *P. sciureus*, in some ways one of the most beautiful of all mammals, is shown in fig. 2.

A precisely similar relationship exists between the tiny feather-tailed phalanger, *Distoechurus pennatus*, of New Guinea, and the equally minute pigmy flying-phalanger or flying-mouse, *Acrobates pygmaeus*, of Queensland, New South Wales and Victoria; both being characterized by the hairs of the tail forming a vane on each side, as well as by tufts of long hairs at the base of the thinly haired ears. There are six pairs of cheek-teeth, of which the last three are small and rounded, with blunted cusps, while the anterior teeth are sharp and of insectivorous type. The pigmy flying-phalanger feeds on honey from flowers and insects.

To some extent intermediate in structure between *Acrobates* and *Petaurus*, although without a parachute, are the beautiful little dormouse-phalangers, as typified by *Dromicia nana*, which range from Western Australia and Tasmania to New Guinea. They appear to be a generalized type, which has died out where they have come into competition with the more specialized forms. Although unable to fly they are exceedingly active, and take long leaps from bough to bough; externally they are characterized by their dormouse-

FIG. 2.—Squirrel Flying-Phalanger (*Petaurus sciureus*).

like form, large, thin, and nearly naked ears, without tufts inside or at the base, sharp and rudimentary front claws and long sharp hind ones, and mouse-like tail, which is furry at the base, then scaly, and naked and prehensile at the tip. There may be either six or seven pairs of cheek-teeth, of which the hinder carry four small smooth cusps, and the first upper incisor is much longer than the other two. The striped phalangers (*Dactylopsila*) are larger animals, of the approximate size of a squirrel, easily recognized by the longitudinal yellow and black striping of the fur, and the slender and elongated fourth front toe. The typical *D. trivirgata* is common to north Australia and New Guinea, but *D. palpator*, which has the fourth toe still more elongated, is exclusively Papuan. They have seven pairs of cheek-teeth, of which the four last are oblong and four-cusped; and the first lower incisor is longer than in any other phalanger. They apparently feed on both leaves and grubs, probably extracting the latter from crannies with the elongated toe. The tail is more or less bare on the under side of the tip.

The last group of the sub-family is represented firstly by the cuscuses, or cususes (*Phalanger*), which are arboreal animals of the approximate size of cats, and range from the Solomon Islands through New Guinea and the Moluccas to Celebes, being, in fact, the only Old World marsupials found westwards of New Guinea. Externally they are characterized by their thick woolly fur, short or medium ears, which are hairy outside, and sometimes inside as well, by the naked and striated soles of the feet, and the long and markedly prehensile tail, of which the basal half is furred like the body, and the terminal half entirely naked. The number of cheek-teeth varies, owing to the frequent absence of some of the front ones, but there are generally seven pairs, of which the last four carry crescents internally and cusps externally. About ten species are known, of which the grey cuscus (*P. orientalis*) of Amboyna and Timor was discovered about 300 years ago, and was thus the first known Old World marsupial. In the spotted cuscus (*P. maculatus*) the males are marked with orange and white, while the females are uniformly greyish. Cuscuses are sleepy animals, feeding mainly on leaves, but also devouring birds and small mammals.

Nearly allied to the cuscuses are the typical Australian phalangers, or opossums, forming the genus *Trichosurus*. They differ from the cuscuses, among other features, by the thick and non-tapering tail being covered with bushy hair up to the extreme tip, which is naked, as is a narrow line along the middle of the terminal third

(or rather more) of the lower sarface, by the presence of a gland on the chest, and by the soles of the hind feet being hairy. In the skull the upper canine is separated from the outermost incisor, instead of close to it as in the cascuses (fig. 1). The best-known species is the brush-tailed phalanger, or brush-tailed opossum (*T. vulpecula*), of Australia, an animal of the size of a small fox, represented in Tasmania by the brown phalanger (*T. vulpecula fuliginosus*). The short-eared phalanger (*T. canina*) represents the group in Southern Queensland and New South Wales. The dental formula in both is *i.* $\frac{3}{2}$, *c.* $\frac{1}{0}$, *p.* $\frac{2}{1}$, *m.* $\frac{4}{4}$. These animals are wholly arboreal and mainly nocturnal in their habits; and it is these which form the chief game in "opossum-shooting" among the gum-trees by moonlight.

The long-snouted phalanger is referred to under MARSUPIALIA. (R. L.*)

PHALANX (Gr. *φάλαγξ*, of unknown origin), the name, in Greek history of the arrangement of heavy-armed infantry in a single close mass of spearmen (see ARMY: *History*). In anatomy, the Latin plural *phalanges* is the term applied to the bones of the finger and toe, and in botany to a group of united stamen clusters. The term "phalanx" was adopted by F. C. M. Fourier (*q.v.*) as the name of the socialistic community living in a "phalanstery."

PHALARIS, tyrant of Acragas (Agrigentum) in Sicily, *c.* 570–554 B.C. He was entrusted with the building of the temple of Zeus Atabyrius in the citadel, and took advantage of his position to make himself despot (Aristotle, *Politics*, v. 10). Under his rule Agrigentum seems to have attained considerable prosperity. He supplied the city with water, adorned it with fine buildings, and strengthened it with walls. On the northern coast of the island the people of Himera elected him general with absolute power, in spite of the warnings of the poet Stesichorus (Aristotle, *Rhetoric*, ii. 20). According to Suïdas he succeeded in making himself master of the whole of the island. He was at last overthrown in a general rising headed by Telemachus, the ancestor of Theron (tyrant *c.* 488–472), and burned in his brazen bull.

After ages have held up Phalaris to infamy for his excessive cruelty. In his brazen bull, invented, it is said, by Perillus of Athens, the tyrant's victims were shut up and, a fire being kindled beneath, were roasted alive, while their shrieks represented the bellowing of the bull. Perillus himself is said to have been the first victim. There is hardly room to doubt that we have here a tradition of human sacrifice in connexion with the worship of the Phoenician Baal (Zeus Atabyrius) such as prevailed at Rhodes; when misfortune threatened Rhodes the brazen bulls in his temple bellowed. The Rhodians brought this worship to Gela, which they founded conjointly with the Cretans, and from Gela it passed to Agrigentum. Human sacrifices to Baal were common, and, though in Phoenicia proper there is no proof that the victims were burned alive, the Carthaginians had a brazen image of Baal, from whose down-turned hands the children slid into a pit of fire; and the story that Minos had a brazen man who pressed people to his glowing breast points to similar rites in Crete, where the child-devouring Minotaur must certainly be connected with Baal and the favourite sacrifice to him of children.

The story of the bull cannot be dismissed as pure invention. Pindar (*Pythia*, i. 185), who lived less than a century afterwards, expressly associates this instrument of torture with the name of the tyrant. There was certainly a brazen bull at Agrigentum, which was carried off by the Carthaginians to Carthage, whence it was again taken by Scipio and restored to Agrigentum. In later times the tradition prevailed that Phalaris was a naturally humane man and a patron of philosophy and literature. He is so described in the declamations ascribed to Lucian, and in the letters which bear his own name. Plutarch, too, though he takes the unfavourable view, mentions that the Sicilians gave to the severity of Phalaris the name of justice and a hatred of crime. Phalaris may thus have been one of those men who combine justice and even humanity with religious fanaticism (Suïdas, *s.v.*; Diod. Sic. ix. 20, 30, xiii. 90, xxxii. 25; Polybius vii. 7, xii. 25; Cicero, *De Officiis*, ii. 7, iii. 6).

The letters bearing the name of Phalaris (148 in number) are now chiefly remembered for the crushing exposure they received at the hands of Richard Bentley in his controversy with the Hon. Charles Boyle, who had published an edition of them in 1695. The first edition of Bentley's *Dissertation on Phalaris* appeared in 1697, and the second edition, replying to the answer which Boyle published in 1698, came out in 1699. From the mention in the letters of towns (Phintia, Alaesa and Tauromenium) which did not exist in the time of Phalaris, from the imitations of authors (Herodotus, Democritus, Euripides, Callimachus) who wrote long after he was dead, from the reference to tragedies, though tragedy was not yet invented in the lifetime of Phalaris from the dialect, which is not Dorian but Attic, nay, New or Late Attic, as well as from absurdities in the matter, and the entire absence of any reference to them by any writer before Stobaeus (*c.* A.D. 500), Bentley sufficiently proved that the letters were written by a sophist or rhetorician (possibly Adrianus of Tyre, died *c.* A.D. 192) hundreds of years after the death of Phalaris. Suïdas admired the letters, which he thought genuine, and in modern times, before their exposure by Bentley, they were thought highly of by some (*e.g.* Sir William Temple in his *Essay on Ancient and Modern Learning*), though others, as Politianus and Erasmus, perceived that they were not by Phalaris. The latest edition of the *Epistles* is by R. Hercher, in *Epistolographi graeci* (1873), and of Bentley's Dissertation by W. Wagner (with introduction and notes, 1883); see especially R. C. Jebb, *Life of Bentley* (1882).

PHALLICISM, or PHALLISM (from Gr. *φαλλός*), an anthropological term applied to that form of nature-worship in which adoration is paid to the generative function symbolized by the phallus, the male organ. It is common among primitive peoples, especially in the East, and has been prominent also among more advanced peoples, *e.g.* the Phoenicians and the Greeks. In its most elementary form it is associated with frankly orgiastic rites. This aspect remains in more advanced forms, but gradually it tends to give place to the joyous recognition of the principle of natural reproduction. In Greece for example, where phallicism was the essence of the Dionysiac worship and a phallic revel was the origin of comedy (see also HERMES), the purely material and the symbolical aspects no doubt existed side by side; the Orphic mysteries had to the intellectual Greeks a significance wholly different from that which they had to the common people. Phallic worship is specially interesting as a form of sympathetic magic: observing the fertilizing effect of sun and rain, the savage sought to promote the growth of vegetation in the spring by means of symbolic sexual indulgence. Such were the rites which shocked Jewish writers in connexion with the worship of Baal and Astārōth (see BAAL; and cf. ATARGATIS, ISHTAR). The same principle is at the root of the widespread nature-worship of Asia Minor, whose chief deity, the Great Mother of the Gods (*q.v.*), is the personification of the earth's fertility: similarly in India worship is paid to divine mothers. Generally it should be observed that phallic worship is not specially or perhaps primarily paid to male deities, though commonly the more important deity is accompanied by a companion of the other sex, or is itself androgynous, the two symbols being found together.

In the Dionysiac rites the emblem was carried at the head of the processions and was immediately followed by a body of men dressed as women (the *ithyphalli*). In Rome the phallus was the most common amulet worn by children to avert the evil eye: the Latin word was *fascinum* (cf. Pliny, *Nat. Hist.* xix. 50, *satyrica signa*; Varro, *Ling. Lat.* vii. 97, ed. Müller). Pollux says that such emblems were placed by smiths before their forges. Before the temple of Aphrodite at Hierapolis (*q.v.*) were two huge phalli (180 ft. high), and other similar objects existed in all parts of the ancient world both in statuary and in painting. Among the Hindus (see HINDUISM) the phallus is called *linga* or *lingam*, with the female counterpart called *yoni*; the *linga* symbolizes the generative power of Siva, and is a charm against sterility. The rites classed together as *Sakti puja* represent the adoration of the female principle. In Mexico, Central America, Peru and other parts of America phallic emblems are found. The tendency, however, to identify all obelisk-like stones and tree-trunks, together with rites like circumcision, as remains of phallic worship, has met with much criticism (*e.g.* Robertson Smith, *Religion of the Semites*, 2nd ed., pp. 456 sqq.).

For authorities see works quoted under RELIGION: §§ A and B *ad fin.*

PHALTAN, a native state of India, in the central division of Bombay, ranking as one of the Satara jagirs. Area, 397 sq. m.; pop. (1901), 45,739, showing a decrease of 31 % in the decade. The estimated revenue is £13,000, and the tribute £640. The chief, whose title is nimbalkar, is a Mahratta, tracing his descent to a grantee from a Delhi emperor in the 14th century. The town of Phaltan is 37 m. north-east of Satara; pop. (1901), 9512.

PHANARIOTES, a name derived from Phanar, the chief Greek quarter at Stamboul, where the occumenical patriarchate is situated, and applied to those members of families resident in the Phanar quarter who between the years 1711 and 1821 were appointed hospodars of the Danubian principalities; that period of Moldo-Wallachian history is also usually termed the Phanariote epoch. It is not to be understood as marking the introduction into the principalities of the Greek element, which had already established itself firmly in both provinces, to both of which Greek princes had been appointed before the 18th century. But whereas the Greek families of earlier introduction gradually became merged in their country of adoption, the later immigrants retained their separate nationality and grew to be powerful agents for furthering the spread of Graecism in the principalities. The person raised to the princely dignity was usually the chief dragoman of the Sublime Porte, and was consequently well versed in contemporary politics and the statecraft of the Ottoman government. The new prince, who was compelled to purchase his elevation with a heavy bribe, proceeded to the country which he was selected to govern, and of the language of which he was in nearly every case totally ignorant, accompanied by a horde of needy hangers-on; he and his acolytes counted on recouping themselves in as short a time as possible for their initial outlay and in laying by a sufficiency to live on after the termination of the prince's brief authority. It was the interest of the Porte to change the princes as often as possible, as the accession donation thus became due more frequently. When, owing to the numerous cases of treachery among the princes, the choice became limited to a few families the plan was hit upon of frequently shifting the prince from one province to the other: the prince of Wallachia, the richer of the two principalities, was always ready to pay a handsome *douceur* to avert his transfer to Yassy; the prince of Moldavia was equally ready to bribe his supporters at Constantinople to secure his appointment to Wallachia. To raise funds to satisfy the rapacity of the Porte the princes became past masters in the art of spoliation, and the inhabitants, liable to every species of tax which the ingenuity of their Greek rulers could devise, were reduced to the last stage of destitution. The active part taken by the Greek princes in the revolt of 1820–21 induced the Porte to revert to the appointment of native princes.

PHANIAS, of Eresus in Lesbos, Greek philosopher, important as an immediate follower of and commentator on Aristotle, came to Athens about 332 B.C., and joined his compatriot, Theophrastus, in the Peripatetic school. He wrote works entitled *Analytica, Categoriae* and *De interpretatione*, which were either paraphrases or critical commentaries, and seem to have added little to Aristotle's own writings. Alexander of Aphrodisias refers to a work πρὸς Διόδωρον, and Athenaeus quotes from another treatise, *Against the Sophists*. Outside philosophy, he and Theophrastus carried on the physical investigations of Aristotle; Athenaeus frequently quotes from a work on botany which manifests great care in definitions and accuracy of observation. From Plutarch (*Life of Themistocles*) we learn that he was regarded as an historian of importance. The chief of his historical works is the *Prytaneis Eresii*, which was either a history of his native place or a general history of Greece arranged according to the period of the Eresian magistracy. He wrote also works on the *Tyrants of Sicily* and on tyranny in general. The value of these books is attested by the frequency with which they are quoted on questions of chronology (*e.g.* by Plutarch, Suïdas, Athenaeus). To the history of Greek literature he contributed works on the poets and on the Socratics, both of which are quoted.

He must be distinguished from another Phanias, a Stoic philosopher, disciple of Posidonius. Diogenes Laërtius mentions a work of his wherein he compares Posidonius with Panaetius in arguing from physical principles.

PHANOCLES, Greek elegiac poet, probably flourished about the time of Alexander the Great. His extant fragments show resemblances in style and language to Philetas, Callimachus and Hermesianax. He was the author of a poem on paederasty. A lengthy fragment in Stobaeus (*Florilegium*, 64) describes the love of Orpheus for the youthful Calaïs, son of Boreas, and his subsequent death at the hands of the Thracian women. It is one of the best extant specimens of Greek elegiac poetry.

See N. Bach, *Philetae, Hermesianactis, et Phanoclis reliquiae* (1829), L. Preller, *Ausgewählte Aufsatze aus dem Gebiete der classischen Alterthumswissenschaft* (1864).

PHANTASMAGORIA, a name invented by a certain Philipstal in 1802 (from Gr. φάντασμα, phantasm, apparition; and ἀγορά, assembly) for a show or exhibition of optical illusions produced by means of the projecting lantern (*q.v.*). The word has since been applied to any rapidly or strikingly changing scene, and especially to a disordered or fantastic scene or picture of the imagination.

PHARAOH (Par'oh), the Hebraized title of the king of Egypt (*q.v.*), in Egyptian Per-'o; Ph ron in Herodotus represents the same. Its combination with the name of the king, as in Pharaoh-Necho, Pharaoh-Hophra, is in accordance with contemporary native usage: the name of the earlier Pharaoh Shishak (Sheshonk) is rightly given without the title. In hieroglyphic a king bears several names preceded by distinctive titles. In the IVth Dynasty there might be four of the latter: (1)  identifying him with the royal god Horus; the name is commonly written in a frame  representing the façade of a building, perhaps a palace or tomb, on which the falcon stands. (2)  connecting him with the vulture and uraeus goddesses, Nekhabi and Buto of the south and north. (3)  a hawk on the symbol of gold, signifying the victorious Horus. (4)  the old titles of the rulers of the separate kingdoms of Upper and Lower Egypt, to be read *stni*, "hutcher(?)," and *byti*, "beekeeper(?)." The personal name of the king followed (4), and was enclosed in a cartouche  apparently symbolizing the circuit of the sun which alone bounded the king's rule. Before the IVth Dynasty the cartouche is seldom found: the usual title is (1), and (3) does not occur. In the Vth Dynasty the custom began of giving the king at his accession a special name connecting him with the sun: this was placed in the cartouche after (4), and a fifth title was added: (5)  Si-rē, "son of the Sun-god," to precede a cartouche containing the personal name. The king was briefly spoken of by his title *stni* (see 4), or *hnm-f*, "his service," or *Ity*, "liege-lord." These titles were preserved in the sacred writing down to the latest age. An old term for the royal palace establishment and estate was Per-'o, "the Great House," and this gradually became the personal designation of Pharaoh (cf. the Grand Porte), displacing all others in the popular language. (F. Ll. G.)

PHARI, a town of Tibet. It is supposed to be the highest and coldest town in the world, being 15,000 ft. above the sea. As it commands the road between the Chumbi Valley and Lhasa and also one of the chief passes into Bhutan, Phari is of considerable military importance, and is defended by a large fort or Jong, which was occupied by the British expedition of 1904. Phari Jong is supposed to have been built about 1500 A.D., and was enlarged or rebuilt in 1792, under Chinese advice, as a defence against the British. It has the appearance of a medieval castle, and seems to have been built in imitation of the European style.

PHARISEES, a sect of the Jews first mentioned by Josephus, in his account (*Ant.* xiii. 5, 9) of the reign of Jonathan, the brother and successor of Judas Maccabaeus. The name, which may be translated "Separatists," indicates their devotion to the ideal, enforced by Ezra and Nehemiah upon the reluctant Jews, of a nation separate from all other nations in virtue of its

peculiar relation to Yahweh (Neh. ix.). This ideal nation consisted of all who were prepared to obey the Law of Moses, irrespective of their natural descent. Consequently the Pharisees, who seem to have been an order of religious teachers, were concerned to make converts (proselytes), and some of their greatest teachers were of non-Jewish parentage. They were also concerned to insist upon the strict observance of the Law, so far as it was compatible with the exigencies of ordinary life, and to train disciples who should set a proper example to the mass of the people.

The ideal of separation descended from the Great Synagogue (Assembly) of the time of Ezra to the Synagogue of the Ḥasidaeans (Assidaeons), who allied themselves with Judas Maccabaeus when his followers decided to suspend the law of the Sabbath, in order that the true Jews might preserve themselves from annihilation and survive to keep the Law as a whole. This action of the Ḥasidaeans is clearly the practical outcome of the principle which Josephus describes in the language of philosophy as the characteristic of the Pharisees—" some things and not all are the work of Fate " (*Ant.* xiii. 5, 9). Fate is the Stoic term for God; and these forerunners of the Pharisees judged that the time had come for them to take action rather than to wait passively on God. But then and always the prime concern of the Pharisees was the extension of God's sovereignty (the Kingdom of God) throughout the world. God's will, which all men should obey, was revealed in the Law, and though He might appoint governors over them, He remained their King, and no governor who was not a prophet—God's mere mouthpiece—could command their unquestioning obedience. When Judas reconquered Jerusalem and re-dedicated the desecrated Temple, his work, from the Pharisees' point of view, was done. The Temple-worship was part and parcel of the Divine plan, and a legitimate High Priest was necessary. Alanius was therefore welcomed by the Ḥasidaeans, and only his treacherous murder of sixty of their number taught them that any Syrian nominee was their enemy. Later they acquiesced in the election of Simon to the high-priesthood with the condition " until there should arise a faithful prophet "; but some of them remonstrated against the combination of the sacred office with the position of political ruler in the person of John Hyrcanus as contrary to the precedent set by Moses at his death. When Alexandra came to the throne the Pharisees were the real rulers and imposed upon the people the deductions from the written Law which formed the growing body of their oral tradition. Their reign was long enough to establish this tradition in respect of ritual, and even when this golden age—as it seemed to later Scribes—was over they exercised a paramount influence upon the common people. They had learned to read God's will in the events of history, and deduced (for example) the doctrine of the resurrection of the dead from the death of the martyrs under Antiochus Epiphanes and Alcimus. And what they learned from current history and from the ancient history of the nation recorded in Scripture they taught in the synagogues, which corresponded not merely to the parish churches but also to the schools—day schools and Sunday schools—of to-day. Apart from their control of public education, their power was enhanced by their efforts to better the position of women, and by their notorious leniency in the matter of punishments. Everything—the repeated statements of Josephus and the facts of Jewish history after A.D. 70—goes to show that the Pharisees moulded the religion of the people. Attempts have been made in modern times to represent the Apocalyptists as opposed to the Pharisees and as occupying the position in popular estimation which Josephus ascribes to the Pharisees. But for such representations there is no solid ground. Superficially the language of apocalypses differs from that of rabbinic decisions, and where the seer takes a comprehensive view of the ages the rabbi legislates for particular cases. But even in the Talmud the reign of Alexandra is described in apocalyptic language such as is commonly applied to the future age, and if allowance be made for the symbolism proper to revelations it is clear that essentially the scribe and the seer have the same purpose and even the same doctrines. The Pharisees were occupied with the piecemeal realization of the dreams of their supposed opponents, which gain a vague glory from their being far off.

The gospels generally have left upon the minds of men an impression unfavourable to the Pharisees. They contain denunciations attributed to our Lord and assigned—with obvious injustice in some cases—to the scribes of this sect. It is to be remembered that the Pharisees were the only sect of the Jews who survived in Christian times and that the Pharisees were never a homogeneous body possessed of a definite policy or body of doctrine. Moreover, it is clear that our Lord denounced not all the Pharisees but the hypocrites only, as did the rabbis whose sayings are reported in the Talmud and other Jewish books. Again, the third gospel in particular betrays relations between the Pharisees and Jesus very different from those of the common Christian view, which conjures up an impossible picture of an absolute breach between the Prophet of Nazareth and the whole corporation of the Pharisees as a result of a quarrel with certain members of that dissident sect of independent thinkers. Gamaliel and his pupil St Paul are better representatives of the non-hypocritical Pharisee; and the Pauline Epistles or the writings of Philo are the best extant examples of the manner and matter of their teaching. As for the denunciations, apart from the charge of insincerity, it appears that the scribes in question are pilloried for the defects—or the excesses—of their qualities. Indeed they are corroborative evidence for the reverence with which the Pharisees were regarded by the people generally, and for the zeal with which they strove to fulfil God's will as contained in the Law and elucidated by the Tradition. (J. H. A. H.)

PHARMACOLOGY. Systematic writers on the subject differ considerably in the exact meaning which they attach to the term pharmacology (φάρμακον, a drug; λόγος, a discourse), some making it much more comprehensive than others. Binz, for instance, defines it as treating of the origin, nature, chemical and physical qualities, physiological actions, and therapeutical uses of drugs; in France and in Italy it is restricted to the mere description of medicines and their preparations, the action and uses of which as remedies are included in the term therapeutics. In English-speaking countries, and by the majority of German writers, the meaning is now restricted to the study of the action of chemical substances (as apart from foods) on all kinds of animals, from bacteria up to man; it is, in fact, a comparative study of the action of chemical bodies on invertebrate and vertebrate animals. One of its practical aims is to obtain a wide and accurate knowledge of remedial substances in relation to their application in the treatment of disease, while another is to discover new or improved remedies. This meaning of the word has now become fixed in the English language by use and wont. The term pharmaco-dynamics (φάρμακον, δύναμις, power), which is etymologically more correct, is often used as its equivalent, but it has never become widely adopted. The study of pharmacological actions was at first almost entirely confined to those of remedial agents, and especially to the remedies in the different national pharmacopoeias, but in many cases it has now been extended to substances which are not used for curative purposes. The introduction into practical use of many medicines, such as paraldehyde, phenazone and strophanthus, has followed the study of their actions on animals, and this tends to be more and more the case. Pharmacology is a branch of biology; it is also closely connected with pathology and bacteriology, for certain drugs produce structural as well as functional changes in the tissues, and in germ diseases the peculiar symptoms are caused by foreign substances (toxins) formed by the infective organisms present in the body. The effects of many of these toxins bear a close resemblance to the action of certain well-known drugs, as in the case of tetanus toxin and strychnine, and are studied by the same methods of observation and research. It is impossible also to dissociate pharmacology from clinical therapeutics; the former investigates the agents which are used in the treatment of disease, the latter is concerned with their remedial powers and the conditions under which they are to be used. Hence the word " pharmaco-therapy " has come into

use, and most of the newer standard textbooks combine together the consideration of pharmacology and therapeutics. Pharmacology is also related to toxicology, as many remedial and other agents are more or less poisonous when given in large doses, but it does not include the detection, tests, and the other strictly medico-legal aspects of poisoning.

History.

Pharmacology proper began as the result of the application of strictly experimental methods to physiology. The discovery (early in the 19th century) that plants owe their remedial and poisonous qualities to small quantities of definite active principles, such as alkaloids and neutral bodies, which can be extracted in a chemically pure condition, had also a very important effect on its development. We meet first with experiments made by investigators who perceived that observations on man and animals might lead to a better understanding of the action of drugs. In 1676 Wepfer and Conrad Brunner demonstrated on dogs the tetanizing action of nux vomica, and similar rough experiments were repeated from time to time with other substances by later investigators. In 1755 Menghini published an elaborate study of the action of camphor on a great variety of different kinds of animals. Albert von Haller (b. 1708) sought to elucidate the action of remedies by observations on healthy men, and in 1767 William Alexander made experiments on himself with drugs, which were, however, brought to an abrupt termination by his nearly killing himself. In 1776 Daries, by observations on himself and on cats, established the mydriatic action of belladonna and other atropaceous plants. Hitherto no attempt had been made to determine what particular parts of the body were especially affected by drugs, but Fontana showed, in his great work (Florence, 1765) on the venom of the viper and on other poisons, that the general symptoms were brought about by an action on particular organs. He performed more than six thousand experiments, more than four thousand of which were on animals, and he determined the effects on the heart and other important structures. These analytical methods of research were well known to the second Monro in Edinburgh, and to his pupils, one of whom, William Alexander, wrote a thesis in 1790 entitled "De partibus corporis animalis quae viribus opii parent." His methods were doubtless known also to the French physiologist Magendie, who improved upon them, and who in 1809 published a research on the Upas Tieuté and other strychnine-containing plants, in which he showed that their effects were due to an action on the spinal cord. The researches of his pupil, Claude Bernard, on curare, were equally exact and logical, and have served as the model for many subsequent investigations. In consequence, from the time of Magendie pharmacology may be said to have been put on a more exact basis. By the middle of the 19th century there were many workers on the subject, and the actions of such drugs as digitalis, morphine, alcohol, and many others had been frequently and minutely investigated. About this time Buchheim, professor of materia medica in Dorpat from 1846 to 1879, founded the first pharmacological laboratory on modern lines in Europe, and he introduced a more rational classification of drugs than had hitherto been in use, arranging them in groups according to their pharmacological actions. In the herbals and older treatises on materia medica and therapeutics no explanation is usually offered of the action of medicines, and in such works as that of Cullen (1789) only a few of the more obvious actions are occasionally explained according to the current theories of physiology and pathology. In works such as Pareira's *Elements of Materia Medica and Therapeutics* (1842), the physiological effects of medicines are usually described, but very briefly as compared with the materia medica. At the present day most textbooks dealing with medicinal agents and treatment devote a large part of their space to pharmacology, and a corresponding change has taken place in the teaching of the subject in universities and medical schools. Since Magendie's time numerous papers dealing with pharmacological subjects have appeared in the *Journal of Anatomy and Physiology*, the *Journal of Physiology*, Virchow's *Archiv*, and the principal medical periodicals of all countries. In 1873 the *Archiv für experimentelle Pathologie und Pharmakologie* first appeared, in 1895 the *Archives Internationales de Pharmakodynamie*, and in 1909 *The Journal of Pharmacology and Therapeutics* (published at Baltimore, U.S.A.), all of which are chiefly or entirely devoted to pharmacology.

The methods of research are essentially those employed by physiologists, the action of substances being studied in the usual way on bacteria, leucocytes, frogs, rabbits and other animals. Not only are the general symptoms investigated, but it is necessary to carry out experiments on the nerves, muscles, circulation, secretions, &c., so as to get a more exact knowledge of the reasons of the general action. It is true that many of these animals react somewhat differently to drugs, both as regards each other and as regards man, but for the most part the differences are quantitative rather than qualitative. After carrying out a series of observations on animals, the drug can be assigned to its special group, and a good idea can be obtained of its possible practical value or the reverse; hence there is a saving of time and an avoidance of the necessity of testing its effects on man.

Action of Drugs.

The action of a drug may be called direct when it acts on any part to which it is immediately applied, or which it may reach through the blood; and indirect when one organ is affected secondarily to another, as, for instance, in strychnine poisoning when the muscles are violently contracted as the result of the action of the alkaloid upon the spinal cord. In a few cases the action is merely physical, but most frequently it is chemical in its nature, and is exerted on the living cell, the activity of which is either stimulated or depressed. In some cases the substances actually enter into a chemical combination with the protoplasm, which may be temporary or (much less frequently) permanent; in other cases they seem simply to modify or disturb the usual chemical activity of the cells. Prolonged or excessive stimulation invariably leads to depression or paralysis, the tissues becoming fatigued, and from this condition they may recover or they may not. When we come to consider more in detail the results of these actions we find that the various secretions of the body, such as the sweat, gastric juice, bile, milk, urine, &c., may be increased or diminished; that the heart may have its muscular or nervous apparatus stimulated or depressed; that the nerve-centres in the brain, medulla and spinal cord may be rendered more sensitive or the reverse; and that the general metabolism of the body may be altered in various ways. In addition, the fluid constituents, such as the lymph and blood, may have their composition and bulk considerably altered, while the special senses, the temperature, and, in short, every function and tissue, may be more or less affected.

Some drugs given in excess are poisons to all forms of protoplasm, but when given in doses much short of the lethal they usually exhibit a distinct tendency to affect specially, and at an early period, certain organs or tissues, and hence result differences in action; others may act only on certain organs, leaving the others practically untouched. It is often possible by appropriate dosage to contrive that these special parts or organs may be affected and the rest of the body left practically intact, and it is by taking advantage of these selective actions that remedial or therapeutical effects are usually obtained. Some substances have a very wide range of action, and involve a great variety of structures, while others, such as purgatives, have a very limited sphere. The action of drugs is often modified by circumstances peculiar to the individuals or animals to whom they are administered. In man the most important of these circumstances is age, but speaking broadly this is really a question of bulk, the child being affected like the adult, but by smaller doses. There are exceptions to this, however, as children are more affected in proportion by opium and some other substances, and less by mercury and arsenic. In old age also the nervous system and the tissues generally do not react so readily as in youth. Habit, race, personal temperament, emotional conditions, disease, the time and circumstances of administration, and other accidental causes may also modify the action in man. Some species of animals are much more susceptible to the action of certain drugs than others, a condition which depends on obvious

or unknown structural or metabolic differences. In the same way some individuals show a special tendency to poisoning by doses of certain drugs which are harmless to the great majority of mankind, and hence we get unexpected or unusual results, these arising from special susceptibility on the part of certain organs. These idiosyncrasies are not confined to drugs, but are seen with a few articles of food, such as eggs and shellfish. It is well known that the habitual consumption of certain drugs, such as tobacco, Indian hemp, opium, arsenic, alcohol and many others, gradually induces a condition of tolerance to their effects, so that large doses can be taken without causing symptoms of poisoning. In all cases, however, there is a limit, and after it is reached the ordinary effects of these substances are seen. Some individuals, however, never become tolerant, and show poisonous effects on each repetition of the dose. The degree of tolerance often differs in individuals at different times and in different circumstances, and may become lost by breaking off the habit for a short time. The explanation generally given is that the nerve and other cells become accustomed to the drug, so that they cease to react, or that an antitoxin is formed which antagonizes the poison, or that the poison is rapidly destroyed in the body. Recent researches on arsenic and atropine, however, point to the leucocytes as playing an important part in the production of tolerance, as these gradually become capable of ingesting large amounts of the foreign substances, and thus render them more or less harmless to the tissues, until they are gradually excreted from the body. When the amount is too large to be dealt with by the leucocytes, poisoning seems to occur even in the most habituated. Tolerance is therefore analogous to, but not identical with, the immunity which takes place with the toxins of infectious diseases and snake poison. Certain substances, notably digitalis, lead, mercury and strychnine, exhibit what is called a cumulative action - that is to say, when small quantities have been taken over a period of time, poisoning or an excessive action suddenly ensues. The explanation in these cases is that the drug is absorbed more rapidly than it is excreted, hence there is a tendency to accumulation in the body until a point is reached when the amount becomes poisonous.

Bodies which have a close resemblance in their chemical constitution exhibit a similar resemblance in their pharmacological action, and as the constitution of the substance becomes modified chemically so does its action pharmacologically. Numerous researches have demonstrated these points with regard to individual groups of substances, but hitherto it has not been possible to formulate any fixed laws regarding the relationship between chemical constitution and physiological action.

When drugs are swallowed no absorption may take place from the alimentary canal; but, as a rule, they pass from there into the blood. Absorption may also take place from the skin, from the rectum, from the respiratory passages, or from wounds, and from direct injection into the subcutaneous tissue or into a blood vessel. Very rarely, as in the case of silver salts, excretion does not take place; but usually the drug is got rid of by the ordinary channels of elimination. Just as drugs act upon the tissues, so they themselves are in many cases reacted upon, and broken up or altered. While in the alimentary canal they are subjected to the action of the digestive fluids and the varied contents of the stomach and intestines, and after absorption they come under the influence of the constituents of the blood and lymph, and of the chemical action of the tissue cells. Inorganic bodies, such as metals, may enter into albuminous combinations which may greatly modify their effects, and organic substances may be split up into simpler compounds by oxidation or reduction, or may be rendered more complex by synthesis.

The antagonism between certain drugs has been much studied in relation to their use as antidotes in poisoning, the aim being to counteract the effects rather than to obtain a direct physiological antagonistic action. Substances which directly antagonize each other by acting on the same tissue are few in number, but there are numerous instances in which the effects or symptoms may be obviated by acting on another tissue. Thus curare may stop strychnine convulsions by paralysing the terminations of motor nerves, and chloroform may exercise the same effect by abolishing the irritability of the spinal cord. If two poisons act on the same tissue, one stimulating and the other paralysing it, the paralysing substance removes the action of the stimulant substance, not by bringing the tissue back to its normal state, but by abolishing its excitability; hence, although life may be saved by such an action, yet it can only be so within certain limits of dosage, because the antagonism is never complete at every point.

Speaking in the widest sense, every substance has an action on living protoplasm, but for convenience pharmacological substances have come to be limited to those which are used as drugs, or which have a distinct action upon the animal organism. Such substances are derived from (1) the chemical elements and their compounds; (2) plants; and (3) animals. The first class includes such substances as iodine, mercury, iron, carbon, and their various compounds, and such bodies as alcohol, chloroform and chloral, all of which are found in nature or can be prepared by ordinary chemical processes of manufacture. From plants many substances are obtained which at the present time we are unable to make in the chemical laboratory, and of the constitution or composition of which we are in many cases ignorant. Some of these, such as resins, gums, essential oils and fats, are readily obtained as natural exudations or by very simple manipulations, while others, such as the alkaloids, glucosides and vegetable acids, often require to be extracted by very complex processes. Substances obtained from animals include gland secretions, pepsin and other ferments, musk, cod-liver oil, &c., and to those may be added various antitoxins. The classification of substances having pharmacological actions presents so many difficulties that no satisfactory or universally adopted method has yet been proposed. Our knowledge presents so many gaps, and the mode of action of many remedies is so obscure and imperfectly understood, that any arrangement adopted must be more or less tentative in character. The close alliance between pharmacology, therapeutics and clinical medicine has induced many authors to treat the subject from a clinical point of view, while its relationships to chemistry and physiology have been utilized to elaborate a chemical and physiological classification respectively as the basis for systematic description. Certain writers in despair have adopted an alphabetical arrangement of the subject, while others have divided it up into inorganic, vegetable and animal substances. These last-mentioned methods are far behind our present state of knowledge, and need not be discussed here. The objection to a strictly chemical classification is, that while many substances closely allied chemically have a somewhat similar action in certain respects, yet in others they differ very widely—a striking example of which is given in the case of sodium and potassium. A physiological classification according to an action on the brain, heart, kidney or other important organ becomes still more bewildering, as many substances produce the same effects by different agencies, as, for instance, the kidneys may be acted upon directly or through the circulation, while the heart may be affected either through its muscular substance or its nervous apparatus. A clinical or therapeutical classification into such divisions as anaesthetics, expectorants, bitters, and so on, according to their practical applications, also leads to difficulties, as many drugs are employed for numerous purposes. The ideal method of grouping pharmacological substances would be in reference to their chemical action on living protoplasm, but as yet our knowledge is too scanty for this. At the present time the method adopted by Buchheim, or some modification of it, is the most scientific. As the result of painstaking investigations he grouped together all those substances having similar actions, giving to each group the name of its best-known or most thoroughly investigated member. Once the groups were more or less fixed any new substance could, when

Classification.

its action was determined, be referred to its own group, and thus be placed or classified. As few substances are absolutely identical in action, but only broadly similar, it is often difficult to divide sharply one group from another. In a *résumé* it is manifestly impossible to pass in review every pharmacological substance, and we shall therefore confine ourselves to those groups which are of practical importance. Many individual drugs are described under their own headings.

GROUP I. *Acids.*—This includes sulphuric, hydrochloric, nitric, phosphoric, tartaric, citric, acetic and lactic acids, all of which owe their action to their acidity. Many of the other acids, such as carbolic and salicylic, have specific effects which have no relationship to their acid reaction. The concentrated acids have an intense local action, varying from complete destruction of the tissues to more or less irritation. When considerably diluted they are only slightly irritating; externally applied and in the stomach they have an antiseptic action; they increase the secretion of saliva, and thus assuage thirst. In the intestine they combine with ammonia and other alkalis present, and are absorbed into the blood as neutral salts, being excreted chiefly in the urine. In small doses they somewhat increase general metabolism. Boric acid only belongs partially to this group, as it and its compound borax have certain specific actions in addition.

GROUP II. *Alkalis.*—This includes caustic potash, caustic soda, solution of ammonia, their carbonates and bicarbonates, borax, soaps, lithium carbonate and citrate, quicklime, slaked lime, chalk, magnesia and magnesium carbonate. All these substances, apart from any other actions, exert a similar effect upon the body in virtue of their alkalinity. When they are taken internally in small amounts they neutralize the acids in the stomach and other parts of the alimentary canal, and at the same time they increase the normal acid secretion of the stomach. After absorption into the blood, which they make somewhat more alkaline, they are excreted chiefly in the urine, to which they impart an alkaline reaction if given in sufficient quantity. Some of them by stimulating the kidney cells act as diuretics, but others apparently lack this action. Caustic potash and caustic soda are locally very irritating, and destroy the tissues, but lose this quality when combined with acids as in the case of their carbonates, bicarbonates and borax. Quicklime is also caustic, but magnesia is bland and unirritating. Weak solutions applied locally saponify fats, soften the epidermis, and thus act as slight stimulants and cleansers of the skin. Calcium salts form insoluble soaps with fats, and combine with albumen in a manner which makes them soothing and astringent rather than irritating. Apart from alkaline effects, these metals differ considerably pharmacologically. Potassium and lithium have a depressing action upon the nervous system, ammonium salts have a stimulating action, while sodium practically speaking is indifferent. Calcium and magnesium have actions somewhat similar to that of potassium. Most of these substances are normal constituents of the body, and indispensable for healthy existence. They are contained in sufficient amount in our ordinary dietary to supply the needs of the organism.

GROUP III. *Easily absorbed Salts.*—Sodium chloride may be taken as the type of those salts which diffuse readily, and are therefore easily absorbed. Sodium nitrate, potassium nitrate, potassium chloride, ammonium chloride, the alkaline iodides and bromides, also belong partly to this group, although most of them have also specific actions. Locally they cause considerable irritation, and when swallowed in concentrated solution may cause vomiting. From the stomach and intestines they are rapidly absorbed, and rapidly excreted from the blood, increasing all secretions and the general metabolism. These effects are apparently due to their irritating action upon individual cells.

GROUP IV. *Salts absorbed with Difficulty.*—This group includes the sulphates of sodium, potassium and magnesium, the acetate and tartrate of potash, citrate of magnesium, sodium phosphate, sodium tartrate and similar salts. Locally their action is slight, but when taken internally, dissolved in water, they are not absorbed from the alimentary canal except in very limited amount. They therefore remain for the most part in the intestine, and as they attract and retain large quantities of water, and at the same time slightly stimulate the mucous membrane, they come to have a purgative action and form the well-known group of saline cathartics. The small portion which is absorbed exerts a diuretic action.

GROUP V. *Heavy Metals.*—These include iron, manganese, aluminium, chromium, zinc, copper, silver, gold, platinum, lead, mercury, and probably antimony, arsenic and bismuth. Although some of these differ very greatly in their actions after absorption, still locally they have certain effects in common due chiefly to their chemical action on albumen. Their soluble salts combine with albumen and preserve it, strong solutions being extremely irritant or caustic, while weaker ones are astringent simply, or even soothing. They are all antiseptics. Their insoluble compounds are much less active locally than the soluble, and in many cases are only effective to the extent to which they are dissolved by the secretions. Some metals are only absorbed from the alimentary canal to such a very limited amount that they exert no general action, while others readily pass into the blood and give rise to more or less marked effects. All of them injected into the blood in large doses act as muscle and nerve poisons, and during their excretion by the kidney usually irritate it severely, but only a few are absorbed in sufficient amount to produce similar effects when given by the mouth. When iron is injected directly into a vein it depresses the heart's action, the blood pressure and the nervous system, and during its excretion greatly irritates the bowel and the kidneys. When taken by the mouth, however, no such actions are seen, owing to the fact that very minute quantities are absorbed, and that these become stored in the liver, where they are converted into organic compounds and ultimately go to form haemoglobin. Soluble salts of manganese, aluminium, zinc, copper, gold, platinum and bismuth have, when given by the mouth, little action beyond their local astringent or irritating effects; but when injected into a blood-vessel they all exert much the same depressing effect upon the heart and nervous system. Silver resembles them closely, but differs by the circumstance that it is deposited permanently in minute granules in the tissues, and, without affecting the general health, stains the skin of a bluish colour (argyria). Mercury and lead are absorbed from the bowel in considerable quantities, and are capable of inducing acute irritant poisoning as well as chronic poisoning. Lead poisons the muscular and nervous systems, and gives rise to paralysis, wasting, colic and other symptoms, while in the case of mercury, tremors, salivation, anaemia and very marked cachexia are induced. Arsenic and antimony do not form combinations with albumen, but they both greatly depress the central nervous system and circulation; and, if their action be long continued in large doses, they cause fatty degeneration of the viscera and disappearance of glycogen from the liver. Locally they are both very irritating, and antimony has a special tendency to cause vomiting.

GROUP VI. *Halogens.*—This group includes iodine, bromine and chlorine, in their free state or as compounds. Locally they are all three strongly irritant or caustic, owing to their chemical action on albumen. They are in addition powerful germicides, and by splitting up water may act as oxidizing agents. Owing to their strong affinity for the hydrogen of organic compounds they often act as bleachers and deodorizers. Iodine has a special interest, as it is a necessary constituent of food, and is present in the secretion of the thyroid gland. Apart from certain conditions of ill health, the iodides, as such, have no very marked influence on the healthy body beyond their saline action. Alkaline bromides, in addition to their saline action, have in sufficient doses a depressing effect upon the central nervous system, and less markedly upon the heart. Chlorine compounds are not known to exercise any action of a similar kind.

GROUP VII. *Sulphur.*—Sulphur itself has no action, but when brought into contact with the secretions it forms sulphides, sulphites and sulphuretted hydrogen, and thereby becomes more or less irritant and antiseptic. In the bowel its conversion into sulphides causes it to act as a mild laxative. Baths containing sulphuretted hydrogen or alkaline sulphides have a slightly irritating effect upon the skin, and stimulate the general metabolism.

GROUP VIII. *Phosphorus.*—This includes phosphides, and, according to some authorities, hypophosphites. Phosphorus is present in all cells, in considerable quantity in the nervous tissue, and in the bones as phosphates. It is therefore, in some form or other, a necessary part of dietary. When taken by the mouth phosphorus is an irritant poison in large doses; in small doses the only effects noticeable consist in an increased formation of bony and connective tissue, although it is also supposed to exert a gently stimulating effect upon the nervous system.

GROUP IX. *Oxygen.*—When pure oxygen is inhaled the only effect is a slight increase of the amount of the gas in the blood, but this has no particular physiological effect. The pharmacological action of hydrogen peroxide (H_2O_2), potassium permanganate, powdered charcoal and some other oxidizing agents depends on the readiness with which they give up oxygen.

GROUP X. *Carbonic Acid.*—Carbonic acid gas, carbonic oxide (CO) and some other irrespirable gases produce their effects practically by asphyxiation. When dissolved in water, however, carbonic acid gas is a gentle stimulant to the mouth, stomach and bowel, the mixture being absorbed more rapidly than plain water; hence its greater value in assuaging thirst. Nitrous oxide (laughing gas) was at one time believed to act simply by cutting off the supply of oxygen to the tissues, but it also has a specific effect in producing paralysis of certain parts of the central nervous system, and hence its value as an anaesthetic; when given in small amounts mixed with air it produces a condition of exhilaration.

GROUP XI. *Water.*—Water acts directly as a diluent and solvent. It therefore increases all the secretions, especially those of the skin and kidneys, while it also stimulates the general metabolism of the body and the excretion of nitrogenous products. Mineral waters act in the same way, but their effects are very much modified by, and depend largely upon, other constituents, such as alkaline salts, iron, arsenic, sulphides, carbonic acid, &c.

GROUP XII. *Tannic Acid.*—Tannic acid is present in small quantities in the great majority of plants, but in notable quantity in gall-nuts, oak bark, bearberry leaves, rhatany root, catechu, kino,

red gum, bael fruit, logwood and witch hazel, all of which are largely used as medicines. In these the variety of tannic acid is not exactly the same, but although there are slight chemical differences, they all possess the power of tanning raw hides and of preserving albuminous tissues. The action of tannic acid is strictly local, and depends upon its power of precipitating albumen and of destroying germs. It thus acts as an astringent on all mucous membranes. After absorption into the blood it loses this effect, as it is partly broken up into gallic acid and partly combined with alkalis, both of which changes nullify its action upon albumen.

GROUP XIII. *Local Irritants.*—Although some of the drugs already considered have a local irritant action, they produce other more important effects, but the substances here ranged under this heading depend entirely for their action on their local irritant effects.

a. Those which act upon the alimentary canal: Simple bitters such as quassia wood, calumba root, taraxacum, gentian, chiretta, and many others, irritate gently the mucous membrane of the stomach and bowels, and by increasing the secretions improve the appetite and digestion. The aromatic bitters such as chamomile flowers, cascarilla bark, hops, orange peel and others contain in addition small quantities of essential oils which increase their local action. The active principles in some of these bitters have been isolated pure, and have been found to be alkaloids or neutral compounds. Substances like pepper, cayenne pepper, mustard, horse-radish and ginger irritate the stomach and bowel much in the same way, but are more pungent, and are consequently used as condiments. Some of these have a similar but less marked effect upon the skin. The large number of vegetable substances used as purgatives owe their action to an irritating effect upon the mucous membrane and the neuro-muscular apparatus of the bowel, whereby the secretions and peristalsis are more or less increased, as the result of which diarrhoea ensues. Some of them cause so much irritation that the discharge is very watery (hydragogue cathartics), while others, for example aloes, by acting gently on the lower part of the bowel and on its muscular coat, produce simply a laxative effect. A few of them, such as aloin and colocynthin, are also purgative when injected subcutaneously or into the blood, probably owing to their being excreted into the intestinal canal.

b. Those which act on the skin: The best known of these is cantharides (Spanish fly), the active principle of which is a colourless crystalline body—cantharidin—which is extremely irritating. On a mucous membrane or a delicate skin it exerts an irritant action, which occurs more quickly than on a thickened epidermis, such as the scalp, and according to the strength and period of application there may result redness, a blister, or an ulcer. Many other substances, such as chrysarobin, mustard, pepper, &c., are also capable of irritating the skin, the effect produced varying from mere dilatation of the cutaneous vessels to destruction of tissue.

GROUP XIV. *Male-fern.*—This includes the male-fern, santonin, cusso, pomegranate bark, pumpkin seeds and many other substances containing active principles which have a specific poisonous action on intestinal parasitic worms. Apart from this their actions vary considerably, but are of little practical importance.

GROUP XV. *Ethereal Oils.*—This includes a very large number of substances which owe their action to the fact that they contain ethereal or essential oils. The best known of these are cloves, pimento (allspice), myrtle, eucalyptus, caraway, fennel, dill, coriander, rosemary, lavender, peppermint, spearmint, nutmeg, cinnamon, sandalwood, turpentine, juniper berries, valerian and sumbul. In this group may be included the oleo-resins, such as copaiba, cubebs and Canada balsam; the gum-resins, such as asafetida, myrrh, ammoniacum and galbanum; and the true balsams, such as benzoin, storax, balsam of Tolu and balsam of Peru. The resins when taken internally have much the same action as essential oils, which are closely allied chemically, while the benzoic and cinnamic acids in the balsams modify their actions very slightly. Although individual essential oils may differ somewhat in action, chemically and pharmacologically they are fundamentally similar. They all have a poisonous action on protoplasm, which makes them useful in medicine as antiseptics, disinfectants, germicides, anti-fermentatives and parasiticides; when locally applied they are more or less irritating, and, when very dilute, astringent. When swallowed in small doses they slightly irritate the mouth and gastric mucous membrane, increasing the secretions and producing a feeling of warmth. At the same time they increase the movements of the stomach, and also in this way hasten digestion, an action which extends to the upper part of the bowel. They are readily absorbed into the blood, and they are excreted chiefly by the kidneys in a more or less altered form, and probably also by the different mucous membranes, and even by the skin. After absorption their action, speaking generally, is exerted on the brain and spinal cord, and is at first slightly stimulant and afterwards depressing, even to the causing of sleepiness and stupor. Locally applied they depress the terminations of sensory nerves, and may thereby lessen pain. On the heart and circulation the effects are stimulant unless large doses are given, when the pulse becomes slow and blood-pressure much lessened. During excretion they irritate the kidneys and the sweat-glands, and thereby increase the excretion of urine and of sweat. They also increase the number of leucocytes in the blood, and the more irritating of them increase the flow of blood to the pelvic organs, and may thus stimulate the uterus, or in large doses cause abortion. The various camphors, such as laurel camphor, Borneo camphor, menthol and cumarin, are oxidized derivatives of essential oils, and differ only superficially from them in their action.

GROUP XVI. *Phenol.*—This includes a very large number of bodies chemically allied to benzol, such as carbolic acid, sulphocarbolates, creosote, wood tar, coal tar, oil of cade, thymol, salicylic acid, benzoic acid, naphthol, hydroquinon, cresol, guaiacol, ichthyol, saccharin and many others. These all resemble carbolic acid more or less closely, and may be described as general protoplasm poisons. Locally their destructive and irritating effects vary a good deal, but even when very dilute they all have a marked poisonous action on bacteria, white blood corpuscles, yeast and similar organisms. After absorption most of them exercise a depressing effect upon the nervous system, and are capable of reducing high temperature. They are mostly excreted in the urine.

GROUP XVII. *Alcohol.*—This group also includes a very large number of chemical bodies, only a few of which are mentioned here. Ethyl alcohol is taken as a type of the action of methyl alcohol, amyl alcohol, propyl alcohol, ether, acetic ether, paraldehyde, sulphonal, chloroform, methyl chloride, ethyl chloride, chloral hydrate, butylchloral hydrate, and almost any number of derivatives from these. Some of them are so volatile that they produce their effects when inhaled, others when sprayed upon the skin cause intense cold and then anaesthesia; but taken in the broadest sense the action of all of them after absorption into the blood is very similar, and is exerted upon the central nervous system, more especially the cerebrum. In all cases there is a longer or shorter period of excitement, followed by intoxication or narcosis, and with large doses this passes into paralysis and death from depression of the respiratory centre or of the heart. Small doses of any of them dilate the blood vessels from an action on the vaso-motor centre in the medulla oblongata, as a result of which the heart beats more rapidly and the blood circulates more freely; but larger doses have a general depressing effect upon the circulatory system. Under their action more heat is lost from the body, the general metabolism is diminished and the temperature falls. With some of them, such as chloral and chloroform, the stimulation period is short compared with the narcotic period, while with others, such as ether, the reverse is the case.

GROUP XVIII. *Nitrites.*—This group contains amyl nitrite, ethyl nitrite, methyl nitrite, nitroglycerin, sodium and potassium nitrites, erythrol-tetranitrate, and many other compounds containing nitrous or nitric acid. The latter becomes reduced to nitrous in the body, and thereby exercises its characteristic effects. These consist chiefly in an action upon non-striped muscle, vaso-motor centres, blood vessels and the blood. When they are given by inhalation or by the mouth their first effect is to produce marked dilatation of the small arteries, with a fall of blood-pressure and a greatly increased rapidity of the heart's action. At the same time the non-striped muscles slightly lose their tonicity, and when very large doses are given the haemoglobin of the blood becomes converted into the chocolate-coloured methaemoglobin. The volatile members of the group act much more rapidly and more transiently than the others.

GROUP XIX. *Alkaloids.*—This embraces a very large number of important pharmacological substances, which differ a good deal in the details of their action, but they all act upon muscle and nerve tissue. Some of them affect only certain portions of the nervous system, others have a much wider range of action; they may act in either case as stimulants or as depressants, and hence the symptoms produced by them vary very greatly.

1. Morphine and the other opium alkaloids (codeine, narcotine, laudanine, &c.) have two prominent actions—a narcotic followed by a tetanic action. In morphine, on the higher animals at least, the narcotic action is very marked, the tetanizing action slightly so; while in thebaine there is little narcotic effect, but a tetanizing action like that of strychnine. Morphine exercises its effects chiefly upon the cerebrum and the medulla oblongata in man. It has in addition a markedly depressing action upon the respiratory centre. It lessens all the secretions except the sweat, and diminishes bowel peristalsis and the size of the pupil. Men are much more affected by it than birds, rabbits, dogs and most other animals. Cats, however, show marked symptoms of cerebral excitement and increase of the reflexes. Compared with morphine, codeine and the other alkaloids are only slightly narcotizing.

2. Strychnine and brucine very closely resemble each other in action, and under this heading curarine may also be included. These bodies stimulate the grey matter in the spinal cord and cause tetanic convulsions. In the case of curare these are masked almost at once by paralysis of the terminations of the motor nerves.

3. Caffeine is the active principle in tea, coffee, kola, maté and guarana; while theobromine, a body closely allied to it, is found in cocoa and chocolate. They both stimulate the grey nerve-cells in the brain and cord, this being the foundation of their dietetic value and their use as nervine stimulants. They also markedly increase the secretion of urine by stimulating the secreting cells of the kidneys.

4. Cocaine is the active principle of the coca leaf, which is chewed

as a stimulant-narcotic in Peru and Bolivia. Small doses excite the nervous system, while larger doses are depressing. The chief action of cocaine from a practical point of view is its power of paralysing the terminations of sensory nerves.

5. Atropine, hyoscyamine, homatropine, duboisine, daturine and some other bodies have a paralysing action upon the ends of the motor and secretory nerves. They therefore lessen all the secretions, and among other actions dilate the pupil and increase the rapidity of the heart by paralysing the vagus. In addition they have a stimulating action on the central nervous system.

6. Nicotine, piturine and lobeline are the active principles of tobacco and other substances which are smoked as stimulant narcotics. In large doses they are powerful nerve poisons, but as usually taken they exercise a gently stimulant effect upon the nervous system. Pilocarpine has an action closely allied to that of nicotine, but as it is much less poisonous (the effects produced by small doses being chiefly excessive sweating and salivation), it is capable of being utilized in medicine. Muscarine has a very close resemblance in action to pilocarpine.

7. Physostigmine, the active principle of the Calabar bean, acts chiefly as a stimulant to voluntary and involuntary muscles, and at the same time exercises a depressing effect upon the spinal cord. It contracts the pupil.

8. Conine, gelseminine and sparteine all exert a paralysing effect on the terminations of the motor nerves, to the implication of which the weakened gait and other symptoms are due.

9. Aconitine, delphinine and many of their derivatives have a very widespread depressing action on muscle and nerve.

10. Apomorphine is essentially a muscle poison, but owing to the fact that minute doses stimulate the vomiting centre and cause emesis before any other symptoms are observable, its emetic action is the most prominent effect in man.

11. Emetine acts as a gradual depressant to the nervous system in animals. In man its chief effect is its emetic action, which seems to be due entirely to local irritation of the stomach.

12. Quinine. Several of the other alkaloids found in cinchona bark act very much like quinine. They all depress the conducting power and the grey matter of the spinal cord, and to a much less extent that of the brain. They lessen the general metabolism and lower febrile temperature. The cinchona alkaloids have a specifically poisonous effect on the parasites of malaria when present in human blood, and are poisonous to all low organisms.

13. Phenacetin, acetanilide, phenazone and many similar bodies act as antipyretics in virtue of an action on the heat-regulating centres in the cerebrum.

Group XX. *Digitalis.*—This group-name has been given to a large number of substances which have an action similar to that of the foxglove leaves, including the active principles of strophanthus, squill, *Urechites suberecta*, *Convallaria majalis*, *Nerium Oleander*, *Helleborus niger*, *Antiaris toxicaria* (the upas tree), and several others. The active principles of these vary a good deal in chemical composition, but they are all non-nitrogenous neutral bodies. Their action is exerted upon muscle, and chiefly upon the muscle of the heart and blood-vessels. The individual muscle-fibres contract and expand more perfectly, and thus the diastole and systole of the heart are rendered more complete, the pulse is slowed, and the blood-pressure is raised. The slowing of the heart is partly brought about by an action on the vagus centre.

Group XXI. *Picrotoxin.*—In large doses the action of picrotoxin is exerted chiefly on the medullary nerve centres, whereby irregular tonic-clonic convulsions are produced; in minute doses it stops the secretion of sweat.

Group XXII. *Saponin.*—Saponin and many allied bodies form an abundant soapy-looking froth when shaken up with water, and they are contained in a very large number of plants, the chief of which are the *Quillaia saponaria*, *Polygala senega*, sarsaparilla, and others, known collectively as soapworts. They all act as local irritants in the alimentary canal, and after absorption are more or less depressing to the muscular and nervous systems. They produce slight nausea and increased secretion of mucus.

Group XXIII. *Cyanogen.*—This includes compounds of cyanogen such as hydrocyanic (prussic) acid, cyanides of potassium, sodium, &c., cherry-laurel water, amygdalin, bitter almonds and other chemical and vegetable substances which readily yield hydrocyanic acid. Hydrocyanic acid is a general protoplasmic poison, all the lower organisms being very susceptible to its action, while in the higher animals it speedily depresses or paralyses all forms of nerve tissue. It enters into combination with haemoglobin, forming a bright scarlet compound and interfering with respiration. It kills by its paralysing effect on the motor ganglia of the heart and on the respiratory centre.

Group XXIV. *Ferments.*—These include such bodies as pepsin, diastase, the pancreatic ferments, papain, the pine-apple ferment, taka-diastase and others, and serve to convert starch into saccharine substances, or albumen into peptone and albumoses.

Group XXV. *Animal Glands and Secretions.*—Of these the thyroid gland, the suprarenal bodies, the spleen, the bile, the bone marrow, the ovaries and some others have been investigated fully. Speaking generally, when given in small doses their action on the healthy organism is slight or nil, but in disease some of them are capable of acting as substitutes for deficient secretions.

Group XXVI. *Antitoxins.*—These are substances which antagonize the toxins formed in the body by pathogenic organisms, the toxins of snake venom and other animal poisons, and vegetable toxins such as abrin, ricin, &c. A healthy person can be rendered insusceptible by gradually accustoming him to increasing doses of these poisons, and this immunity is due to antitoxins which are found in the blood-serum and which are products of the blood cells. The nature of these antitoxic substances is not definitely known, but they combine with and destroy the poisons. In specific germ diseases a similar antitoxin forms, and in cases which recover it counteracts the toxin, while the germs are destroyed by the tissues. Antitoxins can be prepared by immunizing a large animal, such as a horse, by injecting gradually increasing doses of specific toxins into its subcutaneous tissue. In due time the horse is bled, the serum is filtered free of blood corpuscles, and then constitutes the antitoxic serum, which can be standardized to a certain potency. Such serums are injected subcutaneously in diphtheria, tetanus, streptococcic infections, plague, snake-poisoning, cholera and other similar diseases. They do not as a rule harm healthy men even in large quantities, but when repeated they often cause serious symptoms due to the body becoming more sensitive to the action of the horse-serum in which they are contained.

Group XXVII. *Neutral Fats.*—This includes cod-liver oil, almond oil, olive oil, lard, &c., all of which act as foods when taken internally, and have a merely physical emollient action when applied externally. Lanolin, linseed oil, wax, spermaceti, &c., also belong to this group. The paraffins, glycerin and vaseline, although not fats, have much the same effect when applied externally, but they are not nutritive.

Group XXVIII. *Sugars, Starches, Gums, Gelatin, &c.*—Although these and allied bodies are used in various ways as remedies, their action is for the most part purely mechanical or dietetic.

Terminology in Therapeutics.

It may be useful to give here a general explanation of the common names used in the therapeutic classification of drugs. It is convenient to divide drugs and other substances used in medicine into groups according to the part of the system on which they chiefly act, though, as stated above, many drugs act in more than one manner and could come under several groups.

I. Drugs acting on the blood-vessels, which either dilate the vessels when taken internally or applied locally, or contract the superficial arterioles. *Irritants* (Lat. *irritare*, to excite) include: *Rubefacients* (Lat. *rubefacere*, to make red), which cause the skin to become red from dilatation of the blood-vessels; *Vesicants* (Lat. *vesica*, a bladder), which irritate sufficiently to cause the blood-serum to exude and form vesicles or blisters, *e.g.* cantharides; *Pustulants* (Lat. *pustula*, a blister), still more powerful in their effects, causing the blisters to become filled with pus, *e.g.* croton oil. *Escharotics* (Gr. ἐσχάρα, hearth, brazier; hence mark of a burn, "scar") or *Caustics* (Gr. καίειν, to burn), cause the death of the part, *e.g.* silver nitrate and nitric acid. The term *counter-irritant* is used when an irritant is applied to the skin for the purpose of relieving pain or congestion by dilating the superficial vessels. Drugs which contract the vessels and diminish exudation comprise *Astringents* (Lat. *astringere*, to draw close), while *Styptics* (στύφειν, to contract) or *Haemostatics* (Gr. αἷμα, blood, στατικός, causing to stand) are substances applied either locally or internally in order to arrest bleeding; cold, adrenalin, ergot and the per-salts of iron may be taken as examples.

II. Drugs acting on the digestive tract. *Sialogogues* (Gr. σίαλον, spittle, ἀγωγός, leading) increase the flow of saliva, *e.g.* mercury; *Antisialogogues* decrease the flow, *e.g.* belladonna. *Aromatics* (Gr. ἄρωμα, spice) or *Bitters* increase the flow of the gastric juice. *Stomachics* (Gr. στόμαχος) have the same effect. The term *Carminatives* (Lat. *carminare*, to card wool), adopted from the old medical theory of humours, is generally applied to pungent substances which help to expel gas from the stomach by stimulating the movement

of its contents. *Emetics* (Gr. ἔμετος, vomiting) are substances given for the purpose of causing vomiting, *e.g.* ipecacuanha or apomorphine. *Anti-emetics* or *Sedatives* (Lat. *sedare*, to compose) arrest vomiting either by their central or local action, *e.g.* opium, cocaine or cerium oxalate. *Purgatives* (Lat. *purgare*, to cleanse) aid the onward passage of the contents of the intestinal canal, either by increasing the contractions of its muscular coat as *laxatives* (Lat. *laxare*, to loosen), *e.g.* as magnesia, or by increasing the flow of fluid. Some are termed *drastics* (Gr. δραστικός, active) or *cathartics* (Gr. καθαρτικός, cleansing), which produce watery evacuations. *Cholagogues* (Gr. χολή, bile, ἀγωγός, leading) are purgatives which act by increasing the flow of bile, either by causing an increased secretion (*e.g.* podophyllum) or by sweeping it onwards by stimulating the intestinal contractions (*e.g.* calomel).

III. Drugs acting on parasites. *Anthelmintics* (Gr. ἀντί, against, ἕλμινς, ἕλμινθος, a worm) are drugs which kill parasites inhabiting the intestine. The term *vermicide* (Lat. *vermis*, worm, *caedere*, to kill) is applied to drugs which directly kill the entozoa, while *vermifuge* (Lat. *vermis*, worm, *fugare*, to put to flight) is applied to the purgative usually given after the vermicide for the purpose of expelling the worm. *Parasiticides* or *anti-parasitics* destroy parasites; the terms are usually restricted to those acting on skin-parasites as contrasted with intestinal ones.

IV. Drugs acting on the urinary system. *Diuretics* (Gr. διά, through, οὖρον, the urine) increase the flow of urine, while *lithontriptics* (Gr. λίθος, stone, τρίβειν, to rub, grind down) are drugs given to prevent the formation of urinary calculi.

V. Drugs acting on the generative system. *Aphrodisiacs* (Gr. Ἀφροδίτη, the goddess of love) increase the action of the generative centre in the spinal cord; *Anaphrodisiacs* decrease its action. *Ecbolics* (Gr. ἐκβάλλειν, to throw out) or *oxytocics* (Gr. ὀξύς, sharp, quick, τόκος, parturition) stimulate uterine action. *Emmenagogues* (Gr. ἔμμηνα, menses, ἀγωγός, leading) are substances which increase the menstrual flow. *Galactogogues* (Gr. γάλα, milk) increase the secretion of milk, while *antigalactogogues* (*e.g.* belladonna) have the opposite effect.

VI. Drugs acting on the respiratory system. *Expectorants* increase the bronchial secretions; *antispasmodics* relax the spasm of the muscular coat of the bronchial tubes, *e.g.* stramonium. This latter term is also used for drugs which act as general depressants

VII. Drugs or substances acting on the bodily heat. *Antipyretics* (Gr. ἀντί, against, πυρετός, fever) either increase the heat loss or diminish its production; *e.g.* phenacetin, cold water, &c.

VIII. Drugs or substances acting on the skin. *Diaphoretics* (Gr. διαφορεῖν, to carry through) increase the amount of sweat, either by acting directly on the sweat centres or on the nerve terminals. The word *Sudorific* (Lat. *sudor*, sweat) is applied to them when they act very powerfully. *Anhidrotics* or *Antihidrotics* (Gr. ἱδρώς, sweat) diminish the secretion of sweat. *Emollients* (Lat. *mollis*, soft) are substances which soften and protect the parts. Demulcents (Lat. *demulcere*, soften), soothe the skin or mucous membrane.

IX. Drugs acting on metabolism. *Alteratives* are drugs which alter the course of a disease, the mode of action being unknown. *Tonics* are drugs which increase the muscular tone of the body by acting either on the stomach, heart, spinal cord, &c.

X. Drugs acting on the blood. *Antitoxins* are organic products designed to neutralize the formation of the toxins of certain diseases in the blood. *Toxins* are also injected in order to stimulate the blood plasma to form antitoxins (see BACTERIOLOGY). *Antiperiodics* inhibit a disease having periodic recurrences; *e.g.* quinine in malaria. *Haematinics* are drugs which increase the amount of haemoglobin in the blood.

XI. Drugs acting on the nervous system. *Anaesthetics* (*q.v.*) diminish sensibility, either central or peripheral; *Anodynes* (Gr. ἀν-, priv., ὀδύνη, pain) relieve pain only, but, as in *Analgesics* (Gr. ἄλγησις, sense of pain), sensibility is unaltered. *Stimulants* are those which lead to excitation of the mental faculties and in quantity may lead to delirium and incoherence. *Hypnotics* (Gr. ὕπνος, sleep) or *Soporifics* (Lat. *sopor*, a deep sleep) are drugs which produce sleep without causing cerebral excitement. *Narcotics* (Gr. νάρκη, numbness) are those which besides producing sleep may in large doses depress the functions of respiration and circulation.

XII. Drugs which arrest the progress of putrefaction. This is either by inhibiting the growth of micro-organisms (*Antiseptics*) or by destroying them when present (*Disinfectants*). (H. L. H.)

PHARMACOPOEIA (lit. the art of the φαρμακοποιός, or drug-compounder), in its modern technical sense, a book containing directions for the identification of simples and the preparation of compound medicines, and published by the authority of a government or of a medical or pharmaceutical society. The name has also been applied to similar compendiums issued by private individuals. The first work of the kind published under government authority appears to have been that of Nuremberg in 1542; a passing student named Valerius Cordus showed a collection of medical receipts, which he had selected from the writings of the most eminent medical authorities, to the physicians of the town, who urged him to print it for the benefit of the apothecaries, and obtained for his work the sanction of the senatus. An earlier work, known as the *Antidotarium florentinum*, had been published under the authority of the college of medicine of Florence. The term "pharmacopoeia" first appears as a distinct title in a work published at Basel in 1561 by Dr A. Foes, but does not appear to have come into general use until the beginning of the 17th century. Before 1542 the works principally used by apothecaries were the treatises on simples by Avicenna and Serapion; the *De synonymis* and *Quid pro quo* of Simon Januensis; the *Liber servitoris* of Bulchasim ben Aberazerim, which described the preparations made from plants, animals and minerals, and was the type of the chemical portion of modern pharmacopoeias; and the *Antidotarium* of Nicolaus de Salerno, containing Galenical compounds arranged alphabetically. Of this last work there were two editions in use—Nicolaus magnus and Nicolaus parvus; in the latter several of the compounds described in the larger edition were omitted and the formulae given on a smaller scale.

Until 1617 such drugs and medicines as were in common use were sold in England by the apothecaries and grocers. In that year the apothecaries obtained a separate charter, and it was enacted that no grocer should keep an apothecary's shop. The preparation of physicians' prescriptions was thus confined to the apothecaries, upon whom pressure was brought to bear to make them dispense accurately, by the issue of a pharmacopoeia in May 1618 by the College of Physicians, and by the power which the wardens of the apothecaries received in common with the censors of the College of Physicians of examining the shops of apothecaries within 7 m. of London and destroying all the compounds which they found unfaithfully prepared. This, the first authorized *London Pharmacopoeia*, was selected chiefly from the works of Mezue and Nicolaus de Salerno, but it was found to be so full of errors that the whole edition was cancelled, and a fresh edition was published in the following December. At this period the compounds employed in medicine were often heterogeneous mixtures, some of which contained from 20 to 70, or more, ingredients, while a large number of simples were used in consequence of the same substance being supposed to possess different qualities according to the source from which it was derived. Thus crabs' eyes, pearls, oyster-shells and coral were supposed to have different properties. Among other ingredients entering into some of these formulae were the excrements of human beings, dogs, mice, geese and other animals, calculi, human skull and moss growing on it, blind puppies, earthworms, &c. Although other editions of the *London Pharmacopoeia* were issued in 1621, 1632, 1639 and 1677, it was not until the edition of 1721, published under the auspices of Sir Hans Sloane, that any important alterations were made. In this issue many of the ridiculous remedies previously in use were omitted, although a good number were still retained, such as dogs' excrement, earthworms, and moss from the human skull; the botanical names of herbal remedies were for the first time added to the official ones; the simple distilled waters were ordered of a uniform strength; sweetened spirits, cordials and ratifias were omitted as well as several compounds no longer used in London, although still in vogue elsewhere. A great improvement was effected in the edition published in 1746, in which only those preparations were retained which had received the approval of the majority of the pharmacopoeia committee; to these was added a list of those drugs only which were supposed to be the most efficacious. An attempt was made to simplify further the older formulae by the rejection of superfluous ingredients. In the edition published in 1788 the tendency to simplify was carried out to a much greater extent, and the extremely compound medicines which had formed the principal remedies of physicians for 2000 years were discarded, while a few powerful drugs which had been considered too dangerous to be included in the *Pharmacopoeia* of 1765 were restored to their previous position. In 1809 the French chemical nomenclature

was adopted, and in 1815 a corrected impression of the same was issued. Subsequent editions were published in 1824, 1836 and 1851.

The first *Edinburgh Pharmacopoeia* was published in 1699 and the last in 1841; the first *Dublin Pharmacopoeia* in 1807 and the last in 1850.

The preparations contained in these three pharmacopoeias were not all uniform in strength, a source of much inconvenience and danger to the public, when powerful preparations such as dilute hydrocyanic acid were ordered in the one country and dispensed according to the national pharmacopoeia in another. In consequence of this inconvenience the Medical Act of 1858 ordained that the General Medical Council should cause to be published a book containing a list of medicines and compounds, to be called the *British Pharmacopoeia*, which should be a substitute throughout Great Britain and Ireland for the separate pharmacopoeias. Hitherto these had been published in Latin. The first *British Pharmacopoeia* was published in the English language in 1864, but gave such general dissatisfaction both to the medical profession and to chemists and druggists that the General Medical Council brought out a new and amended edition in 1867. This dissatisfaction was probably owing partly to the fact that the majority of the compilers of the work were not engaged in the practice of pharmacy, and therefore competent rather to decide upon the kind of preparations required than upon the method of their manufacture. The necessity for this element in the construction of a pharmacopoeia is now fully recognized in other countries, in most of which pharmaceutical chemists are represented on the committee for the preparation of the legally recognized manuals.

National pharmacopoeias now exist in the following countries: Austria, Belgium, Chile, Denmark, France, Germany, Great Britain, Greece, Holland, Hungary, India, Japan, Mexico, Norway, Portugal, Russia, Spain, Sweden, Italy, Switzerland, the United States of America and Venezuela. All the above-mentioned were issued under the authority of government, and their instructions have the force of law in their respective countries, except that of the United States, which was prepared by commissioners appointed by medical and pharmaceutical societies, and has no other authority, although generally accepted as the national textbook.

The French *Codex* has probably a more extended use than any other pharmacopoeia outside its own country, being, in connexion with Dorvault's *L'Officine*, the standard for druggists in a large portion of Central and South America; it is also official in Turkey. The sum-total of the drugs and preparations it contains is about 1250, or double the average of other modern pharmacopoeias. The progress of medical knowledge has led to a gradual but very perceptible alteration in the contents of the pharmacopoeias. The original very complex formulae have been simplified until only the most active ingredients have been retained, and in many cases the active principles have to a large extent replaced the crude drugs from which they were derived. From time to time such secret remedies of druggists or physicians as have met with popular or professional approval have been represented by simpler official preparations.

The rapid increase in medical and pharmaceutical knowledge renders necessary frequent new editions of the national pharmacopoeias, the office of which is to furnish definite formulae for preparations that have already come into extensive use in medical practice, so as to ensure uniformity of strength, and to give the characters and tests by which their purity and potency may be determined. But each new edition requires several years to carry out numerous experiments for devising suitable formulae, so that the current Pharmacopoeia can never be quite up to date. This difficulty has hitherto been met by the publication of such non-official formularies as Squire's *Companion to the Pharmacopoeia* and Martindale's *Extra Pharmacopoeia*, in which all new remedies and their preparations, uses and doses are recorded, and in the former the varying strengths of the same preparations in the different pharmacopoeias are also compared. The need of such works to supplement the Pharmacopoeia is shown by the fact that they are even more largely used than the Pharmacopoeia itself, the first having been issued in 18 and the second in 13 editions at comparatively short intervals. In England the task of elaborating a new Pharmacopoeia is entrusted to a body of a purely medical character, and legally the pharmacist has not, as in other countries, a voice in the matter, notwithstanding the fact that, although the medical practitioner is naturally the best judge of the drug or preparations that will afford the best therapeutic result, he is not so competent as the pharmacist to say how that preparation can be produced in the most effective and satisfactory manner, nor how the purity of drugs can be tested. In the preparation of the fourth edition of the *British Pharmacopoeia* in 1898 some new departures were made. A committee of the Pharmaceutical Society of Great Britain was appointed at the request of the General Medical Council to advise on pharmaceutical matters and the valuable assistance rendered by it is acknowledged in the preface of that work. A census of prescriptions was taken to ascertain the relative frequency with which different preparations and drugs were used in prescriptions, and suggestions and criticisms were sought from various medical and pharmaceutical bodies at home and in the colonies. As regards the purely pharmaceutical part of the work a committee of reference in pharmacy, nominated by the pharmaceutical societies of Great Britain and Ireland, was appointed to report to the Pharmacopoeia Committee of the Medical Council.

Some difficulty has arisen since the passing of the Adulteration of Food and Drugs Act concerning the use of the Pharmacopoeia as a legal standard for the drugs and preparations contained in it. The Pharmacopoeia is defined in the preface as only "intended to afford to the members of the medical profession and those engaged in the preparation of medicines throughout the British Empire one uniform standard and guide whereby the nature and composition of substances to be used in medicine may be ascertained and determined." It is obvious that it cannot be an encyclopaedia of substances used in medicine, and can only be used as a standard for the substances and preparations contained in it, and for no others. It has been held in the Divisional Courts (*Dickins* v. *Randerson*) that the Pharmacopoeia is a standard for official preparations asked for under their pharmacopoeial name. But there are many substances in the Pharmacopoeia which are not only employed in medicine, but have other uses, such as sulphur, benzoin, tragacanth, gum arabic, ammonium carbonate, beeswax, oil of turpentine, linseed oil, and for these a commercial standard of purity as distinct from a medicinal one is needed, since the preparations used in medicine should be of the highest possible degree of purity obtainable, and this standard would be too high and too expensive for ordinary purposes. The use of trade synonyms in the Pharmacopoeia, such as saltpetre for purified potassium nitrate, and milk of sulphur for precipitated sulphur, is partly answerable for this difficulty, and has proved to be a mistake, since it affords ground for legal prosecution if a chemist sells a drug of ordinary commercial purity for trade purposes, instead of the purified preparation which is official in the Pharmacopoeia for medicinal use. This would not be the case if the trade synonym were omitted. For many drugs and chemicals not in the Pharmacopoeia there is no standard of purity that can be used under the Adulteration of Food and Drugs Act, and for these, as well as for the commercial quality of those drugs and essential oils which are also in the Pharmacopoeia, a legal standard of commercial purity is much needed. This subject formed the basis of discussion at several meetings of the Pharmaceutical Society, and the results have been embodied in a work entitled *Suggested Standards for Foods and Drugs*, by C. G. Moor, which indicates the average degree of purity of many drugs and chemicals used in the arts, as well as the highest degree of purity obtainable in commerce of those used in medicine.

An important step has also been taken in this direction by the publication under the authority of the Council of the Pharmaceutical Society of Great Britain of the *British Pharmaceutical Codex*, in which the characters of and tests for the purity of many non-official drugs and preparations are given as well as the character of many glandular preparations and antitoxins that have come into use in medicine, but have not yet been introduced into the Pharmacopoeia. This work may also possibly serve as a standard under the Adulteration of Food and Drugs Act for the purity and strength of drugs not included in the Pharmacopoeia and as a standard for the commercial grade of purity of those in the Pharmacopoeia which are used for non-medical purposes.

Another legal difficulty connected with modern pharmacopoeias is the inclusion in some of them of synthetic chemical remedies, the processes for preparing which have been patented, whilst the substances are sold under trade-mark names such as veronal. The scientific chemical name is often long and unwieldy, and the physician prefers when writing a prescription to use the shorter name under which it is sold by the patentees. In this case the pharmacist is compelled to use the more expensive patented article and the patient complains of the price. If he uses the same article under its pharmacopoeial name when the patented article is prescribed he lays himself open to prosecution by the patentee for infringement of patent rights. The only plan, therefore, is for the physician to use the chemical name (which cannot be patented) as given in the Pharmacopoeia, or—for those synthetic remedies not included in the Pharmacopoeia—to use the scientific and chemical name given in the British Pharmaceutical Codex.

International Pharmacopoeia.—Increased facilities for travel have brought into greater prominence the importance of an approach to uniformity in the formulae of the more powerful remedies, in order to avoid danger to patients when a prescription is dispensed in a different country from that in which it was written. Attempts have been made by international pharmaceutical and medical conferences to settle a basis on which an international pharmacopoeia could be prepared; but, owing to national jealousies and the attempt to include too many preparations in such a work it has not as yet

been produced. The standardization of preparations of patent medicines as regards the amount of active principles they contain, can only conveniently and economically be done in operating on large quantities, and must naturally lead to the preparations being standardized at wholesale houses, who issue a guarantee with them; but it is not yet certain that deterioration may not take place after standardization, in such as those of ergot or digitalis, so that it is somewhat questionable whether the standardization is of permanent value in all cases. Probably more dependence is to be placed on careful selection of the drug, and skill in its preparation and preservation by the retail pharmacist, who should be personally responsible for the quality and purity of the preparations he sells. Although the attempt to form an international pharmacopoeia has failed, a project for an imperial pharmacopoeia which should be adapted to the general and local requirements of all parts of the British Empire has met with better success. With the aid of the medical and pharmaceutical authorities in each of the seventy administrative divisions of the British Empire an Indian and Colonial addendum to the *British Pharmacopoeia* of 1898 was compiled and published in 1900 in which each article receives official sanction in the countries indicated at the foot of the monographs. This was regarded as a preparatory step to the publication of a complete imperial pharmacopoeia.

Several unofficial universal pharmacopoeias have been published in England and in France, which serve to show the comparative strength of parallel preparations in different countries. The metric or decimal mode of calculation and the centigrade scale of temperature are adopted in all pharmacopoeias except those of Great Britain (in which the metric equivalents are now given) and in some instances of Greece. The majority omit chemical formulae. An alphabetical arrangement is followed in all. The maximum doses of preparations are given in several pharmacopoeias and the physician must indicate on his prescription, if he exceeds this limit, by using a note of exclamation after each article, that he purposely intends such a dose to be employed. The great increase of medical literature and international exchange of medical journals has led to the adoption in almost every country of all the really valuable remedial agents, and the more extended use of active principles has given rise to an approximation in strength of their solutions. The difficulty of nomenclature could probably be overcome by a list of synonyms being given with each article, and that of language by the use of Latin. The greatest stumbling-blocks in the way of uniformity are the tinctures and extracts—a class of preparations containing many very powerful drugs, but in which the same name does not always indicate the same thing; thus, extract of aconite signifies an extract of the root in the pharmacopoeias of the United States, Japan and Russia, extract of the leaves in the Danish and Portuguese, inspissated juice of the fresh leaves in the Greek, and alcoholic extract of the root in that of Spain and Italy, and alcoholic extract of the dried leaves in the Chilian pharmacopoeias. It appears probable, however, that the growth of pharmaceutical chemistry will indicate, in time, which of those in use form the most active and trustworthy preparations, while the general adoption of the metric system will lead to clearer approximation of strength than hitherto. The method adopted by the Portuguese Pharmacopoeia comes nearest to that uniformity which is so desirable in such preparations, as the tinctures of the fresh plants are all prepared with equal parts of the drug and alcoholic menstruum; simple tinctures in general, with unfortunately a few exceptions, with one part of the drug in five parts of alcohol of given strength; ethereal tinctures are in the proportion of one part in ten; and the tinctures of the alkaloids and their salts contain one part of the alkaloid in ninety-nine of menstruum.

Homoeopathic and eclectic practitioners as well as dentists have also their special pharmacopoeias.

See Bell and Redwood, *Progress of Pharmacy* (London, 1880); Scherer, *Literatura pharmacopoearum* (Leipzig and Sorau, 1822); Flint, *Report on the Pharmacopoeias of all Nations* (Washington, 83). (E. M. H.)

PHARMACOSIDERITE, a mineral species consisting of hydrated basic ferric arsenate, $2FeAsO_4 \cdot Fe(OH)_3 \cdot 5H_2O$. Crystals have the form of small, sharply defined cubes of an olive- or grass-green colour, and occur together in considerable numbers on the matrix of the specimens. On account of its cubic form the mineral was early known as "cube ore" (Ger. *Würfelerz*); the name pharmacosiderite, given by J. F. L. Hausmann in 1813, alludes to the arsenic and iron present (φάρμακον, poison, and σίδηρος, iron). The faces of the cube are striated parallel to one diagonal, and alternate corners are sometimes replaced by faces of a tetrahedron. The crystals are feebly doubly refracting, and in polarized light exhibit a banded structure parallel to the cube faces. The hardness is 2½ and the specific gravity 2·8. Recent analyses prove the presence of a small but variable amount of potassium (K_2O, 2·68–4·12 %) in the Cornish crystals, though in those from Hungary there is only a trace; this constituent appears to take the place of basic hydrogen in the above formula. A curious property is to be observed when a crystal of pharmacosiderite is placed in a solution of ammonia—in a few minutes the green colour changes throughout the whole crystal to red; on placing the red crystal in dilute hydrochloric acid the green colour is restored. Natural crystals are sometimes honey-yellow to brown in colour, but this appears to be due to alteration.

Pharmacosiderite is a mineral of secondary origin, the crystals occurring attached to gozzany quartz in the upper part of veins of copper ore. It was found in some abundance at the end of the 18th century in the copper mines of the St Day district in Cornwall, and has since been found at a few other localities, for example, at Königsberg near Schemnitz in Hungary, and in the Tintic district in Utah. (L. J. S.)

PHARMACY, a term which in the original Greek form signified the use of any kind of drug (φάρμακον), potion or spell, and hence also poison and witchcraft. In the modern signification it is applied to the act of preparing, preserving and compounding medicines, according to the prescriptions of physicians. It was used first in this sense in 1597.

In the earliest periods of the world's history of which we have any record, this art, like that of the perfumer, was practised by a special class of the priesthood, as in the case of Eleazar (Num. iv. 16), and that of medicine by another class (Lev. xiii.).

Egyptian inscriptions indicate that the physician-priests sent their prescriptions to be dispensed by the priests of Isis when, accompanied by the chanter of incantations and spells, they visited the sick.[1] A papyrus of Sent, 3300 B.C., gives directions as to the preparation of prescriptions. In the Ebers papyrus, 1550 B.C., mention is made of blisters, ointments, clysters, mineral and vegetable drugs. The art of the apothecary is alluded to very early in the Old Testament history (Exod. xxx. 25–35 and in xxxvii. 20) and again in the time of Solomon (Eccles. x. 9), but this word, which is translated *parfumeur* in the French version, only indicates that the preparation of fragrant unguents and incense formed, even at that early date, a part of pharmacy, since the drugs mentioned, viz. galbanum, myrrh, stacte, frankincense, calamus, cassia and cinnamon, were all of them used in perfumes, even the myrrh being probably the kind distinguished at the present time in the Bombay market as perfumed myrrh or bissabol, which still forms an ingredient of the joss sticks used as incense in the temples in China. The myrrh mentioned in Gen. xxxvii. 35 is described under another Hebrew word, and refers to ladanum, a fragrant resin produced in Cyprus, and the use of this drug, as well as that of cinnamon and cassia, indicates even at that early period a knowledge of the products of Somaliland, Arabia and the East Indies and the existence of trade between the farther East and Egypt. In China also at a very early period the art of pharmacy was practised. Ching-Hong, a contemporary of Menes I. of Egypt, was learned in the art, and made decoctions and extracts of plants. The materia medica of the Chinese at the present date affords an excellent illustration of the changes that have taken place in the use of drugs, and of the theories and superstitions that have guided the selection of these from the earliest ages, inasmuch as it still comprises articles that were formerly used in medicine, but have now been utterly discarded. Thus the doctrine of signatures is evident in the use of the celebrated Ginseng root of China, which, like that of the mandrake (Gen. xxx. 14–16), owed its employment to the fact that the root often divides into branches resembling the arms and legs of a man, and this resemblance gave rise to the belief that it conferred strength and virility. The same belief is shown in the botanical names applied to many plants, *e.g.* Pulmonaria, Hepatica, Scrophularia, and others.

The astrological belief that plants, animals and minerals are under the influence of the planets is shown in the older names of some of the metals, *e.g.* Saturn for lead, Venus for copper, and Mars for iron, and the belief that the colours of flowers

[1] The Egyptians believed that the medicinal virtues of plants were due to the spirits who dwelt within them.

indicated the particular planet they were under led to their use in diseases and for constitutions supposed to be under the same planet. Physicians to this day head their prescriptions with a sign that originally meant an invocation to Jupiter, but now represents the word *recipe*.

The belief, which is still held by the Chinese, that the excrements of animals retain the properties and peculiarities of the animals from which they are derived, led to the use in medicine of these disgusting remedies, which are still sold in drug shops in China, and were only omitted from the English Pharmacopoeia as late as 1721. At that date the science of chemistry was very imperfectly known, and the real constituents of ordinary remedies so little understood that different virtues were attributed to different products containing the same constituents. Thus, prepared oyster-shells, coral, pearls, crabs' "eyes" and burnt hart's horn were regarded as specifics in different complaints, in ignorance of the fact that they all contain, as the chief ingredients, calcium phosphate and carbonate. The celebrated Gascoigne's powder, which was sold as late as the middle of the 19th century in the form of balls like sal prunella, consisted of equal parts of crabs' "eyes," the black tips of crabs' claws, Oriental pearls, Oriental bezoar and white coral, and was administered in jelly made of hart's horn, but was prescribed by physicians chiefly for wealthy people, as it cost about forty shillings per ounce. Superstition also entered largely into the choice of remedies. Thus various parts of criminals, such as the thigh bone of a hanged man, moss grown on a human skull, &c., were used, and even the celebrated Dr Culpeper in the 17th century recommended "the ashes of the head of a coal black cat as a specific for such as have a skin growing over their sight."

In course of time the knowledge of drugs, and consequently the number in use, gradually increased, and some of the preparations made in accordance with the art attained a celebrity that lasted for centuries. Thus diachylon plaster was invented by Menecrates in A.D. 1, and was used by him for the same purposes as it is employed to-day. An electuary of opium, known as *Mithradatum*, was invented by Mithradates VI., king of Pontus, who lived in constant fear of being poisoned, and tested the effects of poisons on criminals, and is said to have taken poisons and their antidotes every day in the year. The prescription for the general antidote known as Mithradatum was found with his body, together with other medical MSS., by Pompey, after his victory over that king. The prescription was improved by Damocrates and Andromachus, body physicians to Nero. The first was subsequently known as *Mithradatum Damocratis*, and the second as *Theriaca Andromachi*, the name *Theriaca* or *Tiriaca* being derived from the snake called Tyrus, the flesh of which was added to it by Andromachus. The former contained 55, or, according to some formulae, 72 ingredients, and occurs in all the dispensatories, from that of Corvus Valerius up to the pharmacopoeias of the 19th century; and aromatic preparations of opium are still used, under the name of *Theriaka* in Persia. The *Theriaca* prepared at Venice had the highest reputation, probably because in Venice the component parts were exposed to the inspection of wise men and doctors for two months, to determine whether they were or were not fit for use. The apothecaries' ordinance at Nuremberg provided that no *Theriaca* should in future be branded with the seal of the city unless it had been previously examined and declared worthy of the same by the doctors of medicine, and that every druggist must know the age of the *Theriaca* he sold. Inasmuch as its action changed very materially with age, "the buyer should in all instances be informed, so that he may not be deceived." The last public preparation of *Theriaca* took place at Nuremberg in 1754.

In A.D. 77-78 Dioscorides of Anazarba, in Cilicia, wrote his great work on materia medica, which still remains the most important work on the plants and drugs used in ancient times (of which about 400 were enumerated) and until the 17th century was held as the most valuable guide to medicinal plants and drugs extant. Nearly 100 years afterwards Galen, the imperial physician at Rome (A.D. 131-200), who was learned in surgery, pharmacy and materia medica, added about 200 more plants to those described by Dioscorides.

Galen believed in the doctrine of humours originated by Hippocrates, which supposes the condition of the body to depend upon the proper mixture of the four elements, hot, cold, moist and dry, and that drugs possess the same elementary qualities, and that on the principle of contraries one or other was indicated, *e.g.* a cooling remedy for a feverish state. This doctrine was held for many centuries, and drugs are classed by all the old herbalists as having one or other of these qualities in a greater or less degree. Galen is said to have invented hiera-picra, which he employed as an anthelmintic; it is still used in England as a domestic remedy. In the 6th century Alexander of Tralles used colchicum for gout, iron for anaemia, and rhubarb in liver weakness and dysentery. The practice of pharmacy was extended by the Arabian physicians, and the separation of it from medicine was recognized in the 8th and legalized in the 11th century. The practice of "polypharmacy," or the use of a large number of ingredients in prescriptions, which was common in the middle ages, was greatly due to the view enunciated by Alkekendo, and held by one of the Arabian schools of medicine: that the activity of medicine increases in a duplicate ratio when compounded with others; and it was only in the first half of the 18th century that the practice was altogether discontinued in the pharmacopoeias, although the theory was shown to be incorrect by Averroes in the 12th century.

The establishments for dispensing medicines at Cordova, Toledo and other large towns under Arab rule, were placed under severe legal restrictions. Frederick II. in A.D. 1233 passed a law, which remained in force for a long time in the two Sicilies, by which every medical man was required to give information against any pharmacist who should sell bad medicine. The pharmacists were divided into two classes, the *stationarii*, who sold simple drugs and non-magisterial preparations at a tariff determined by competent authorities, and the *confectionarii*, whose business it was to dispense scrupulously the prescriptions of medical men; all pharmaceutical establishments were placed under the surveillance of the college of medicine. In the monastic period pharmacy was to a great extent under the control of the religious orders, particularly the Benedictines, who, from coming into contact with the Arabian physicians, devoted themselves to pharmacy, pharmacology and therapeutics; but, as monks were forbidden to shed blood, surgery fell largely into the hands of barbers, so that the class of barber-surgeons came into existence, and the sign of their skill in blood-letting still appears in provincial districts in England in the form of the barber's pole, representing the application of bandages.

In England the separation between medicine and pharmacy was somewhat later than on the continent of Europe. The earliest record of an apothecary's shop in London was in 1345. The status of the apothecary, as subordinate to the physician in the time of Henry VIII., is evident from the following, out of 21 rules laid down by a prominent apothecary, who was a cousin of Anne Boleyn: "His garden must be at hand, with plenty of herbs and seeds and roots. He must read Dioscorides. He must have mortars, pots, filters, glasses and boxes clean and sweet. He must have two places in the shop, one most clean for physic, and the base place for chirurgic stuff. He is neither to increase nor to diminish the physician's prescription; he is neither to buy nor to sell rotten drugs. He is only to meddle in his own vocation; and to remember that his office is only to be the physician's cook."

The drugs used by the physicians and apothecaries were purchased from the grossarii or sellers in gross, who were subsequently called grocers, some of whom specialized as druggists and others as chymists or chemists. The apothecaries, who were the pharmacists of those days, were not represented by any corporate body, but in the reign of King James I., in 1606, were incorporated with the Company of Grocers. This arrangement was not, however, approved of by the physicians, who obtained in 1617 a separate charter for the apothecaries, to the number of 114, which was the number of physicians then

practising in London. At the same time it was enacted that no grocer should keep an apothecary's shop, and that no surgeon should sell medicines, and that the physicians should have the power to search the shops of the apothecaries within 7 m. of London under a penalty of £100 in case of a refusal to permit it. Soon after the apothecaries were formed into a separate company they took into consideration means to prevent the frauds and adulterations practised by the grocers and druggists, and, to remedy the evil, established a manufactory of their own in 1626 so that they might make preparations for their own members. The frauds and adulterations were probably due in part to the apothecaries, for Dr Merrit, a collegiate physician of London, stated that "such chymists which sell preparations honestly made complain that few apothecaries will go to the price of them." The medicinal preparations which required the aid of a furnace, such as mineral earths, were undertaken by the chymists, who probably derived their name from the Alchymists, who flourished from the 14th to the 16th centuries. When the word was discovered to be derived from an Arabic prefix and a Greek word the prefix was dropped. In the 19th century the word chymist became altered to chemist, although the original spelling is still continued to a small extent. The curious signs on the coloured carboys in chemists' windows, which were commonly to be seen until the middle of the 19th century, were signs used by the alchemists to indicate various chemical substances. In 1694 the apothecaries had increased from 114 to nearly 1000, and many of them, having acquired a knowledge of the uses of medicine, began to prescribe medicines for their customers and to assume the functions of the physician, who retorted in 1697 by establishing dispensaries, where medicines could be procured at their intrinsic value, or at cost price. The assistants employed at these dispensaries after a time appear to have gone into business on their own account, and in this way the dispensing chemists, as a class, appear to have originated.

In 1748 the Apothecaries' Corporation obtained a charter empowering them to license apothecaries to sell medicines in London, or within 7 m., and intended to use it to restrain chemists and druggists from practising pharmacy, and to prohibit physicians and surgeons from selling the medicines they prescribed; but the apothecaries, by paying increased attention to medical and surgical practice, had not only alienated the physicians and surgeons, but materially strengthened the position of chemists and druggists as dispensers of prescriptions. When a further attempt was made in 1815 to bring a bill into parliament including provisions for prohibiting the practice of pharmacy by uneducated persons, and giving power to examine dispensing chemists, the latter became alarmed, and, finding that the provisions of the bill were entirely in the interests of the apothecaries, and directed against chemists and druggists, the latter took measures to oppose it in parliament, which were so far successful as to prevent apothecaries from interfering in any way with, or obtaining any control over, chemists and druggists. In 1841 another attempt was made by the apothecaries to control the trade of chemists and druggists on the ground that no adequate examination or education in pharmacy existed, and that such should be instituted, and be controlled by the apothecaries and physicians, but the latter disclaimed any desire to take an active part in the matter. The chemists and druggists, recognizing that no institution for the systematic education and examination of chemists and druggists existed in England, and that no proof could be given that each individual possessed the necessary qualifications, decided that this objection must be met, and that pharmacy must be placed upon a more scientific footing. They therefore resolved upon the foundation of a voluntary society, under the title of the Pharmaceutical Society of Great Britain, "for advancing the knowledge of chemistry and pharmacy, and promoting a uniform system of education for those who should practise the same, also for protecting the collective and individual interests and privileges of all its members, in the event of any hostile attack in parliament or elsewhere." This society was instituted in 1841, the original founders being chemists and druggists in the metropolis and provincial towns. On the 18th of February 1843 a royal charter of incorporation was granted to the society, and a permanent status was thus acquired. Chemists in business before the granting of the charter were entitled to join the society as members, but those who wished to join it subsequently could do so only on condition of passing an examination for the purpose of testing their knowledge of pharmacy. A school of pharmacy was instituted, and a museum and library were started. The chemical laboratory in connexion with the school was, when first instituted, the only one in England for teaching purposes, and the museum is now reputed to be the best pharmaceutical one in the world, the library now containing about 13,000 volumes.

The examinations are three in number. The first is of a preliminary character, qualifying for registration as a student or apprentice; in lieu of this examination, certificates of matriculation at a university, and those of certain other educational bodies, are accepted. The second examination qualifies for registration as a chemist and druggist. This is known as the minor examination, and must be passed before anyone can legally dispense, compound and sell scheduled poisons. The subjects included are systematic botany, vegetable morphology and physiology, chemistry, physics, materia medica, pharmacy, dispensing, posology, the reading of prescriptions, and a knowledge of poisons and their antidotes. The Poisons and Pharmacy Act of 1908 (section 4) has given the society power to regulate the preliminary training, arrange a curriculum, and divide the qualifying examination into two parts, so that an approximation to the standard of pharmaceutical education on the Continent is likely to take place within a short period. Degrees in science and pharmacy are granted by the universities of Manchester and Glasgow, and other universities were in 1910 considering the question of granting degrees.

The third, or major examination, which qualifies for registration as a pharmaceutical chemist, is not, like the minor, a compulsory one, but ranks as an honours examination. The education for this examination has kept pace with the rapid advances of science, all the following subjects now receiving attention: the microscopical structure of plants and drugs, so as to detect adulterations and impurities in powdered drugs; organic and quantitative analysis, including those of food and drugs, water, soils, gas and urine; optics, so as to enable them to carry out the prescriptions of oculists; spectrum analysis; the use of the polariscope and refractometer; the method of applying Röntgen rays; the preparation of glandular secretions and antitoxins; and the chemistry of remedies for the fungoid diseases and insect pests of plants.

Those who have passed this examination are competent to perform analysis of all kinds, and generally obtain the preference for various appointments, such as head dispensers in government or other large hospitals, or as analysts. The society has also established a chemical research laboratory, in which much useful work has been done in connexion with the national pharmacopoeia under the direction of the Pharmacopoeia Committee of the Medical Council.

A pharmacy act, which was passed in 1852, established a distinction between registered and examined, and unregistered and unexamined chemists and druggists, creating a register of the former under the name of pharmaceutical chemists, so that the public might discriminate between the two classes. A subsequent pharmacy act, passed in 1868, added a register of chemists and druggists, and rendered it unlawful for any unregistered person to sell or keep open shop for selling the poisons mentioned in the schedule of this act. The administration of the act was entrusted to the pharmaceutical society, and the duty of prosecuting unauthorized practitioners has been performed by the society ever since, without any pecuniary assistance from the state, although the legal expenses involved in prosecution amount to a considerable portion of its income.

The Poisons and Pharmacy Act of 1908 extended the schedule of poisons instituted by the act of 1868, and it now includes arsenic, aconite, aconitine and their preparations; all poisonous vegetable alkaloids, and their salts and poisonous derivatives; atropine and its salts and their preparations; belladonna and all preparations or admixtures (except belladonna plasters) containing 0·1 % or more of belladonna alkaloid; cantharides and its poisonous derivatives; any preparation or admixture of coca-leaves containing 0·1 % or more of coca alkaloids; corrosive sublimate; cyanide of potassium and all poisonous cyanides and their preparations; tartar emetic, nux vomica, and all

indicated the particular planet they were under led to their use in diseases and for constitutions supposed to be under the same planet. Physicians to this day head their prescriptions with a sign that originally meant an invocation to Jupiter, but now represents the word *recipe*.

The belief, which is still held by the Chinese, that the excrements of animals retain the properties and peculiarities of the animals from which they are derived, led to the use in medicine of these disgusting remedies, which are still sold in drug shops in China, and were only omitted from the English Pharmacopoeia as late as 1721. At that date the science of chemistry was very imperfectly known, and the real constituents of ordinary remedies so little understood that different virtues were attributed to different products containing the same constituents. Thus, prepared oyster-shells, coral, pearls, crabs' "eyes" and burnt hart's horn were regarded as specifics in different complaints, in ignorance of the fact that they all contain, as the chief ingredients, calcium phosphate and carbonate. The celebrated Gascoigne's powder, which was sold as late as the middle of the 19th century in the form of balls like sal prunella, consisted of equal parts of crabs' "eyes," the black tips of crabs' claws, Oriental pearls, Oriental bezoar and white coral, and was administered in jelly made of hart's horn, but was prescribed by physicians chiefly for wealthy people, as it cost about forty shillings per ounce. Superstition also entered largely into the choice of remedies. Thus various parts of criminals, such as the thigh bone of a hanged man, moss grown on a human skull, &c., were used, and even the celebrated Dr Culpeper in the 17th century recommended "the ashes of the head of a coal black cat as a specific for such as have a skin growing over their sight."

In course of time the knowledge of drugs, and consequently the number in use, gradually increased, and some of the preparations made in accordance with the art attained a celebrity that lasted for centuries. Thus diachylon plaster was invented by Menecrates in A.D. 1, and was used by him for the same purposes as it is employed to-day. An electuary of opium, known as *Mithradatum*, was invented by Mithradates VI., king of Pontus, who lived in constant fear of being poisoned, and tested the effects of poisons on criminals, and is said to have taken poisons and their antidotes every day in the year. The prescription for the general antidote known as Mithradatum was found with his body, together with other medical MSS., by Pompey, after his victory over that king. The prescription was improved by Damocrates and Andromachus, body physicians to Nero. The first was subsequently known as *Mithradatum Damocratis*, and the second as *Theriaca Andromachi*, the name *Theriaca* or *Tiriaca* being derived from the snake called Tyrus, the flesh of which was added to it by Andromachus. The former contained 55, or, according to some formulae, 72 ingredients, and occurs in all the dispensatories, from that of Corvus Valerius up to the pharmacopoeias of the 19th century; and aromatic preparations of opium are still used, under the name of *Theriaka* in Persia. The *Theriaca* prepared at Venice had the highest reputation, probably because in Venice the component parts were exposed to the inspection of wise men and doctors for two months, to determine whether they were or were not fit for use. The apothecaries' ordinance at Nuremberg provided that no *Theriaca* should in future be branded with the seal of the city unless it had been previously examined and declared worthy of the same by the doctors of medicine, and that every druggist must know the age of the *Theriaca* he sold. Inasmuch as its action changed very materially with age, "the buyer should in all instances be informed, so that he may not be deceived." The last public preparation of *Theriaca* took place at Nuremberg in 1754.

In A.D. 77-78 Dioscorides of Anazarba, in Cilicia, wrote his great work on materia medica, which still remains the most important work on the plants and drugs used in ancient times (of which about 400 were enumerated) and until the 17th century was held as the most valuable guide to medicinal plants and drugs extant. Nearly 100 years afterwards Galen, the imperial physician at Rome (A.D. 131-200), who was learned in surgery, pharmacy and materia medica, added about 200 more plants to those described by Dioscorides.

Galen believed in the doctrine of humours originated by Hippocrates, which supposes the condition of the body to depend upon the proper mixture of the four elements, hot, cold, moist and dry, and that drugs possess the same elementary qualities, and that on the principle of contraries one or other was indicated, *e.g.* a cooling remedy for a feverish state. This doctrine was held for many centuries, and drugs are classed by all the old herbalists as having one or other of these qualities in a greater or less degree. Galen is said to have invented hiera-picra, which he employed as an anthelmintic; it is still used in England as a domestic remedy. In the 6th century Alexander of Tralles used colchicum for gout, iron for anaemia, and rhubarb in liver weakness and dysentery. The practice of pharmacy was extended by the Arabian physicians, and the separation of it from medicine was recognized in the 8th and legalized in the 11th century. The practice of "polypharmacy," or the use of a large number of ingredients in prescriptions, which was common in the middle ages, was greatly due to the view enunciated by Alkekendo, and held by one of the Arabian schools of medicine: that the activity of medicine increases in a duplicate ratio when compounded with others; and it was only in the first half of the 18th century that the practice was altogether discontinued in the pharmacopoeias, although the theory was shown to be incorrect by Averroes in the 12th century.

The establishments for dispensing medicines at Cordova, Toledo and other large towns under Arab rule, were placed under severe legal restrictions. Frederick II. in A.D. 1233 passed a law, which remained in force for a long time in the two Sicilies, by which every medical man was required to give information against any pharmacist who should sell bad medicine. The pharmacists were divided into two classes, the *stationarii*, who sold simple drugs and non-magisterial preparations at a tariff determined by competent authorities, and the *confectionarii*, whose business it was to dispense scrupulously the prescriptions of medical men; all pharmaceutical establishments were placed under the surveillance of the college of medicine. In the monastic period pharmacy was to a great extent under the control of the religious orders, particularly the Benedictines, who, from coming into contact with the Arabian physicians, devoted themselves to pharmacy, pharmacology and therapeutics; but, as monks were forbidden to shed blood, surgery fell largely into the hands of barbers, so that the class of barber-surgeons came into existence, and the sign of their skill in blood-letting still appears in provincial districts in England in the form of the barber's pole, representing the application of bandages.

In England the separation between medicine and pharmacy was somewhat later than on the continent of Europe. The earliest record of an apothecary's shop in London was in 1345. The status of the apothecary, as subordinate to the physician in the time of Henry VIII., is evident from the following, out of 21 rules laid down by a prominent apothecary, who was a cousin of Anne Boleyn: "His garden must be at hand, with plenty of herbs and seeds and roots. He is neither to increase nor to diminish the physician's prescription; he is neither to buy nor to sell rotten drugs. He is only to meddle in his own vocation; and to remember that his office is only to be the physician's cook."

The drugs used by the physicians and apothecaries were purchased from the grossarii or sellers in gross, who were subsequently called grocers, some of whom specialized as druggists and others as chymists or chemists. The apothecaries, who were the pharmacists of those days, were not represented by any corporate body, but in the reign of King James I., in 1606, were incorporated with the Company of Grocers. This arrangement was not, however, approved of by the physicians, who obtained in 1617 a separate charter for the apothecaries, to the number of 114, which was the number of physicians then

PHARNABAZUS, Persian soldier and statesman, the son of Pharnaces, belonged to a family which from 478 governed the satrapy of Phrygia on the Hellespont, from its headquarters at Dascylium, and, according to a discovery by Th. Nöldeke, was descended from Otanes, one of the associates of Darius in the murder of Smerdis. Pharnabazus first appears as satrap of this province in 413, when, having received orders from Darius II. to send in the outstanding tribute of the Greek cities on the coast, he, like Tissaphernes of Caria, entered into negotiations with Sparta and began war with Athens. The conduct of the war was much hindered by the rivalry between the two satraps, of whom Pharnabazus was by far the more energetic and upright. After the war he came into conflict with Lysander (*q.v.*: see also PELOPONNESIAN WAR), who tried to keep the Greek cities under his own dominion, and became one of the causes of his overthrow, by a letter which he sent to the ephors at Sparta (Plut. *Lys.* 19; Nepos, *Lys.* 4; Polyaen. vii. 19). He received Alcibiades at his court and promised him means to go up to the king to reveal the intrigues of Cyrus, but when the Spartans insisted on his death he yielded to their demand for his assassination (Plut. *Alcib.* 37 sqq.; Diod. xiv. 11). When in 399 the war with Sparta broke out he again tried to conduct it strenuously. With the help of Conon and Evagoras of Salamis he organized the Persian fleet, and while he was hard pressed on land by Agesilaus he prepared the decisive sea-battle, which was fought in August 394 at Cnidus under his and Conon's command, and completely destroyed the Spartan fleet. He sent support to the allies in Greece, by which the walls of the Peiraeus were rebuilt. But in the war on land he struggled in vain against the lethargy and disorganization of the Persian Empire; and when at last, in 387, in consequence of the embassy of Antalcidas to Susa, the king decided to conclude peace with Sparta and to enter again into close alliance with her, Pharnabazus, the principal opponent of Sparta, was recalled from his command in high honours, to marry Apame, a daughter of the king (Plut. *Artax.* 27). In 385 he was one of the generals sent against Egypt, and in 377 he was ordered to prepare a new expedition against the valley of the Nile. The gathering of the army took years, and when in 373 all was ready, his attempt to force the passage of the Nile failed. A conflict with Iphicrates, the leader of the Greek mercenaries, increased the difficulties; at last Pharnabazus led the army back to Asia. From these campaigns date the silver coins with the name of Pharnabazus in Aramaic writing. When he died is not known.

In the time of Alexander we meet with a Persian general Pharnabazus, son of Artabazus (Arrian ii. 1 seq.), who probably was the grandson of the older Pharnabazus.

The name Pharnabazus is also borne by a king of Iberia (Georgia) on the Caucasus, where the dynasty seems to have been of Persian origin, defeated by a general of Marcus Antonius (Mark Antony) in 36 B.C. (Dio Cass. xlix. 24). In the Georgian dynasty the name occurs as late as the 19th century. (ED. M.)

PHARYNGITIS. The pharynx, or upper portion of the gullet (seen to a large extent on looking at the back of the mouth) is frequently the seat of a chronic inflammatory condition, usually associated with derangements of the digestive organs, or with syphilis or gout; sometimes it is due to much speaking or to excessive tobacco-smoking—especially of cigarettes. On inspection, the inflamed mucous membrane is seen unduly red and glazed, and dotted over with enlarged follicles. The condition produces considerable irritation and "dryness," with cough and discomfort, which may eventually become chronic. Treatment consists in removing all sources of irritation, in rectifying gastric disturbance, and in the application of the electric cautery, of astringent lotions or of mild caustic solutions. The pain may be relieved by spraying with certain anodyne solutions. In the case of adenoid growths (see ADENOIDS) there is often an associated granular appearance of the pharynx, due to enlargement of the minute glands of the mucous membrane. The inflamed pharynx of the orator ("clergyman's sore-throat") may be put right by lessons in elocution or by complete rest for a time. The gouty throat may call for a change of diet, or for a stay at one of the watering-places where early rising, moderate food, regular exercise and the drinking of laxative waters join in restoring health. (E. O.*)

PHARYNX (Gr. φάρυγξ, throat), in anatomy, the cavity into which both the nose and mouth lead, which is prolonged into the oesophagus or gullet below, and from which the larynx or air tube comes off below and in front; it therefore serves as a passage both for food and air. It may be likened to an empty sack turned upside down and narrowing toward its mouth. The back and sides of the sack are formed by the three constrictor muscles of the pharynx, each of which overlaps the outer surface of the one above it, and these are lined internally by thick mucous membrane. The upturned bottom of the sack is attached firmly to the base of the skull and the internal pterygoid plates, so that this part cannot collapse, but below the anterior and posterior walls are in contact, and a transverse section of the pharynx is a mere slit.

From the front wall, on a level with the floor of the nose and roof of the mouth, a slanting shelf of muscular and glandular tissue, covered with mucous membrane, projects downward and backward into the cavity, and divides it into an upper part or naso-pharynx and a lower or oral pharynx (see fig.). This shelf is the *soft palate*, and from the middle of its free border hangs a worm-like projection, of variable length but averaging about half an inch, the *uvula*. The whole of the front wall of the naso-pharynx is wanting, and here the cavity opens into the nose through the posterior nasal apertures (see OLFACTORY SYSTEM). On each side of the naso-pharynx, and therefore above the soft palate, is the large triangular opening of the Eustachian tube through which air passes to the tympanum (see EAR). Behind this opening, and reaching up to the roof of the naso-pharynx, is a mass of lymphoid tissue, most marked in children, known as the pharyngeal tonsil. This tissue, when it hypertrophies, causes the disease known as "adenoids."

From the mid-line of the roof of the pharynx a small pouch, the *bursa pharyngea*, best seen in childhood, projects upward, while on each side, above and behind the opening of the Eustachian tube, is a depression known as the lateral recess of the pharynx.

The oral pharynx communicates with the naso-pharynx by the pharyngeal isthmus behind the free edge of the soft palate. Above and in front it is continuous with the cavity of the mouth, and the demarcation between the two is a ridge of mucous membrane on each side running from the soft palate to the side of the tongue, and caused by the projection of the palato-glossus muscle. This is known as the anterior pillar of the fauces or anterior palatine arch. About half an inch behind this ridge is another, made by the palato-pharyngeus muscle, which gradually fades away in the side of the pharynx below. This is the posterior pillar of the fauces or posterior palatine arch, and between it and the anterior is the fossa (tonsilar sinus) in which the tonsil lies.

The *Tonsil* is an oval mass of lymphoid tissue covered by mucous membrane which dips in to form mucous crypts; externally its position nearly corresponds to that of the angle of the jaw. It is very vascular, deriving its blood from five neighbouring arteries. Below the level of the tonsil the anterior wall of the pharynx is formed by the posterior or pharyngeal surface of the tongue (*q.v.*), while below that is the epiglottis and upper opening of the larynx which is bounded laterally by the aryteno epiglottic folds (see RESPIRATORY SYSTEM). On the lateral side of each of these folds is a pear-shaped fossa known as the *sinus pyriformis*. Below this the pharynx narrows rapidly until the level of the lower border of the cricoid cartilage in front and of the sixth cervical vertebra behind is reached; here it passes into the oesophagus, having reached a total length of about five inches.

The mucous membrane of the naso-pharynx, like that of the rest of the respiratory tract, is lined by ciliated columnar epithelium, but in the oral pharynx the epithelium is of the stratified squamous variety. Numerous racemose glands are present (see EPITHELIAL TISSUES), as well as patches of lymphoid tissue especially in childhood. Outside the mucous membrane and separating it from the constrictor muscles is the pharyngeal aponeurosis, which blends above with the periosteum of the base of the skull.

Embryology.—The pharynx is partly formed from the ectodermal stomatodaeal invagination (see EMBRYOLOGY and MOUTH) and partly from the fore gut, which is the cephalic part of the entodermal mesodaeum. Up to the fifteenth day (see MOUTH), the bucco-pharyngeal membrane separates these structures, and, though no vestiges of it remain, it is clear that the upper and front part of the naso-pharynx is stomatodaeal while the rest is mesodaeal. The five visceral arches with their intervening clefts or pouches surround the pharynx, and the Eustachian tube is a remnant of the first of these. The second pouch is represented in the adult by the tonsilar sinus, and until lately the lateral recess of the pharynx was looked upon as part of the same, but it has now been shown to be an independent diverticulum. The *sinus pyriformis* probably represents that part of the fourth groove from which the lateral lobes of the thyroid body are derived.

indicated the particular planet they were under led to their use in diseases and for constitutions supposed to be under the same planet. Physicians to this day head their prescriptions with a sign that originally meant an invocation to Jupiter, but now represents the word *recipe*.

The belief, which is still held by the Chinese, that the excrements of animals retain the properties and peculiarities of the animals from which they are derived, led to the use in medicine of these disgusting remedies, which are still sold in drug shops in China, and were only omitted from the English Pharmacopoeia as late as 1721. At that date the science of chemistry was very imperfectly known, and the real constituents of ordinary remedies so little understood that different virtues were attributed to different products containing the same constituents. Thus, prepared oyster-shells, coral, pearls, crabs' "eyes" and burnt hart's horn were regarded as specifics in different complaints, in ignorance of the fact that they all contain, as the chief ingredients, calcium phosphate and carbonate. The celebrated Gascoigne's powder, which was sold as late as the middle of the 19th century in the form of balls like sal prunella, consisted of equal parts of crabs' "eyes," the black tips of crabs' claws, Oriental pearls, Oriental bezoar and white coral, and was administered in jelly made of hart's horn, but was prescribed by physicians chiefly for wealthy people, as it cost about forty shillings per ounce. Superstition also entered largely into the choice of remedies. Thus various parts of criminals, such as the thigh bone of a hanged man, moss grown on a human skull, &c., were used, and even the celebrated Dr Culpeper in the 17th century recommended "the ashes of the head of a coal black cat as a specific for such as have a skin growing over their sight."

In course of time the knowledge of drugs, and consequently the number in use, gradually increased, and some of the preparations made in accordance with the art attained a celebrity that lasted for centuries. Thus diachylon plaster was invented by Menecrates in A.D. 1, and was used by him for the same purposes as it is employed to-day. An electuary of opium, known as *Mithradatum*, was invented by Mithradates VI., king of Pontus, who lived in constant fear of being poisoned, and tested the effects of poisons on criminals, and is said to have taken poisons and their antidotes every day in the year. The prescription for the general antidote known as Mithradatum was found with his body, together with other medical MSS., by Pompey, after his victory over that king. The prescription was improved by Damocrates and Andromachus, body physicians to Nero. The first was subsequently known as *Mithradatum Damocratis*, and the second as *Theriaca Andromachi*, the name *Theriaca* or *Tiriaca* being derived from the snake called Tyrus, the flesh of which was added to it by Andromachus. The former contained 55, or, according to some formulae, 72 ingredients, and occurs in all the dispensatories, from that of Corvus Valerius up to the pharmacopoeias of the 19th century; and aromatic preparations of opium are still used, under the name of *Theriaka* in Persia. The *Theriaca* prepared at Venice had the highest reputation, probably because in Venice the component parts were exposed to the inspection of wise men and doctors for two months, to determine whether they were or were not fit for use. The apothecaries' ordinance at Nuremberg provided that no *Theriaca* should in future be branded with the seal of the city unless it had been previously examined and declared worthy of the same by the doctors of medicine, and that every druggist must know the age of the *Theriaca* he sold. Inasmuch as its action changed very materially with age, "the buyer should in all instances be informed, so that he may not be deceived." The last public preparation of *Theriaca* took place at Nuremberg in 1754.

In A.D. 77-78 Dioscorides of Anazarba, in Cilicia, wrote his great work on materia medica, which still remains the most important work on the plants and drugs used in ancient times (of which about 400 were enumerated) and until the 17th century was held as the most valuable guide to medicinal plants and drugs extant. Nearly 100 years afterwards Galen, the imperial physician at Rome (A.D. 131-200), who was learned in surgery, pharmacy and materia medica, added about 200 more plants to those described by Dioscorides.

Galen believed in the doctrine of humours originated by Hippocrates, which supposes the condition of the body to depend upon the proper mixture of the four elements, hot, cold, moist and dry, and that drugs possess the same elementary qualities, and that on the principle of contraries one or other was indicated, *e.g.* a cooling remedy for a feverish state. This doctrine was held for many centuries, and drugs are classed by all the old herbalists as having one or other of these qualities in a greater or less degree. Galen is said to have invented hiera-picra, which he employed as an anthelmintic; it is still used in England as a domestic remedy. In the 6th century Alexander of Tralles used colchicum for gout, iron for anaemia, and rhubarb in liver weakness and dysentery. The practice of pharmacy was extended by the Arabian physicians, and the separation of it from medicine was recognized in the 8th and legalized in the 11th century. The practice of "polypharmacy," or the use of a large number of ingredients in prescriptions, which was common in the middle ages, was greatly due to the view enunciated by Alkekendo, and held by one of the Arabian schools of medicine: that the activity of medicine increases in a duplicate ratio when compounded with others; and it was only in the first half of the 18th century that the practice was altogether discontinued in the pharmacopoeias, although the theory was shown to be incorrect by Averroes in the 12th century.

The establishments for dispensing medicines at Cordova, Toledo and other large towns under Arab rule, were placed under severe legal restrictions. Frederick II. in A.D. 1233 passed a law, which remained in force for a long time in the two Sicilies, by which every medical man was required to give information against any pharmacist who should sell bad medicine. The pharmacists were divided into two classes, the *stationarii*, who sold simple drugs and non-magisterial preparations at a tariff determined by competent authorities, and the *confectionarii*, whose business it was to dispense scrupulously the prescriptions of medical men; all pharmaceutical establishments were placed under the surveillance of the college of medicine. In the monastic period pharmacy was to a great extent under the control of the religious orders, particularly the Benedictines, who, from coming into contact with the Arabian physicians, devoted themselves to pharmacy, pharmacology and therapeutics; but, as monks were forbidden to shed blood, surgery fell largely into the hands of barbers, so that the class of barber-surgeons came into existence, and the sign of their skill in blood-letting still appears in provincial districts in England in the form of the barber's pole, representing the application of bandages.

In England the separation between medicine and pharmacy was somewhat later than on the continent of Europe. The earliest record of an apothecary's shop in London was in 1345. The status of the apothecary, as subordinate to the physician in the time of Henry VIII., is evident from the following, out of 21 rules laid down by a prominent apothecary, who was a cousin of Anne Boleyn: "His garden must be at hand, with plenty of herbs and seeds and roots. He must read Dioscorides. He must have mortars, pots, filters, glasses and boxes clean and sweet. He must have two places in the shop, one most clean for physic, and the base place for chirurgic stuff. He is neither to increase nor to diminish the physician's prescription; he is neither to buy nor to sell rotten drugs. He is only to meddle in his own vocation; and to remember that his office is only to be the physician's cook."

The drugs used by the physicians and apothecaries were purchased from the grossarii or sellers in gross, who were subsequently called grocers, some of whom specialized as druggists and others as chymists or chemists. The apothecaries, who were the pharmacists of those days, were not represented by any corporate body, but in the reign of King James I., in 1606, were incorporated with the Company of Grocers. This arrangement was not, however, approved of by the physicians, who obtained in 1617 a separate charter for the apothecaries, to the number of 114, which was the number of physicians then

alternative of two partridges or other birds among the "pitantiae" (rations of commons, as we might now say) of the canons of Waltham Abbey, and, as W. B. Dawkins has remarked (*Ibis*, 1869, p. 358), neither Anglo-Saxons nor Danes were likely to have introduced it into England. It seems to have been early under legal protection, for, according to Dugdale, a licence was granted in the reign of Henry I. to the abbot of Amesbury to kill hares and pheasants, and from the price at which the latter are reckoned in various documents, we may conclude that they were not very abundant for some centuries, and also that they were occasionally artificially reared and fattened, as appears from Upton,[1] who wrote about the middle of the 15th century, while Henry VIII. seems from his privy purse expenses to have had in his household in 1532 a French priest as a regular "fesaunt breder," and in the accounts of the Kytsons of Hengrave in Suffolk for 1607 mention is made of wheat to feed pheasants, partridges and quails.

The practice of bringing up pheasants by hand is now extensively followed, and the numbers so reared vastly exceed those that are bred at large. The eggs are collected from birds that are either running wild or kept in pens, and are placed under domestic hens; but, though these prove most attentive foster-mothers, much additional care on the part of their keepers is needed to ensure the arrival at maturity of the poults; for, being necessarily crowded in a comparatively small space, they are subject to several diseases which often carry off a large proportion, to say nothing of the risk they run by not being provided with proper food, or by meeting an early death from various predatory animals attracted by the assemblage of so many helpless victims. As they advance in age the young pheasants readily take to a wild life, and indeed can only be kept from wandering in every direction by being plentifully supplied with food, which has to be scattered for them in the coverts in which it is desired that they should stay. The proportion of pheasants artificially bred that "come to the gun" would seem to vary enormously, not only irregularly according to the weather, but regularly according to the district. In the eastern counties of England, and some other favourable localities, perhaps three-fourths of those that are hatched may be satisfactorily accounted for; but in many of the western counties, though they are the objects of equal or even greater care, it would seem that more than half of the number that live to grow their feathers disappear inexplicably before the coverts are beaten. For the sport of pheasant-shooting see SHOOTING.

Formerly pheasants were taken in snares or nets, and by hawking; but the crossbow was also used, and the better to obtain a "sitting shot"—for with that weapon men had not learnt to "shoot flying"—dogs appear to have been employed in the way indicated by the lines under an engraving by Hollar, who died in 1677:—

> "The Feasant Cocke the woods doth most frequent,
> Where Spaniells spring and pearche him by the sent."[2]

Of the many other species of the genus *Phasianus*, two only can be dwelt upon here. These are the ring-necked pheasant of China, *P. torquatus*, easily known by the broad white collar, whence it has its name, as well as by the pale greyish-blue of its upper wing-coverts and rump and the light buff of its flanks, and the *P. versicolor* of Japan, often called the green pheasant from the beautiful tinge of that colour that in certain lights pervades almost the whole of its plumage, and, deepening into dark emerald, occupies all the breast and lower surface that in the common and Chinese birds is bay barred with glossy black scallops. Both of these species have been introduced into England, and cross freely with *P. colchicus*, while the hybrids of each with the older inhabitants of the woods are not only perfectly fertile *inter se*, but cross as freely with the other hybrids, so that birds are frequently found in which the blood of the three species is mingled. The hybrids of the first cross are generally larger than either of their parents, but the superiority of size does not seem to be maintained by their descendants. White and pied varieties of the common pheasant, as of most birds, often occur, and with a little care a race or breed of each can be perpetuated. A much rarer variety is sometimes seen; this is known as the Bohemian pheasant, not that there is the least reason to suppose it has any right to such an epithet, for it appears, as it were, accidentally among a stock of the pure *P. colchicus*, and offers an example analogous to that of the Japan peafowl (see PEACOCK), being, like that breed, capable of perpetuation by selection. Two other species of pheasant have been introduced to the coverts of England—*P. reevesi* from China, remarkable for its very long tail, white with black bars, and the copper pheasant, *P. soemmerringi*, from Japan. The well-known gold and silver pheasants, *P. pictus* and *P. nycthemerus*, each the type of a distinct section or subgenus, are both from China and have long been introduced into Europe, but are only fitted for the aviary. To the former is allied the still more beautiful *P. amherstiae*, and to the latter about a dozen more species, most of them known to Indian sportsmen by the general name of "kaleege." The comparatively plain pucras pheasants, *Pucrasia*, the magnificent monauls, *Lophophorus*, and the fine snow-pheasants, *Crossoptilum*—of each of which genera there are several species, may also be mentioned.

All the species known at the time are beautifully figured from drawings by J. Wolf in D. G. Elliot's *Monograph of the Phasianidae* (2 vols. fol., 1870-1872)—the last term being used in a somewhat general sense. With a more precise scope W. B. Tegetmeier's *Pheasants: their Natural History and Practical Management* (4th ed., 1904) is to be commended as a very useful work. (A. N.)

statements so as to find out the original word rendered "pheasant" by the translator; but a reference to what is probably the same passage with the same meaning is given by Ray (*Synops. meth. animalium*, pp. 213, 214) on the authority of Llwyd or Lloyd, though there is no mention of it in Wotton and Clarke's *Leges Wallicae* (1730). A charter (Kemble, *Cod. diplom.* iv. 236), professedly of Edward the Confessor, granting the wardenship of certain forests in Essex to Ralph Peperking, speaks of "fesant hen" and "fesant cocke," but is now known to be spurious.

[1] In his *De studio militari* (not printed till 1654) he states (p. 195) that the pheasant was brought from the East by "Palladius ancorista."

[2] Quoted by the writer (Broderip?) of the article "Spaniel" in the *Penny Cyclopaedia*. The lines throw light on the asserted Welsh practice mentioned in a former note.

PHEIDIAS, son of Charmides, universally regarded as the greatest of Greek sculptors, was born at Athens about 500 B.C. We have varying accounts of his training. Hegias of Athens, Ageladas of Argos, and the Thasian painter Polygnotus, have all been regarded as his teachers. In favour of Ageladas it may be said that the influence of the manly Dorian schools is certainly to be traced in some of his work. Of his life we know little apart from his works. Of his death we have two discrepant accounts. According to Plutarch he was made an object of attack by the political enemies of Pericles, and died in prison at Athens. According to Philochorus, as quoted by a scholiast on Aristophanes, he fled to Elis, where he made the great statue of Zeus for the Eleans, and was afterwards put to death by them. For several reasons the first of these tales is preferable.

Plutarch gives in his life of Pericles a charming account of the vast artistic activity which went on at Athens while that statesman was in power. He used for the decoration of his own city the money furnished by the Athenian allies for defence against Persia: it is very fortunate that after the time of Xerxes Persia made no deliberate attempt against Greece. "In all these works," says Plutarch, "Pheidias was the adviser and overseer of Pericles." Pheidias introduced his own portrait and that of Pericles on the shield of his Parthenos statue. And it was through Pheidias that the political enemies of Pericles struck at him. It thus abundantly appears that Pheidias was closely connected with Pericles, and a ruling spirit in the Athenian art of the period. But it is not easy to go beyond this general assertion into details.

It is important to observe that in resting the fame of Pheidias upon the sculptures of the Parthenon we proceed with little evidence. No ancient writer ascribes them to him, and he seldom, if ever, executed works in marble. What he was celebrated

for in antiquity was his statues in bronze or gold and ivory. If Plutarch tells us that he superintended the great works of Pericles on the Acropolis, this phrase is very vague. On the other hand, inscriptions prove that the marble blocks intended for the pedimental statues of the Parthenon were not brought to Athens until 434 B.C., which was probably after the death of Pheidias. And there is a marked contrast in style between these statues and the certain works of Pheidias. It is therefore probable that most if not all of the sculptural decoration of the Parthenon was the work of pupils of Pheidias, such as Alcamenes and Agoracritus, rather than his own.

The earliest of the great works of Pheidias were dedications in memory of Marathon, from the spoils of the victory. At Delphi he erected a great group in bronze including the figures of Apollo and Athena, several Attic heroes, and Miltiades the general. On the Acropolis of Athens he set up a colossal bronze image of Athena, which was visible far out at sea. At Pellene in Achaea, and at Plataea he made two other statues of Athena, also a statue of Aphrodite in ivory and gold for the people of Elis. But among the Greeks themselves the two works of Pheidias which far outshone all others, and were the basis of his fame, were the colossal figures in gold and ivory of Zeus at Olympia and of Athena Parthenos at Athens, both of which belong to about the middle of the 5th century. Of the Zeus we have unfortunately lost all trace save small copies on coins of Elis, which give us but a general notion of the pose, and the character of the head. The god was seated on a throne, every part of which was used as a ground for sculptural decoration. His body was of ivory, his robe of gold. His head was of somewhat archaic type: the Otricoli mask which used to be regarded as a copy of the head of the Olympian statue is certainly more than a century later in style. Of the Athena Parthenos two small copies in marble have been found at Athens (see GREEK ART, fig. 38) which have no excellence of workmanship, but have a certain evidential value as to the treatment of their original.

It will be seen how very small is our actual knowledge of the works of Pheidias. There are many stately figures in the Roman and other museums which clearly belong to the same school as the Parthenos; but they are copies of the Roman age, and not to be trusted in point of style. A. Furtwängler proposes to find in a statue of which the head is at Bologna, and the body at Dresden, a copy of the Lemnian Athena of Pheidias; but his arguments (*Masterpieces*, at the beginning) are anything but conclusive. Much more satisfactory as evidence are some 5th century torsos of Athena found at Athens. The very fine torso of Athena in the École des Beaux Arts at Paris, which has unfortunately lost its head, may perhaps best serve to help our imagination in reconstructing a Pheidian original.

As regards the decorative sculptures of the Parthenon, which the Greeks rated far below their colossus in ivory and gold, see the article PARTHENON.

Ancient critics take a very high view of the merits of Pheidias. What they especially praise is the ethos or permanent moral level of his works as compared with those of the later "pathetic" school. Demetrius calls his statues sublime, and at the same time precise. That he rode on the crest of a splendid wave of art is not to be questioned: but it is to be regretted that we have no morsel of work extant for which we can definitely hold him responsible. (P. G.)

PHEIDON (8th or 7th century B.C.), king of Argos, generally, though wrongly, called "tyrant." According to tradition he flourished during the first half of the 8th century B.C. He was a vigorous and energetic ruler and greatly increased the power of Argos. He gradually regained sway over the various cities of the Argive confederacy, the members of which had become practically independent, and (in the words of Ephorus) "reunited the broken fragments of the inheritance of Temenus." His object was to secure predominance for Argos in the north of Peloponnesus. According to Plutarch, he attempted to break the power of Corinth, by requesting the Corinthians to send him 1000 of their picked youths, ostensibly to aid him in war, his real intention being to put them to death; but the plot was revealed. Pheidon assisted the Pisatans to expel the Elean superintendents of the Olympian games and presided at the festival himself. The Eleans, however, refused to recognize the Olympiad or to include it in the register, and shortly afterwards, with the aid of the Spartans, who are said to have looked upon Pheidon as having ousted them from the headship of Greece, defeated Pheidon and were reinstated in the possession of Pisatis and their former privileges. Pheidon is said to have lost his life in a faction fight at Corinth, where the monarchy had recently been overthrown. The affair of the games has an important bearing on his date. Pausanias (vi. 22, 2) definitely states that Pheidon presided at the festival in the 8th Olympiad (*i.e.* in 748 B.C.), but in the list of the suitors of Agariste, daughter of Cleisthenes of Sicyon, given by Herodotus, there occurs the name of Leocedes (Lacedas), son of Pheidon of Argos. According to this, Pheidon must have flourished during the early part of the 6th century. It has therefore been assumed that Herodotus confused two Pheidons, both kings of Argos. The suggested substitution in the text of Pausanias of the 28th for the 8th Olympiad (*i.e.* 668 instead of 748) would not bring it into agreement with Herodotus, for even then Pheidon's son could not have been a suitor in 570 for the hand of Agariste. But the story of Agariste's wooing resembles romance and has slight chronological value. On the whole, modern authorities assign Pheidon to the first half of the 7th century. Herodotus further states that Pheidon established a system of weights and measures throughout Peloponnesus, to which Ephorus and the Parian Chronicle add that he was the first to coin silver money, and that his mint was at Aegina. But according to the better authority of Herodotus (i. 94) and Xenophanes of Colophon, the Lydians were the first coiners of money at the beginning of the 7th century, and, further, the oldest known Aeginetan coins are of later date than Pheidon. Hence, unless a later Pheidon is assumed, the statement of Ephorus must be considered unhistorical. No such difficulty occurs in regard to the weights and measures; it is generally agreed that a system was already in existence in the time of Pheidon, into which he introduced certain changes. A passage in the Aristotelian *Constitution of Athens* (x. 2) states that the measures used before the Solonian period of reform were called "Pheidonian."

See Herodotus vi. 127; Ephorus in Strabo viii. 358, 376; Plutarch, *Amatoriae narrationes*, 2; Marmor parium, *ep.* 30; Pollux ix. 83; Nicolaus Damascenus, frag. 41 (in C. W. Muller's *Frag. hist. graecorum*, iii.); G. Grote, *History of Greece*, pt. ii. ch. 4; B. V. Head, *Historia Numorum* (1887); F. Hultsch, *Griechische und römische Metrologie* (1882); G. Rawlinson's *Herodotus*, appendix, bk. i., note 8. On the question of Pheidon's date, see J. B. Bury, *History of Greece*, ii. 468 (1902); J. P. Mahaffy, *Problems in Greek History*, ch. 3 (1892); J. G. Frazer's note on Pausanias vi. 22, 2; and especially G. Busolt, *Griechische Geschichte* (2nd ed., 1893), ch. iii. 12. C. Trieber, *Pheidon von Argos* (Hanover, 1880), and J. Beloch, in *Rheinisches Museum*, xlv. 595 (1890), favour a later date, about 580.

PHELPS, AUSTIN (1820–1890), American Congregational minister and educationist, was born on the 7th of January 1820 at West Brookfield, Massachusetts, son of Eliakim Phelps,[1] a clergyman, who, during the boyhood of his son was principal of a girls' school in Pittsfield, Massachusetts, and later pastor of a Presbyterian church in Geneva, New York. The son studied at Hobart College in 1833–1835, then at Amherst for a year, and in 1837 graduated at the university of Pennsylvania. He studied theology at Union Theological Seminary, at the Yale Divinity School, and at Andover, and was licensed to preach in 1840 by the Third Presbytery of Philadelphia. He was pastor of the Pine Street (Congregational) Church in Boston in 1842–1848, and in 1848–1879 was professor of sacred rhetoric and homiletics at Andover Theological Seminary, of which he was president from 1869 to 1879, when his failing health forced him to resign. He died on the 13th of October 1890 at Bar Harbor, Maine. His *Theory of Preaching* (1881) and *English*

[1] Eliakim Phelps afterwards lived in Stratford, Herkimer county, New York, where his house was "possessed" and was long a place of curious interest to students of "spiritualism."

Style in Public Discourse (1883) became standard textbooks; and personally he was a brilliant preacher. He married in 1842 Elizabeth Stuart (1815–1852), eldest daughter of Moses Stuart, then president of Andover; she was the author of the popular story *Sunnyside* (1851) and of other books. In 1854 he married her sister, who died only eighteen months later; and in 1858 he married Mary A. Johnson, of Boston.

With Professors E. A. Park and D. L. Furber he edited *Hymns and Choirs* (1860), and with Professor Park and Lowell Mason *The Sabbath Hymn Book* (1859). *The Still Hour* (1859), a summary of a series of sermons on prayer, is a devotional classic. His other works are: *The New Birth* (1867), portraying conversion (in some instances) as a gradual change; *Sabbath Hours* (1874); *Studies of the Old Testament* (1878); *Men and Books* (1882); *My Portfolio* (1882); *My Study* (1885); and *My Note Book* (1890).

See *Austin Phelps: A Memoir* (New York, 1891), by his daughter, Elizabeth Stuart Phelps-Ward.

PHELPS, EDWARD JOHN (1822–1900), American lawyer and diplomat, was born on the 11th of July 1822 at Middlebury, Vermont. He graduated from Middlebury College in 1840, was a schoolmaster for a year in Virginia, and was admitted to the bar in 1843. He began practice at Middlebury, but in 1845 removed to Burlington, Vermont. From 1851 to 1853 he was second comptroller of the United States Treasury, and then practised law in New York City until 1857, when he returned to Burlington. Becoming a Democrat after the Whig party had ceased to exist, he was debarred from a political career in his own state, where his party was in the minority, but he served in the state constitutional convention in 1870, and in 1880 was the Democratic candidate for governor of his state. He was one of the founders of the American Bar Association, and was its president in 1880–1881. From 1881 until his death he was Kent Professor of Law in Yale University. He was minister to Great Britain from 1885 to 1889, and in 1893 served as senior counsel for the United States before the international tribunal at Paris to adjust the Bering Sea controversy. His closing argument, requiring eleven days for its delivery, was an exhaustive review of the case. Phelps lectured on medical jurisprudence at the university of Vermont in 1881–1883, and on constitutional law at Boston University in 1882–1883, and delivered numerous addresses, among them that on "The United States Supreme Court and the Sovereignty of the People" at the centennial celebration of the Federal Judiciary in 1890 and an oration at the dedication of the Bennington Battle Monument, unveiled in 1891 at the centennial of Vermont's admission to the Union. In politics Phelps was always Conservative, opposing the anti-slavery movement before 1860, the free-silver movement in 1896, when he supported the Republican presidential ticket, and after 1898 becoming an ardent "anti-expansionist." He died at New Haven, Connecticut, on the 9th of March 1900.

See the *Orations and Essays of Edward John Phelps*, edited by J. G. McCullough, with a *Memoir* by John W. Stewart (New York, 1901); and "Life and Public Services of the Hon. Edward J. Phelps," by Matthew H. Buckham, in *Proceedings* of the Vermont Historical Society (Burlington, Vt., 1901).

PHELPS, SAMUEL (1804–1878), English actor and manager, was born at Devonport on the 13th of February 1804. He was early thrown upon his own resources, and worked in various newspaper offices. Shortly after his marriage in 1826 to Sarah Cooper (d. 1867), he accepted a theatrical engagement in the York circuit at eighteen shillings a week, and afterwards appeared in south of England towns in prominent tragic rôles, attracting sufficient attention to be spoken of as a rival to Kean. He made his first London appearance on the 28th of August 1837 as Shylock at the Haymarket. After a short season there he was with Macready for about six years at Covent Garden, the Haymarket and Drury Lane successively. In 1844 he became co-lessee of Sadler's Wells Theatre with Thomas L. Greenwood and Mrs Mary Amelia Warner (1804–1854). Greenwood supplied the business capacity, Phelps was the theatrical manager, and Mrs Warner leading lady. In this position Phelps remained for twenty years, during which time he raised the Sadler's Wells house to an important position, and himself appeared in a very extensive and varied repertory. Thirty-four of Shakespeare's plays were presented there under his direction, with great educational effect, both on public and players. In 1861 Greenwood retired from the partnership, and Phelps, unable to cope with the business of management, retired from it in the following year. For the next fifteen years he acted under various managements, achieving considerable success in some of Halliday's dramatic versions of Scott's novels, such as *The Fortunes of Nigel* and *Ivanhoe*. His last appearance was in 1878 as Wolsey in *Henry VIII.*, and he died on the 6th of November 1878. He was a sound and capable actor, rather than one of any marked genius; and, in spite of his predilection for tragedy, was most successful in such characters of comedy as called for dry humour. Perhaps Sir Pertinax MacSycophant in Charles Macklin's *The Man of the World* was his finest impersonation. He published an annotated edition of Shakespeare's plays (2 vols., 1852–1854).

PHELYPEAUX, a French family of Blésois. Its two principal branches were those of the seigneurs of Herbault, La Vrillière and Saint Florentin, and of the counts of Pontchartrain and Maurepas. Raimond Phelypeaux, seigneur of Herbault and La Vrillière (d. 1629), was treasurer of the *Epargne* in 1599, and became secretary of state in 1621. His son Louis succeeded him in this latter office, and died in 1681. Balthazar Phelypeaux, marquis de Châteauneuf (d. 1700), and Louis, marquis de La Vrillière (d. 1725), respectively son and grandson of Louis, were also secretaries of state. Louis Phelypeaux (1705–1777), count of Saint Florentin and afterwards duke of La Vrillière (1770), succeeded his father as secretary of state; became minister of the king's household in 1749, a minister of state in 1751, and discharged the functions of minister of foreign affairs on the disgrace of Choiseul (1770). He incurred great unpopularity by his abuse of *lettres de cachet*, and had to resign in 1775. Raimond Balthazar Phelypeaux, seigneur du Verger, a member of the La Vrillière branch, was sent as ambassador to Savoy in 1700, where he discovered the intrigues of the duke of Savoy, Victor Amadeus II., against France; and when war was declared he was kept a close prisoner by the duke (1703–1704). At the time of his death (1713) he was governor-general in the West Indies. The branch of Pontchartrain-Maurepas was founded by Paul Phelypeaux (1569–1621), brother of the first-mentioned Raimond; he became secretary of state in 1610.

PHENACETIN, $C_2H_5O{\cdot}C_6H_4{\cdot}NHCOCH_3$ (para-acetaminophenetol), a drug prepared by acetylating para-phenetidin, or by heating para-acetylaminophenol and potassium ethyl sulphate with alcoholic soda to 150° C. Para-phenetidin is prepared by treating the sodium salt of para-nitrophenol with ethyl iodide, and reducing the nitrophenetol to para-phenetidin or aminophenetol. The yield may be doubled by diazotizing para-phenetidin, coupling with phenol, ethylating and reducing:

$$EtO{\cdot}C_6H_4{\cdot}NH_2 \rightarrow EtO{\cdot}C_6H_4{\cdot}N_2OH \rightarrow EtO{\cdot}C_6H_4{\cdot}N_2{\cdot}C_6H_4{\cdot}OH \rightarrow EtO{\cdot}C_6H_4{\cdot}N_2{\cdot}C_6H_4{\cdot}OEt \rightarrow 2EtO{\cdot}C_6H_4{\cdot}NH_2.$$

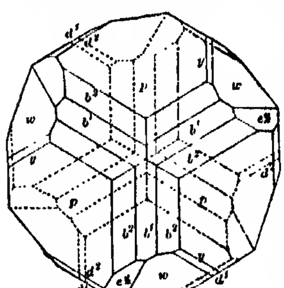
It crystallizes from water in colourless plates, melting at 135° C. It is soluble in about 70 parts of hot and in about 1400 parts of cold water.

Several compounds related to phenacetin have been introduced into medicine. Triphenin is propylphenetidin; lactophenin is lactylphenetidin; pyrantin is para-ethoxyphenyl succinimide, $EtO{\cdot}C_6H_4{\cdot}N[CO{\cdot}CH_2]_2$; salophen or saliphenin is salicylphenetidin; amygdophenin is mandelylphenetidin. In addition, several other derivatives have been suggested which have a greater solubility than phenacetin, *e.g.* phesin, which is the sodium salt of phenacetin sulphonic acid, apolysin and citrophen (citrophenin), which are citric acid derivatives of para-phenetidin, &c.

Phenacetin is contained in both the British and United States pharmacopoeia, in the latter under the name of acetphenetidin. The dose is 5 to 10 grs. given in cachets or in suspension. When the drug is carelessly made it may contain impurities, producing considerable irritation of the kidneys. The physiological action of phenacetin consists in a sedative action on the sensory tracts of the spinal cord, and a depressant action on the heart, where it

tends to paralyse the action of the cardiac muscle. Upon the bodily heat it exercises a marked effect, decreasing the action of the heat-producing centre as well as increasing the dissipation of heat, and thus causing a marked fall in temperature. In toxic doses the blood becomes dark and blackish from the formation of methaemoglobin, and the urine is changed in colour from the passage of altered blood. The chief therapeutic use of phenacetin is as an antineuralgic, and it is of service in migraine, rheumatism of the sub-acute type, intercostal neuralgia and locomotor ataxia.

PHENACITE, a mineral consisting of beryllium orthosilicate, Be_2SiO_4, occasionally used as a gem-stone. It occurs as isolated crystals, which are rhombohedral with parallel-faced hemihedrism, and are either lenticular or prismatic in habit: the lenticular habit is determined by the development of faces of several obtuse rhombohedra and the absence of prism faces (the accompanying figure is a plan of such a crystal viewed along the triad, or principal, axis). There is no cleavage, and the fracture is conchoidal. The hardness is high, being $7\frac{1}{2}-8$; the specific gravity is 2·98. The crystals are sometimes perfectly colourless and transparent, but more often they are greyish or yellowish and only translucent; occasionally they are pale rose-red. In general appearance the mineral is not unlike quartz, for which indeed it had been mistaken; on this account it was named, by N. Nordenskiöld in 1833, from Gr. φέναξ (a deceiver).



Phenacite has long been known from the emerald and chrysoberyl mine on the Takovaya stream, near Ekaterinburg in the Urals, where large crystals occur in mica-schist. It is also found with topaz and amazon-stone in the granite of the Ilmen mountains in the southern Urals and of the Pike's Peak region in Colorado. Large crystals of prismatic habit have more recently been found in a feldspar quarry at Kragerö in Norway. Framont near Schirmeck in Alsace is another well-known locality. Still larger crystals, measuring 12 in. in diameter and weighing 28 ℔, have been found at Greenwood in Maine, but these are pseudomorphs of quartz after phenacite.

For gem purposes the stone is cut in the brilliant form, of which there are two fine examples, weighing 43 and 34 carats, in the British Museum. The indices of refraction ($\omega=1{\cdot}6540$, $\epsilon=1{\cdot}6527$) are higher than those of quartz, beryl or topaz; a faceted phenacite is consequently rather brilliant and may sometimes be mistaken for diamond. (L. J. S.)

PHENACODUS, one of the earliest and most primitive of the ungulate mammals, typifying the family *Phenacodontidae* and the sub-order Condylarthra. The typical *Phenacodus primaevus*, of the Lower or Wasatch Eocene of North America, was a relatively small ungulate, of slight build, with straight limbs each terminating in five complete toes, and walking in the digitigrade fashion of the modern tapir. The middle toe was the largest, and the weight of the body was mainly supported on this and the two adjoining digits, which appear to have been encased in hoofs, thus foreshadowing the tridactyle type common in perissodactyle and certain extinct groups of ungulates. The skull was small, with proportionately minute brain; and the arched back, strong lumbar vertebrae, long and powerful tail, and comparatively feeble fore-quarters all proclaim kinship with the primitive creodont Carnivora (see CREODONTA), from which *Phenacodus* and its allies, and through them the more typical Ungulata, are probably derived. All the bones of the limbs are separate, and those of the carpus and tarsus do not alternate; that is to say, each one in the upper row is placed immediately above the corresponding one in the row below. The full series of forty-four teeth was developed; and the upper molars were short-crowned, or brachyodont, with six low cones, two internal, two intermediate and two external, so that they were of the typical primitive bunodont structure. In habits the animal was cursorial and herbivorous, or possibly carnivorous.

In the Puerco, or Lowest Eocene of North America, the place of the above species was taken by *Euprotogonia puercensis*, an animal only half the size of *Phenacodus primaevus*, with the terminal joints of the limbs intermediate between hoofs and claws, and the first and fifth toes taking their full share in the support of the weight of the body. These two genera may be regarded as forming the earliest stages in the evolution of the horse, coming below *Hyracotherium* (see EQUIDAE).

As ancestors of the Artiodactyle section of the Ungulata, we may look to forms more or less closely related to the North American Lower Eocene genera *Mioclaenus* and *Pantolestes*, respectively typifying the families *Mioclaenidae* and *Pantolestidae*. They were five-toed, bunodont Condylarthra, with a decided approximation to the perissodactyle type in the structure of the feet. A third type of Condylarthra from the North American Lower Eocene is represented by the family *Meniscotheriidae*, including the genera *Meniscotherium* and *Hyracops*. These, it is suggested, may have been related to the ancestral Hyracoidea. Teeth and jaws probably referable to the Condylarthra have been obtained in European early Tertiary formations. All Ungulata probably originated from Condylarthra.

See H. F. Osborn, *Skeleton of Phenacodus primaevus*; comparison with *Euprotogonia*, Bull. Amer. Mus. x. 159. (R. L.*)

PHENANTHRENE, $C_{14}H_{10}$, a hydrocarbon isomeric with anthracene, with which it occurs in the fraction of the coal-tar distillate boiling between 270°–400° C. It may be separated from the anthracene oil by repeated fractional distillation, followed by fractional crystallization from alcohol (anthracene being the less soluble), and finally purified by oxidizing any residual anthracene with potassium bichromate and sulphuric acid (R. Anschutz and G. Schultz, *Ann.*, 1879, 196, p. 35); or the two hydrocarbons may be separated by carbon bisulphide, in which anthracene is insoluble. It is formed when the vapours of toluene, stilbene, dibenzyl, ortho-ditolyl, or coumarone and benzene are passed through a red-hot tube; by distilling morphine with zinc dust; and, with anthracene, by the action of sodium on ortho-brombenzyl bromide (C. L. Jackson and J. F. White, *Amer. Chem. Jour.*, 1880, 2, p. 391). It crystallizes in colourless plates or needles, which melt at 99° C. Its solutions in alcohol and ether have a faint blue fluorescence. When heated to 250° C. with red phosphorus and hydriodic acid it gives a hydride $C_{14}H_{24}$. It is nitrated by nitric acid and sulphonated by sulphuric acid. With picric acid it forms a sparingly soluble picrate, which melts at 145° C. On the condition of phenanthrene in alcoholic solution see R. Behrend, *Zeit. phys. Chem.*, 1892, 9, p. 405; 10, p. 265. Chromic acid oxidizes phenanthrene, first to phenanthrenequinone, and then to diphenic acid, $HO_2C{\cdot}C_6H_4{\cdot}C_6H_4{\cdot}CO_2H$.

Phenanthrene Quinone, $[C_6H_4]_2[CO]_2$, crystallizes in orange needles which melt at 198° C. It possesses the characteristic properties of a diketone, forming crystalline derivatives with sodium bisulphite and a dioxime with hydroxylamine. It is non-volatile in steam, and is odourless. Sulphurous acid reduces it to the corresponding dihydroxy compound. It combines with ortho-diamines, in the presence of acetic acid, to form *phenazines*.

On the constitution of phenanthrene see CHEMISTRY: § *Organic*.

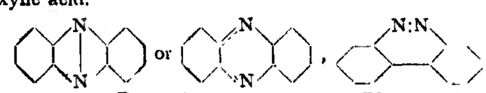
PHENAZINE (Azophenylene), $C_{12}H_8N_2$, in organic chemistry, the parent substance of many dyestuffs, *e.g.* the eurhodines, toluylene red, indulines and safranines. It is a dibenzoparadiazine having the formula given below. It may be obtained by distilling barium azobenzoate (A. Claus, *Ber.*, 1873, 6, p. 723); by passing aniline vapour over lead oxide, or by the oxidation of dihydrophenazine, which is prepared by heating pyrocatechin with orthophenylene diamine (C. Ris, *Ber.*, 1886, 19, p. 2206). It is also formed when ortho-aminodiphenylamine is distilled over lead peroxide (O. Fischer and E. Hepp). It crystallizes in yellow needles which melt at 171° C., and are only sparingly soluble in alcohol. Sulphuric acid dissolves it, forming a deep-red solution. The more complex phenazines, such as the naphthophenazines, naphthazines and naphthotolazines, may be prepared by condensing ortho-diamines with ortho-quinones (O. Hinsberg, *Ann.*, 1887, 237, p. 340); by the oxidation of an ortho-diamine in the presence of α-naphthol (O. Witt), and by

the decomposition of ortho-anilido-(-toluidido- &c.)-azo compounds with dilute acids. If alkyl or aryl-ortho-diamines be used azonium bases are obtained. The azines are mostly yellow in colour, distil unchanged and are stable to oxidants. They add on alkyl iodides readily, forming alkyl azonium salts.

By the entrance of amino or hydroxyl groups into the molecule dyestuffs are formed. The mono-amino derivatives or *eurhodines* are obtained when the arylmonamines are condensed with ortho-aminoazo compounds; by condensing quinone dichlorimide or para-nitrosodimethylaniline with monamines containing a free para position, or by oxidizing ortho-hydroxydiaminodiphenylamines (R. Nietzki, *Ber.*, 1895, 28, p. 2976; O. Fischer, ibid., 1896, 29, p. 1874). They are yellowish-red solids, which behave as weak bases, their salts undergoing hydrolytic dissociation in aqueous solution. When heated with concentrated hydrochloric acid the amino group is replaced by the hydroxyl group and the phenolic eurhodols are produced.

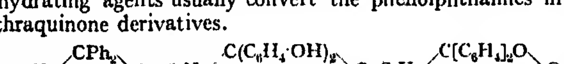
The symmetrical diaminophenazine is the parent substance of the important dyestuff toluylene red or dimethyldiaminotoluphenazine. It is obtained by the oxidation of orthophenylene diamine with ferric chloride; when a mixture of para-aminodimethylaniline and meta-toluylenediamine is oxidized in the cold, toluylene blue, an indamine, being formed as an intermediate product and passing into the red when boiled; and also by the oxidation of dimethyl-paraphenylene diamine with metatoluylene diamine. It crystallizes in orange-red needles and its alcoholic solution fluoresces strongly. It dyes silk and mordanted cotton a fine scarlet. It is known commercially as *neutral red*. For the phenazonium salts see SAFRANINE.

Phenazone is an isomer of phenazine, to which it bears the same relation that phenanthrene bears to anthracene. It is formed by reducing diortho-dinitrodiphenyl with sodium amalgam and methyl alcohol, or by heating diphenylene-ortho-dihydrazine with hydrochloric acid to 150° C. It crystallizes in needles which melt at 156° C. Potassium permanganate oxidizes it to pyridazine tetracarboxylic acid.

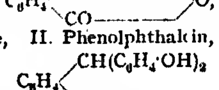


Phenazine. Phenazone.

PHENOLPHTHALEIN, in organic chemistry, a compound derived from phthalophenone, or diphenyl phthalide (formula I.), the anhydride of triphenyl-carbinol-ortho-carboxylic acid, which is obtained by condensing phthalyl chloride with benzene in the presence of aluminium chloride. The phthaleins are formed from this anhydride by the entrance of hydroxyl or amino groups into the two phenyl residues, and are prepared by condensing phenols with phthalic anhydride, phenol itself giving rise to phenolphthalein (formula II.) together with a small quantity of fluorane (formula III.), whilst resorcin under similar conditions yields fluorescein (*q.v.*). The phthaleins on reduction yield phthalines, which are derivatives of triphenylmethane carboxylic acid; these reduction products are colourless and may be regarded as the leuco-compounds of the phthaleins, thus phenolphthalein itself gives phenolphthaline (formula IV.). Dehydrating agents usually convert the phenolphthalines into anthraquinone derivatives.



I. Diphenylphthalide, II. Phenolphthalein, III. Fluorane.



IV. Phenolphthaline.

Phenolphthalein is obtained when phenol and phthalic anhydride are heated with concentrated sulphuric acid. It crystallizes in colourless crusts and is nearly insoluble in water, but dissolves in dilute solutions of the caustic alkalis with a fine red colour, being reprecipitated from these solutions by the addition of mineral acid. It dissolves in concentrated caustic alkalis to a colourless solution which probably contains salts of a non-quinonoid character. This difference in behaviour has led to considerable discussion (see H. Meyer, *Monats.*, 1899, 20, p. 337; R. Meyer, *Ber.*, 1903, 36, p. 2949; A. G. Perkin and Green, *Journ. Chem. Soc.*, 1904, p. 398). On fusion with caustic alkali, phenolphthalein yields benzoic acid and para-dihydroxybenzophenone, which shows that in the original condensation the phthalic acid residue has taken the para position to the hydroxyl groups of the phenol.

Fluorane is a product of the condensation of the phthalic acid residue in the ortho position to the hydroxyl groups of the phenol, anhydride formation also taking place between these hydroxyl groups. It dissolves in concentrated sulphuric acid with a yellowish-green fluorescence. The rhodamines, which are closely related to the phthaleins, are formed by the condensation of the alkyl meta-aminophenols with phthalic anhydride in the presence of sulphuric acid. Their salts are fine red dyes.

PHENOMENON (Gr. φαινόμενον, a thing seen, from φαίνεσθαι, to appear), in ordinary language a thing, process, event, &c., observed by the senses. Thus the rising of the sun, a thunderstorm, an earthquake are natural "phenomena." From this springs the incorrect colloquial sense, something out of the common, an event which especially strikes the attention; hence such phrases as "phenomenal" activity. In Greek philosophy phenomena are the changing objects of the senses as opposed to essences (τὰ ὄντα) which are one and permanent, and are therefore regarded as being more real, the objects of reason rather than of senses which are "bad witnesses." In modern philosophy the phenomenon is neither the "thing-in-itself," nor the noumenon (*q.v.*) or object of pure thought, but the thing-in-itself as it appears to the mind in sensation (see especially KANT and METAPHYSICS). In this sense the subjective character is of prime importance. Among derivative terms are "Phenomenalism" and "Phenomenology." Phenomenalism is either (1) the doctrine that there can be no knowledge except by phenomena, *i.e.* sense-given data, or (2) the doctrine that all known things are phenomena, *i.e.* that there are no "things-in-themselves." "Phenomenology" is the science of phenomena: every special science has a special section in which its particular phenomena are described. The term was first used in English in the 3rd edition of the *Ency. Brit.* in the article "Philosophy" by J. Robison. Kant has a special use of the term for that part of the *Metaphysic of Nature* which considers motion and rest as predicates of a judgment about things.

PHERECRATES, Greek poet of the Old Attic Comedy, was a contemporary of Cratinus, Crates and Aristophanes. At first an actor, he seems to have gained a prize for a play in 438 B.C. The only other ascertained date in his life is 420, when he produced his play *The Wild Men*. Like Crates, whom he imitated, he abandoned personal satire for more general themes, although in some of the fragments of his plays we find him attacking Alcibiades and others. He was especially famed for his inventive imagination, and the elegance and purity of his diction are attested by the epithet ἀττικώτατος (most Attic) applied to him by Athenaeus and the sophist Phrynichus. He was the inventor of a new metre, called after him Pherecratean, which frequently occurs in the choruses of Greek tragedies and in Horace.

A considerable number of fragments from his 16 (or 13) plays has been preserved, collected in T. Kock, *Comicorum Atticorum Fragmenta*, i. (1880), and A. Meineke, *Poetarum Comicorum Graecorum Fragmenta* (1855).

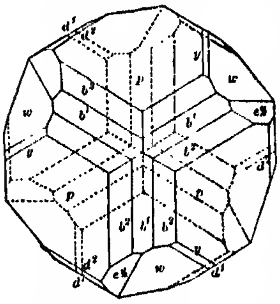
PHERECYDES OF LEROS, Greek mythographer, *fl. c.* 454 B.C. He is probably identical with Pherecydes of Athens, although the two are distinguished by Suïdas (also by I. Lipsius, *Quaestiones logographicae*, 1886). He seems to have been born in the island of Leros, and to have been called an Athenian because he spent the greater part of his life and wrote his great work there. Of his treatises, *On Leros, On Iphigeneia, On the Festivals of Dionysus*, nothing remains; but numerous fragments of his genealogies of the gods and heroes, variously called Ἱστορίαι, Γενεαλογίαι, Αὐτοχθόνες, in ten books, written in the Ionic dialect, have been preserved (see C. W. Müller's *Frag. hist. graec.*, vol. i. pp. xxxiv. 70). He modified the legends, not with a view to rationalizing them, but rather to adjust them to popular beliefs. He cannot, therefore, be classed with Hecataeus, whose method was far more scientific.

See C. Lütke, *Pherecydea* (diss. Göttingen, 1893); W. Christ, *Geschichte der griechischen Litteratur* (1898); and specially H. Bertsch, *Pherekydeische Studien* (1898).

PHERECYDES OF SYROS, Greek philosopher (or rather philosophical theologian), flourished during the 6th century B.C. He was sometimes reckoned one of the Seven Wise Men, and is said to have been the teacher of Pythagoras. With the possible

tends to paralyse the action of the cardiac muscle. Upon the bodily heat it exercises a marked effect, decreasing the action of the heat-producing centre as well as increasing the dissipation of heat, and thus causing a marked fall in temperature. In toxic doses the blood becomes dark and blackish from the formation of methaemoglobin, and the urine is changed in colour from the passage of altered blood. The chief therapeutic use of phenacetin is as an antineuralgic, and it is of service in migraine, rheumatism of the sub-acute type, intercostal neuralgia and locomotor ataxia.

PHENACITE, a mineral consisting of beryllium orthosilicate, Be_2SiO_4, occasionally used as a gem-stone. It occurs as isolated crystals, which are rhombohedral with parallel-faced hemihedrism, and are either lenticular or prismatic in habit: the lenticular habit is determined by the development of faces of several obtuse rhombohedra and the absence of prism faces (the accompanying figure is a plan of such a crystal viewed along the triad, or principal, axis). There is no cleavage, and the fracture is conchoidal. The hardness is high, being $7\frac{1}{2}-8$; the specific gravity is 2·98. The crystals are sometimes perfectly colourless and transparent, but more often they are greyish or yellowish and only translucent; occasionally they are pale rose-red. In general appearance the mineral is not unlike quartz, for which indeed it had been mistaken; on this account it was named, by N. Nordenskiöld in 1833, from Gr. φέναξ (a deceiver).



Phenacite has long been known from the emerald and chrysoberyl mine on the Takovaya stream, near Ekaterinburg in the Urals, where large crystals occur in mica-schist. It is also found with topaz and amazon-stone in the granite of the Ilmen mountains in the southern Urals and of the Pike's Peak region in Colorado. Large crystals of prismatic habit have more recently been found in a feldspar quarry at Kragerö in Norway. Framont near Schirmeck in Alsace is another well-known locality. Still larger crystals, measuring 12 in. in diameter and weighing 28 lb, have been found at Greenwood in Maine, but these are pseudomorphs of quartz after phenacite.

For gem purposes the stone is cut in the brilliant form, of which there are two fine examples, weighing 43 and 34 carats, in the British Museum. The indices of refraction ($\omega = 1·6540$, $\epsilon = 1·6527$) are higher than those of quartz, beryl or topaz; a faceted phenacite is consequently rather brilliant and may sometimes be mistaken for diamond. (L. J. S.)

PHENACODUS, one of the earliest and most primitive of the ungulate mammals, typifying the family *Phenacodontidae* and the sub-order Condylarthra. The typical *Phenacodus primaevus*, of the Lower or Wasatch Eocene of North America, was a relatively small ungulate, of slight build, with straight limbs each terminating in five complete toes, and walking in the digitigrade fashion of the modern tapir. The middle toe was the largest, and the weight of the body was mainly supported on this and the two adjoining digits, which appear to have been encased in hoofs, thus foreshadowing the tridactyle type common in perissodactyle and certain extinct groups of ungulates. The skull was small, with proportionately minute brain; and the arched back, strong lumbar vertebrae, long and powerful tail, and comparatively feeble fore-quarters all proclaim kinship with the primitive creodont Carnivora (see CREODONTA), from which *Phenacodus* and its allies, and through them the more typical Ungulata, are probably derived. All the bones of the limbs are separate, and those of the carpus and tarsus do not alternate; that is to say, each one in the upper row is placed immediately above the corresponding one in the row below. The full series of forty-four teeth was developed; and the upper molars were short-crowned, or brachyodont, with six low cones, two internal, two intermediate and two external, so that they were of the typical primitive bunodont structure. In habits the animal was cursorial and herbivorous, or possibly carnivorous.

In the Puerco, or Lowest Eocene of North America, the place of the above species was taken by *Euprotogonia puercensis*, an animal only half the size of *Phenacodus primaevus*, with the terminal joints of the limbs intermediate between hoofs and claws, and the first and fifth toes taking their full share in the support of the weight of the body. These two genera may be regarded as forming the earliest stages in the evolution of the horse, coming below *Hyracotherium* (see EQUIDAE).

As ancestors of the Artiodactyle section of the Ungulata, we may look to forms more or less closely related to the North American Lower Eocene genera *Mioclaenus* and *Pantolestes*, respectively typifying the families *Mioclaenidae* and *Pantolestidae*. They were five-toed, bunodont Condylarthra, with a decided approximation to the perissodactyle type in the structure of the feet. A third type of Condylarthra from the North American Lower Eocene is represented by the family *Meniscotheriidae*, including the genera *Meniscotherium* and *Hyracops*. These, it is suggested, may have been related to the ancestral Hyracoidea. Teeth and jaws probably referable to the Condylarthra have been obtained in European early Tertiary formations. All Ungulata probably originated from Condylarthra.

See H. F. Osborn, *Skeleton of Phenacodus primaevus*; comparison with *Euprotogonia*, Bull. Amer. Mus. x. 159. (R. L.*)

PHENANTHRENE, $C_{14}H_{10}$, a hydrocarbon isomeric with anthracene, with which it occurs in the fraction of the coal-tar distillate boiling between 270°–400° C. It may be separated from the anthracene oil by repeated fractional distillation, followed by fractional crystallization from alcohol (anthracene being the less soluble), and finally purified by oxidizing any residual anthracene with potassium bichromate and sulphuric acid (R. Anschutz and G. Schultz, *Ann.*, 1879, 196, p. 35); or the two hydrocarbons may be separated by carbon bisulphide, in which anthracene is insoluble. It is formed when the vapours of toluene, stilbene, dibenzyl, ortho-ditolyl, or coumarone and benzene are passed through a red-hot tube; by distilling morphine with zinc dust; and, with anthracene, by the action of sodium on ortho-brombenzyl bromide (C. L. Jackson and J. F. White, *Amer. Chem. Jour.*, 1880, 2, p. 391). It crystallizes in colourless plates or needles, which melt at 99° C. Its solutions in alcohol and ether have a faint blue fluorescence. When heated to 250° C. with red phosphorus and hydriodic acid it gives a hydride $C_{14}H_{24}$. It is nitrated by nitric acid and sulphonated by sulphuric acid. With picric acid it forms a sparingly soluble picrate, which melts at 145° C. On the condition of phenanthrene in alcoholic solution see R. Behrend, *Zeit. phys. Chem.*, 1892, 9, p. 405; 10, p. 265. Chromic acid oxidizes phenanthrene, first to phenanthrenequinone, and then to diphenic acid, $HO_2C{\cdot}C_6H_4{\cdot}C_6H_4{\cdot}CO_2H$.

Phenanthrene Quinone, $[C_6H_4]_2[CO]_2$, crystallizes in orange needles which melt at 198° C. It possesses the characteristic properties of a diketone, forming crystalline derivatives with sodium bisulphite and a dioxime with hydroxylamine. It is non-volatile in steam, and is odourless. Sulphurous acid reduces it to the corresponding dihydroxy compound. It combines with ortho-diamines, in the presence of acetic acid, to form *phenazines*.

On the constitution of phenanthrene see CHEMISTRY: § *Organic*.

PHENAZINE (Azophenylene), $C_{12}H_8N_2$, in organic chemistry, the parent substance of many dyestuffs, *e.g.* the eurhodines, toluylene red, indulines and safranines. It is a dibenzoparadiazine having the formula given below. It may be obtained by distilling barium azobenzoate (A. Claus, *Ber.*, 1873, 6, p. 723); by passing aniline vapour over lead oxide, or by the oxidation of dihydrophenazine, which is prepared by heating pyrocatechin with orthophenylene diamine (C. Ris, *Ber.*, 1886, 19, p. 2206). It is also formed when ortho-aminodiphenylamine is distilled over lead peroxide (O. Fischer and E. Hepp). It crystallizes in yellow needles which melt at 171° C., and are only sparingly soluble in alcohol. Sulphuric acid dissolves it, forming a deep-red solution. The more complex phenazines, such as the naphthophenazines, naphthazines and naphthotolazines, may be prepared by condensing ortho-diamines with ortho-quinones (O. Hinsberg, *Ann.*, 1887, 237, p. 340); by the oxidation of an ortho-diamine in the presence of α-naphthol (O. Witt), and by

two favourite subjects in Greek plastic art of the best period. They are designed with wonderful fertility of invention, and life-like realism and spirit; the composition is arranged so as to form a series of diagonal lines or zigzags *NV*, thus forming a pleasing contrast to the unbroken horizontal lines of the cornice and architrave. The various groups are skilfully united together by some dominant line or action, so that the whole subject forms one unbroken composition.

The relief is very high, more than 3½ in. in the most salient parts, and the whole treatment is quite opposite to that of the Parthenon frieze, which is a very superior work of art to that at Bassae. Many of the limbs are quite detached from the ground; the drill has been largely used to emphasize certain shadows, and in many places, for want of due calculation, the sculptor has had to cut into the flat background behind the figures. From this it would appear that no finished clay-model was prepared, but that the relief was sculptured with only the help of a drawing. The point of sight, more than 20 ft. below the bottom of the frieze, and the direction in which the light fell on it have evidently been carefully considered. Many parts, invisible from below, are left comparatively rough. The workmanship throughout is unequal, and the hands of several sculptors can be detected. On the whole, the execution is not equal to the beauty of the design, and the whole frieze is somewhat marred by an evident desire to produce the maximum of effect with the least possible amount of labour—very different from the almost gem-like finish of the Parthenon frieze. Even the design is inferior to the Athenian one; most of the figures are ungracefully short in their proportions, and there is a great want of refined beauty in many of the female hands and faces. It is in the fire of its varied action and its subtlety of expression that this sculpture most excels. The noble movements of the heroic Greeks form a striking contrast to the feminine weakness of the wounded Amazons, or the struggles with teeth and hoofs of the brutish Centaurs; the group of Apollo and Artemis in their chariot is full of grace and dignified power. The marble in which this frieze is sculptured is somewhat coarse and crystalline; the slabs appear not to have been built into their place but fixed afterwards, with the aid of two bronze bolts driven through the face of each.

Of the metopes, which were 2 ft. 8 in. square, only one exists nearly complete, with eleven fragments; the one almost perfect has a relief of a nude warrior, with floating drapery, overcoming a long-haired bearded man, who sinks vanquished at his feet. The relief of these is rather less than that of the frieze figures, and the work is nobler in character and superior in execution.

In addition to the works mentioned in the text, see Leake, *Morea* (i. 490 and ii. 319; Curtius, *Peloponnesos*, i. 319; Ross, *Reisen in Peloponnesos*; Stackelberg, *Der Apollo-Tempel zu Bassae* (1826); Lenormant, *Bas-reliefs du Parthenon et de Phigalie* (1834); and Histories of Sculpture mentioned under GREEK ART.

(J. H. M.; E. GR.)

PHILADELPHIA, the Greek name (1) of a city in Palestine in the land of Ammon (see AMMONITES), and (2) of a city so-called in honour of Attalus II. of Pergamum, the modern Ala-Shehr (*q.v.*).

PHILADELPHIA, the third city in population in the United States, the chief city of Pennsylvania, and a port of entry, co-extensive with Philadelphia county, extending W. from the Delaware River beyond the Schuylkill River, and from below the confluence of the Delaware and Schuylkill rivers N.E. about 23 m. along the Delaware River and Poquessing Creek. Independence Hall, which is a few squares east by south of the city hall, is in 39° 56′ 57·5″ N. and 75° 8′ 54·75″ W. The port is about 102 m. from the Atlantic Ocean, and the city-hall is 90 m. by rail S.S.W. of New York and 135 m. N.E. of Washington. The city has an area of 132·7 sq. m. At the southern extremity are lowlands protected by dikes from the tide; the business centre between the rivers is about 40 ft. higher but level; the district west of the Schuylkill is generally rolling; and in the upper district the surface rises from the Delaware toward the north-west until in the extreme north-west is a picturesque district overlooking Wissahickon Creek from hills exceeding 400 ft. in height.

Population.—When the first United States census was taken, in 1790, Philadelphia was the second largest city in the Union, and had a population of 28,522. It held this rank until 1830, when it was exceeded in size by Baltimore as well as by New York. In 1850 it was smaller also than Boston; but in 1854 the Consolidation Act extended its boundaries so as to include all Philadelphia county and in 1860 the city had risen again to second rank. This rank it held until 1890 when, although its population had grown to 1,046,964, it was 50,000 less than that of Chicago. In 1900, with a population of 1,293,679, it was still farther behind both New York and Chicago. In 1900, of the total population, 998,357, or 77·18%, were native-born, as against only 63% native-born in New York and 65·43% native-born in Chicago. Of Philadelphia's native-born white population, however, 414,093, or 44·24%, were of foreign-born parentage. The foreign-born population included 98,427 born in Ireland, 71,319 born in Germany, 36,752 born in England, 28,951 born in Russia (largely Hebrews), 17,830 born in Italy, 8479 born in Scotland and 5154 born in Austria; and the coloured consisted of 62,613 negroes, 1165 Chinese, 234 Indians and 12 Japanese. In 1910 the population was 1,549,008.

Streets.—With the exception of a limited number of diagonal thoroughfares and of streets laid out in outlying districts in conformity with the natural contour of the ground the plan of the city is regular. Market Street—which Penn called High Street—is the principal thoroughfare east and west, Broad Street the principal thoroughfare north and south, and these streets intersect at right angles at City Hall Square in the business centre. The streets parallel with Broad are numbered from First or Front Street west from the Delaware River to Sixty-third Street, taking the prefix "North" north of Market Street and the prefix "South" south of it; the streets parallel with Market are named mostly from trees and from the governors and counties of Pennsylvania.

The wholesale district is centred at the east end of Market Street near the Delaware River. The best retail shops are farther west on the south side of Chestnut Street and on Market and Arch streets. Most of the leading banks and trust companies are on Chestnut Street and on Third Street between Chestnut and Walnut streets. Several of the larger office buildings and the stations of the Pennsylvania and the Philadelphia & Reading railways are in the vicinity of the city-hall; here too, are the Baldwin Locomotive Works. The large textile mills, the great coal wharves and the Cramp Ship-yards are to the north-east along the Delaware, and in districts west of these are the leading manufactories of iron and steel. There are large sugar refineries in the south-eastern part of the city. Rittenhouse Square, a short distance south-west of the city-hall, is the centre of the old aristocratic residential district, and the south side of Walnut Street between Fourteenth and Nineteenth streets is a fashionable parade. There are fine residences on North Broad Street and on some of the streets crossing it, and many beautiful villas in the picturesque suburbs of the north-west. The most congested tenements, occupied largely by Italians, Hebrews and negroes, are along the alleys between the rivers and south of Market Street, often in the rear of some of the best of the older residences.

The principal structure is the city-hall (or "Public Buildings") one of the largest buildings in the world in ground space (4½ acres). It rises 548 ft. to the top of a colossal bronze statue (37 ft. high) of William Penn (by Alexander Calder) surmounting the tower. It accommodates the state and county courts as well as the municipal and county offices. The foundation stone was laid in August 1872. On its first floor is Joseph A. Bailly's statue of Washington, which was erected in front of Independence Hall in 1869. About the Public Buildings are statues of Generals McClellan and Reynolds, President McKinley, and Joseph Leidy and St Gaudens's "Pilgrim." On all sides are great buildings: on the north the masonic temple (1868–1873); on the south the stately Betz Building; on the west the enormous Broad Street station of the Pennsylvania railway. The Pennsylvania Academy of Fine Arts and the Oddfellows' Temple are among other notable buildings in the vicinity. The post office, facing Ninth Street and extending from Market Street to Chestnut Street, was opened in 1884; in front is a seated statue of Benjamin Franklin, by John J. Boyle. The mint is at the corner of Sixteenth and Spring Garden streets. The custom-house, on Chestnut Street, was designed by William Strickland (1787–1854), in his day the leading American architect. It was modelled after the Parthenon of Athens, was built for the Second United States Bank, was completed in 1824, and was put to its present use in 1845. Other prominent buildings of

which Strickland was the architect are the Stock Exchange, St Paul's Protestant Episcopal Church, St Stephen's Church, the Almshouse and the United States Naval Asylum. The main building of Girard College (on Girard Avenue, between North 19th and North 25th streets), of which Thomas Ustick Walter (1804–1887), a pupil of Strickland's, was the architect, is one of the finest specimens of pure Greek architecture in America. Near the Schuylkill River, in West Philadelphia, are the buildings of the university of Pennsylvania. Its free museum of science and art, at South 23rd and Spruce, on the opposite side of the river, was built from the designs of Walter Cope, Frank Miles Day and Wilson Eyre, and its north-western part was first opened in 1899. Tall steel-frame structures, of which the Betz Building, completed in 1893, was the first, have become numerous. The Roman Catholic Cathedral of St Peter and St Paul, east of Logan Square, was begun in 1846 and was eighteen years in building. The Arch Street Methodist Episcopal Church is one of the most handsome churches in the city. The South Memorial Church of the Advocate (1897), on North 18th and Diamond streets, is a reproduction on a smaller scale of Amiens Cathedral.

Perhaps the most famous historical monument in the United States is Independence Hall, on Chestnut Street between Fifth and Sixth streets, designed for the state house by Andrew Hamilton (*c.* 1676–1741), speaker of the assembly, and was used for that purpose until 1799. The foundations were laid in 1731 and the main building was ready for occupancy in 1735, although the entire building was not completed until 1751. The steeple was taken down in 1774 but was restored by Strickland in 1828, and further restorations of the buildings to its original condition were effected later. In the east room on the first floor of this building the second continental congress met on the 10th of May 1775; George Washington was chosen commander-in-chief of the continental army on the 15th of June 1775, and the Declaration of Independence was adopted on the 4th of July 1776. The room contains much of the furniture of those days, and on its walls are portraits of forty-five of the fifty-six signers of the Declaration and a portrait of Washington by Peale. At the head of the stairway is the famous Liberty bell, which bears the inscription, "Proclaim Liberty through all the land unto all the inhabitants thereof" and is supposed (without adequate evidence) to have been the first bell to announce the adoption of the Declaration of Independence. It was cast in England in 1752, was cracked soon after it was brought to America, was recast with more copper in Philadelphia, and was cracked again in 1835 while being tolled in memory of Chief Justice John Marshall, and on the 22nd of February 1843 this crack was so increased as nearly to destroy its sound. On the second floor is the original of the charter which William Penn granted to the city in 1701 and the painting of Penn's treaty with the Indians by Benjamin West. The building has been set apart by the city, which purchased it from the state in 1816, as a museum of historical relics. On the north-west corner of Independence Square is old Congress Hall, in which Congress sat from 1790 to 1800, and in which Washington was inaugurated in 1793 and Adams in 1797. At the north-east corner is the old city-hall, on the second floor of which the Supreme Court of the United States sat from 1791 to 1900. A short distance east of Independence Square in Carpenter's Hall, in which the first continental congress assembled on the 5th of September 1774 and in which the national convention in 1787 framed the present constitution of the United States; the building was also the headquarters of the Pennsylvania committee of correspondence, the basement was used as a magazine for ammunition during the War of Independence, and from 1791 to 1797 the whole of it was occupied by the First United States Bank. The Carpenters' Company (established in 1724) erected the building in 1770, and since 1857 has preserved it wholly for its historic associations. On Arch Street near the Delaware is preserved as a national monument the house in which Betsy Ross, in 1777, made what has been called the first United States flag, in accordance with the resolution of Congress of the 14th of June. Not far from this house is Christ Church (Protestant Episcopal), a fine colonial edifice designed mainly by Dr John Kearsley (1684–1772). The corner stone was laid in 1727, but the steeple, in part designed by Benjamin Franklin and containing a famous chime of eight bells, was not completed until 1754. The interior was restored to its ancient character in 1882, the pews of Washington and Franklin are preserved, and a set of communion plate presented to the church by Queen Anne in 1708 is used on great occasions. In the churchyard are the graves of Benjamin Franklin, Robert Morris, Brigadier-General John Forbes, John Penn, Peyton Randolph, Francis Hopkinson and Benjamin Rush. St Peters, the second Protestant Episcopal Church in the city, has a massive tower and a simple spire; within are the original pews. In the south-east part of the city near the Delaware is the ivy-clad Old Swedes' Church, built of brick in 1698–1700. The house which William Penn built about 1683 for his daughter Letitia was removed to Fairmount Park and rebuilt in 1883. In Germantown (*q.v.*), a suburb which was annexed in 1854, are several other historic buildings.

The dominant feature of the domestic architecture is the long rows, in street after street, of plain two-storey or three-storey dwellings of red ("Philadelphia") pressed brick with white marble steps and trimmings, and with white or green shutters, each intended for one family.

Parks.—Fairmount Park extends along both banks of the Schuylkill for about 5 m. and from the confluence of the Schuylkill and Wissahickon Creek it continues up the latter stream through a romantic glen for 6 m. Its area is about 3418 acres. Five acres of an estate belonging to Robert Morris during the War of Independence and known as "Fair Mount," or "The Hills," were purchased by the municipality for "a city waterworks and for park purposes" in 1812, and from this beginning the park grew to its present dimensions by purchases and gifts. The principal buildings in the park are: the McPherson mansion, once the property of Benedict Arnold and in October 1780 confiscated by the committee of safety; the Peters (or Belmont) Mansion, built in 1745 and much frequented by the notables of the Revolutionary and early national period; the birthplace of David Rittenhouse, the astronomer, and a monastery of the German pietists, both on the banks of Wissahickon; and memorial hall and horticultural hall, both survivals of the Centennial Exhibition of 1876. On Lemon Hill, near the south end of the park, stands the Robert Morris mansion; in the vicinity is the cabin which was General U. S. Grant's headquarters at City Point, Virginia, during the winter of 1864–1865. Near the Columbia Avenue entrance to the park and near the East Park Reservoir are the children's playhouse and playground, endowed by the will of Mrs Sarah A. Smith (d. 1895). At the Green Street entrance is an imposing monument to Washington, designed by Rudolph Siemering and erected by the Society of the Cincinnati in 1896–1897, with a bronze equestrian statue. The Smith Memorial entrance, white granite with bronze statues, was erected in memory of the officers of the Civil War. The park also contains [1] a monument to Lincoln by Randolph Rogers; an equestrian statue of Grant by Daniel Chester French and Edward C. Potter; an equestrian statue of Major-General James Gordon Meade by Alexander Milne Calder; an equestrian statue of Joan of Arc by Emmanuel Fremiet; an heroic bust of James A. Garfield by Augustus St Gaudens; statues of Columbus, Humboldt, Schiller and Goethe; a Tam o' Shanter group of four figures in red sandstone by James Thom; John J. Boyle's "Stone Age in America"; Cyrus Edwin Dallin's "Medicine Man"; Wilhelm Wolff's "Wounded Lioness" (at the entrance to the Zoological Gardens); Albert Wolff's "Lion Fighter"; Auguste Nicolas Cain's "Lioness bringing a Wild Boar to her Cubs"; Edward Kemeys's "Hudson Bay Wolves"; Frederick Remington's "Cow Boy"; and several artistic fountains, and a Japanese temple-gate. In the down-town district, Franklin, Washington, Rittenhouse and Logan squares, equidistant from the city-hall, have been reserved for public parks from the founding of the city; in Rittenhouse Square is the bronze "Lion and Serpent" of A. L. Barye. In Clarence H. Clark Park, West Philadelphia, is Frank Edwin Elwell's group "Dickens and Little Nell." In Broad and Spring Garden streets opposite the Baldwin Locomotive Works is Herbert Adams's statue of Matthias William Baldwin (1795–1866), founder of the works. Close to the bank of the Delaware, some distance N.N.E. of the city-hall, is the small Penn Treaty Park with a monument to mark the site of the great elm tree under which Penn, according to tradition, negotiated his treaty with the Indians in 1682. In the south-west part of the city, along the Schuylkill, is Bartram's botanical garden (27 acres), which the city

[1] Many of the statues and other works of art in Fairmount and other parks are the gift of the Fairmount Park Art Association (1871; reorganized in 1888 and 1906).

added to its park system in 1891, in it is the stone house, with ivy-covered walls, which the famous botanist built with his own hands.

Through the efforts of the City Park Association, organized in 1888, a number of outlying parks, connecting parkways and small triangular or circular parks, have been placed on the city plan. Among these are League Island Park (300 acres), opposite the United States navy yard on League Island; Penny Pack Creek Park (about 1200 acres), extending 6½ m. along Penny Pack Creek, in the north-east; Cobb's Creek Park, extending about 4 m. along the western border; Fairmount Parkway, 300 ft. wide on a direct line south-east from Fairmount Park to Logan Square and somewhat narrower from Logan Square to the city-hall; and Torresdale Parkway (300 ft. wide and 10½ m. long), from Hunting Park, 4½ m. north of the city-hall, along a direct line north-east to the city limits. A plaza at the intersection of Broad and Johnson streets, radiating streets therefrom, and the widening of Broad Street, to 300 ft. from this plaza to League Island Park are also on the city plan. Laurel Hill cemetery, on a high bank of the Schuylkill and contiguous to Fairmount Park, is the city's principal burying ground; in it are the tombs of Dr Elisha Kent Kane, the Arctic explorer, and Major-General Meade.

Theatres.—The first Shakespearean performance in the United States was probably at Philadelphia in 1749; another company played there in 1754 and 1759; and in 1766 was built the Old Southwark theatre, in which Major John André and Captain John Peter De Lancey acted during the British occupation of the city, and which after twenty years of illegal existence was opened "by authority" in 1789. The Walnut Street theatre (1808) is said to be the oldest playhouse in the United States. Other theatres are the Garrick, the large Academy of Music, the Chestnut Street opera house, the Lyric, the Adelphi, the Park and the German.

Clubs.—Among social clubs are the Union League, the University (1881), the Philadelphia, the City, the Markham, the Manufacturers (1887), the Rittenhouse, the Lawyers, the Clover, the Pen and Pencil, the Art, the Mercantile, several country clubs and athletic clubs (notably the Racket), and the foremost cricket clubs in the United States, the Belmont, the Philadelphia, the Keystone, the Merion (at Haverford), and the Germantown (at Manheim).

Museums, Learned Societies and Libraries.—In the southern part of Fairmount Park is a zoological garden with an excellent collection. Its site is the former estate of John Penn, grandson of William Penn. The collection is an outgrowth of the museum, the first in the United States, opened by Charles Willson Peale in Independence Hall in 1802. It is now owned by the Zoological Society (incorporated in 1859) and was opened in 1874. Other museums in Fairmount Park are: the botanical collection in horticultural hall; and in memorial hall the general art collections of the Pennsylvania Museum and School of Industrial Arts and the Wilstach collection of paintings (about 500), including examples of the Italian schools from the 15th to the 17th centuries and of modern French and American painters. Bartram's botanical garden, mentioned above as a city park, was established in 1728 by John Bartram (1699–1777) and is the oldest botanical garden in America. The Philadelphia Commercial Museums, founded in 1894, is a notable institution for promoting the foreign commerce of the United States, having a collection of raw materials and manufactured products from all countries, a laboratory and a library. The institution investigates trade conditions and the requirements of markets in all parts of the world, maintains a bureau of information, issues a weekly bulletin for American exporters and a monthly publication for foreign buyers, and has published several "foreign commercial guides" and other commercial works. The museum is maintained chiefly by municipal appropriations and by fees. Its control is vested in "The Board of Trustees of the Philadelphia Museums," composed of fourteen citizens of Philadelphia chosen for life and eight *ex officio* members who are the incumbents of the leading state and municipal offices. There are home and foreign advisory boards, and the immediate management is under a director. In 1727 Franklin, then in his twenty-second year, formed most of his "ingenious acquaintance into a club," which he called the Junto, "for mutual improvement," and out of the Junto grew in 1731 the library of the Library Company of Philadelphia, which he spoke of as the "mother of all North American subscription libraries," but which was not the first subscription library in North America. The Library Company of Philadelphia absorbed in 1769 the Union Library, which had been founded some years before; and in 1792 the Loganian library, a valuable collection of classical and other works provided for under the will of James Logan, a friend of Penn, was transferred to it. Subsequently it acquired by bequest the libraries of the Rev. Samuel Preston of London and of William Mackenzie of Philadelphia. Among the rarities in the latter was a copy of Caxton's *Golden Legend* (1486). In 1869 the Library Company was made the beneficiary, under the will of Dr James Rush (1786–1869), of an estate valued at about a million dollars, and with this money the Ridgway branch was established in 1878. The library has owned its building since 1790; the building on the present site was opened in 1880 and was enlarged in 1889.

The American Philosophical Society, founded by Franklin in 1743, is the oldest and the most famous academy of science in America. Its organization was the immediate consequence of a circular by Franklin entitled, *A Proposal for Promoting Useful Knowledge among the British Plantations in America*. In 1769 it united with (and officially took the name of) "The American Society held at Philadelphia for Promoting Useful Knowledge." Among its early presidents were Franklin, Rittenhouse and Jefferson. It has a valuable library—about 50,000 vols.—containing the great mass of the correspondence of Franklin; here, too, are many interesting relics, among them the chair in which Jefferson sat while writing the Declaration of Independence and an autograph copy of the Declaration. The society has published 27 quarto vols. of *Transactions* (1771–1908); its *Proceedings* have been published regularly since 1838, and in 1884 those from 1744 to 1838, compiled from the manuscript minutes, were also published. The Academy of Natural Sciences of Philadelphia, founded in 1812, has been noted for its collection of birds since it acquired, in 1846, the collection of the duc de Rivoli numbering more than 12,000 specimens; several smaller collections have since been added. The academy has a notable collection of shells and fossils and the "types" of Leidy, Cope, Say, Conrad and other naturalists, and a library. It is composed of the following "sections": biological and microscopical (1868), entomological (1876), botanical (1876), mineralogical and geological (1877) and ornithological (1891). It has published a *Journal* since 1817 and its *Proceedings* since 1841, and periodicals on entomology, conchology and ornithology. To a few young men and women it gives training in scientific investigation without charge. The Pennsylvania Historical Society, organized in 1824, has a valuable collection of historical material, including the papers of the Penn family and the Charlemagne Tower collection of American colonial laws, and many early American printed handbills and books (especially of Bradford, Franklin and Christopher Saur), portraits and relics. With the proceeds of the society's publication fund the *Pennsylvania Magazine of History and Biography* has been published since 1877. The Numismatic and Antiquarian Society of Philadelphia, organized in 1858, is the oldest numismatic organization in the United States; it has a collection of coins, and since 1865 it has published its *Proceedings*. The College of Physicians and Surgeons has an excellent medical library. The free library of Philadelphia (established 1891) includes a main library and several branches. Other important libraries are that of the university of Pennsylvania, the Mercantile, that of Franklin Institute, that of the Law Association of Philadelphia, the Athenaeum, that of the German Society of Pennsylvania, and Apprentices'. The free museum of science and art of the university of Pennsylvania has valuable archaeological collections, notably the American and the Babylonian collections made by university expeditions.

Schools.—William Penn in his frame of government provided for a committee of manners, education and art. The assembly, in March 1683, passed an act which provided that all children should be taught to read and write by the time they were twelve years of age, that then they should be taught some useful trade, and that for every child not so taught the parent or guardian should be fined five pounds. At a meeting of the provincial council held in Philadelphia in 1683 the governor and council appointed as school-master, Enoch Flower, who for twenty years had held that position in England. But schools were left almost wholly to private initiative until 1818. The first grammar school, commonly known in its early years as the Friends' free school, was established in 1689 under the care of the celebrated George Keith; although maintained by the Friends it was open to all, and for more than sixty years was the only public place for free instruction in the province. It was chartered by Penn in 1701, 1708 and 1711, in time became known as the William Penn Charter School, and is still a secondary school on Twelfth Street. In 1740 a building was erected for a "charity school" and for a "house of worship," but the school had not been opened when, in 1749, Franklin published his *Proposals relating to the Education of Youth in Pennsylvania*. Under the influence of this publication a new educational association was formed which purchased the building and in January 1751 opened in it an institution that was chartered as an "academy and charitable school" in 1753, was rechartered as a college and academy in 1755, and became the university of Pennsylvania by act of the state legislature passed in 1791. The university occupied the site of the present post office from 1802 until 1872, but was then removed to grounds near the western bank of the Schuylkill.

The foundation of the present public school system was laid in 1818 by an act of the legislature which constituted the city and county of Philadelphia the first school district of Pennsylvania, and provided for the establishment therein of free schools for indigent orphans and the children of indigent parents; the same act authorized the establishment of a model school for the training of teachers, which was the pioneer school for this purpose in America. In 1834 free elementary schools were authorized for all children of school age, and since then the system has developed until it embraces the Central High School for boys, which has a semi-collegiate course with a department of pedagogy and confers the degrees of B.A. and B.S.; a Normal High School for girls, into which the model school was converted in 1848, in which most of the teachers of the city are trained and which only graduates of the Girls' High School are permitted to enter; the William Penn High School for Girls (opened 1909) with academic, commercial, applied arts,

household science and library economy departments; a school of industrial arts; two manual training schools; about one hundred night schools (attended mainly by adults); several special schools for habitual truants or insubordinate and disorderly children; and a number of vacation schools and playgrounds for the summer season. In 1909 district high schools were planned as a part of the public school system. The city has also many private high schools and academies.

Besides the university of Pennsylvania and the Central High School for Boys the collegiate institutions are La Salle College (Roman Catholic; opened in 1867) and the Temple University (non-sectarian; chartered in 1888 as Temple College after four years of teaching; in 1891 received the power to confer degrees); which is designed especially for self-supporting men and women, and was founded by Russell Hermann Conwell (b. 1842), a lawyer and journalist, who entered the Baptist ministry in 1879, was pastor of the Grace Baptist Church of Philadelphia in 1881–1891, became pastor of the Grace Baptist Temple in 1881, and was a public lecturer. He was the first president of the Temple College, which was begun in connexion with the work of his church. Temple University offers instruction both day and evening, has classes from the kindergarten to the highest university grades, and courses in business, civil engineering, domestic art and domestic science, physical training, pedagogy and music; it has a theological school (1893), a law school (1894), a medical school (1901) and a school of pharmacy (1902); and in 1907 the Philadelphia Dental College, one of the best known dental schools in the country, joined the university. In 1893 a trust fund left by Hyman Gratz was used to found the Gratz College for the education of teachers in Jewish schools and for the study of the Hebrew language and Jewish history, literature and religion; the college is under the control of the Kaal Kidosh Mikoe Israel of Philadelphia. Bryn Mawr College (*q.v.*), one of the leading institutions in America for the higher education of women, is a few miles beyond the city limits. Schools of medicine, for which Philadelphia has long been noted, include the department of medicine of the university of Pennsylvania (opened in 1765); Jefferson Medical College (1825); the Woman's Medical College (1850), the first chartered school of medicine for women to confer the degree of M.D.; the Medico-Chirurgical College (1881); Hahnemann (homoeopathic) Medical College (1888); and the department of medicine of Temple University (1901). Among other professional schools are the department of law of the university of Pennsylvania (1790), the law school of Temple University (1894); the divinity school of the Protestant Episcopal Church (1861); the Lutheran theological Seminary (1864); Saint Vincent's (Theological) Seminary (R.C., 1868); the theological school of Temple University (non-sectarian, 1893); Pennsylvania College of Dental Surgery (1856); Philadelphia Dental College (1863; since 1907 a part of Temple University); the department of dentistry of the university of Pennsylvania (1878); the department of dentistry of the Medico-Chirurgical College (1897); the Philadelphia College of Pharmacy (1821); the department of pharmacy of the Medico-Chirurgical College (1898); and the school of pharmacy of Temple University (1902). Girard College (see GIRARD, STEPHEN) is a noted institution for the education of poor white orphan boys. The Pennsylvania Academy of the Fine Arts, founded in 1805 in Independence Hall, was the first art school in America; it occupies a fine building on Broad and Cherry Streets, with a gallery of about 500 paintings, including examples of early American masters (especially Gilbert Stuart, of whom it has the largest collection), of modern American artists (especially in the Temple collection), and, in the collection of Henry C. Gibson, of French landscapes. The Drexel Institute of Arts and Sciences, founded in 1891 by Anthony J. Drexel and endowed by him with $2,000,000, occupies a beautiful building (Chestnut and 32nd Streets; opened in 1891) and embraces the following departments: architecture, science and technology, commerce and finance, domestic science, domestic arts, library school, English language and literature, history, civil government and economics, physical training, evening classes, department of free public lectures and concerts, library and reading room, and museum and picture gallery. The institution bestows free scholarships on a considerable number of students and charges the others very moderate fees. Its building houses a library, a collection of rare prints and autographs, and a museum with a picture gallery and exhibits of embroidery, textiles, ceramics, wood and metal work, &c. The Pennsylvania Museum and School of Industrial Art founded in 1876 and opened in 1877, has schools at Broad and Pine Streets—the museum is housed in Memorial Hall in Fairmount Park. The school is a pioneer in America; it was originally a school of applied art, but in 1884 the Philadelphia textile school was established as another department. The Wagner Free Institute of Science, founded by William Wagner in 1855, has a library and a natural history museum, provides free lectures on scientific subjects, and publishes *Transactions*, containing scientific memoirs. The Franklin Institute for the promotion of mechanic arts (1824) has a technical library (with full patent records of several nations); since 1824 it has held exhibitions of manufactures; it has published since 1826 the *Journal of the Franklin Institute*; the institute provides lecture courses and has night schools of drawing, machine design and naval architecture. The Spring Garden Institute (1851), with day classes in mechanical drawing, handiwork, and applied electricity, and night classes in those subjects and in freehand and architectural drawing; the Philadelphia School of Design for Women (1836), of which Emily Sartain, a daughter of John Sartain, became principal in 1886; and a school of horology (1894) are other manual and industrial training schools within the city, and not far beyond the city limits is the Williamson Free School of Mechanical Trades (1888), endowed by Isaiah Vansant Williamson (1803–1889) with more than $5,000,000 for the free training of bricklayers, machinists, carpenters, pattern-makers, stationary engineers and other mechanics. The Lincoln Institution and Educational Home until 1907 was devoted mainly to the education of Indians.

Newspapers and Periodicals.—The *American Weekly Mercury* was the first newspaper published in Philadelphia and the third in the colonies. It was first issued on the 22nd of December 1719 by Andrew Sowle Bradford, a son of William Bradford, the first printer in the Middle Colonies, and was the first newspaper in these colonies. The second newspaper in the city and in the province was the *Universal Instructor in all Arts and Sciences and Pennsylvania Gazette*. It was established in 1728 by Samuel Keimer, but less than a year afterwards it became the property of Benjamin Franklin and Hugh Meredith, who shortened its title to the *Pennsylvania Gazette*. The only one of the newspapers established during the colonial era which survived the 19th century was the *Pennsylvania Packet or General Advertiser*, which was started in 1771 by John Dunlap, and during the War of Independence was published semi-weekly, with occasional "postscripts" of important news; in 1839 it was absorbed by the *North American* (1829), with which the *United States Gazette* (1789) was united in 1847 and which is still published as the *North American*. The *Aurora and General Advertiser*, established in 1790 by Benjamin Franklin Bache (1769–1798), a grandson of Franklin, was a notorious anti-Federalist organ in its early years. A pioneer among newspapers at modern prices is the *Public Ledger*, founded in 1836, and in 1864 purchased by George William Childs. Other prominent daily papers now published are the *Inquirer* (Republican; 1829), the *Press* (Republican; 1857), the *Record* (Independent Democrat; 1870), the *Demokrat* (German; 1838), the *Evening Bulletin* (Republican; established in 1815 as the *American Sentinel*), the *Evening Item* (1847), the *Evening Telegraph* (Independent Republican; 1864), and the *Tageblatt* (Labour; German; 1877). Many of the earlier literary periodicals of America were published in Philadelphia; among them were the *American Magazine* (1757–1758 and 1769), Thomas Paine's *Pennsylvania Magazine* (1775–1776), the *Columbian Magazine* (1786–1790; called the *Universal Asylum* in 1790) which was edited by Matthew Carey and by A. J. Dallas, the excellent *American Museum* (1787–1792 and 1798), with which Carey was connected, the *Port Folio* (1801–1827; edited until 1812 by Joseph Dennie) and the *Analectic* (1802–1812) which succeeded *Select Reviews and Spirit of the Foreign Magazines* (1809), of which Washington Irving was editor in 1813–1814, and to which Paulding and Verplanck contributed, and the *American Quarterly Review* (1827–1837). Among others were: *Godey's Lady's Book* (1830–1877), for which Poe, Irving, Longfellow, Willis and others wrote; and *Graham's Lady's and Gentleman's Magazine* (1840–1859), with the contributors just named and Cooper, John G. Saxe, E. P. Whipple and others. *Lippincott's Magazine* (1868) is a monthly, best known for its fiction. The *Saturday Evening Post*, which has the largest circulation of the weekly publications, and the *Ladies' Home Journal* (1883), the semi-monthly with the largest circulation, are owned by the same company. The *Farm Journal* (1877) is a well-known agricultural monthly.

Trusts, Charities, &c.—Girard College and thirty-eight other charities are maintained out of the proceeds of as many trusts, which are administered by a board of directors composed of twelve members, appointed by the courts of common pleas, and the mayor, president of the select council, and president of the common council as *ex officio* members. In 1907 the invested capital of the Girard Trust alone amounted to $24,467,770 and the income from it was $1,988,054. The total capital of all the minor trusts in the same year was $1,583,026 and the income from this was $56,730. Among the minor trust funds are: Wills Hospital (established in 1825); Benjamin Franklin Fund (1790) for aiding young married artificers; Thomas D. Grover Fund (1849) for providing the poor with fuel and food; Mary Shields Almshouse Fund (1880); and the John Scott Medal Fund (1816) for bestowing medals upon young inventors. To Franklin Philadelphia is largely indebted for the Pennsylvania hospital, the first hospital in the United States, which was projected in 1751 and is one of the foremost of nearly one hundred such institutions in the city. The municipal hospital for contagious diseases and hospitals for the indigent and the insane are maintained by the municipality, but most of the other institutions for the sick are maintained by medical schools and religious sects. Municipal charities are under the supervision of the department of public health and charities. Philadelphia is the seat of the state penitentiary for the eastern district, in which, in 1829, was inaugurated the "individual" system, *i.e.* the separate imprisonment and discriminating treatment of criminals with a view to effecting their reform.

Transportation and Commerce.—Nearly every street in the business centre and about one-third of the streets throughout the

built-up portion of the city have a single track of electric railway (overhead trolley), and most of the wider ones, except Broad Street, which has none, have a double track. A subway line has been opened for a short distance under Market Street, and other subway lines, as well as elevated lines, have been projected. The entire system, embracing in 1909 a total of 624·21 m., is operated by the Philadelphia Rapid Transit Company. Several inter-urban electric lines afford cheap service to neighbouring towns and cities. The extensive railway system under the control of the Pennsylvania railway together with the Baltimore & Ohio railway affords transportation facilities north to New York, south to Baltimore, Washington and the south, west to the bituminous coalfields of Pennsylvania, the grain fields of the Middle West, and to Pittsburg, Cleveland, Cincinnati and Chicago. The Philadelphia & Reading railway connects the city with the great anthracite coal region, and both the Philadelphia & Reading and the Pennsylvania control a line to Atlantic City. The Schuylkill is navigable for small craft to the "Fall line," about 7¾ m. above its mouth and for vessels drawing 26 ft. to the oil refineries at Point Breeze, 3 m. from the mouth; from Point Breeze to the head of navigation the channel depth varies from 14 to 22 ft. The Delaware River is navigable to Trenton, New Jersey, about 30 m. above the upper end of the port of Philadelphia, and although in its natural condition this river was only 17 ft. deep at low water in its shallowest part below the port this depth was increased between 1836 and 1899 to 26 ft. (except in three shoal stretches), and a project of the Federal government was adopted in 1899 for increasing the depth to 30 ft. and the width to 600 ft. In 1905 the city of Philadelphia and the state of Pennsylvania appropriated $750,000 for the improvement of the river between the city and the southern boundary of the state.[1] Steamships ply regularly between Philadelphia and several European ports, ports in the West Indies, and ports of the United States.

The port extends from the Pennsylvania railway terminal at Greenwich Point up the Delaware River to the Philadelphia & Reading terminal at Port Richmond, a distance of about 8 m., and there are minor harbour facilities on the Schuylkill. The natural facilities, together with the improvements that have been made, were long offset by an inefficient port administration under an antiquated law of 1803 which permitted the wharves to pass largely under private control; but in 1907 the old board of port wardens was abolished and in its place was created a municipal department of wharves, docks and ferries.

Until the opening of the Erie Canal, in 1825, Philadelphia was the emporium of the Unites States; it was then displaced by New York. Some years later Philadelphia lost its lucrative China trade, and its decline in commercial importance continued until 1883, when the value of its imports amounted to only $32,811,045, the value of its exports to only $38,062,434, and the city was outranked in foreign trade by New York, Boston, San Francisco and New Orleans. By 1900, however, the value of its imports had risen to $49,191,236 and the value of its exports to $81,327,704; in 1909 the value of the imports was $78,003,464, an amount less than one-eleventh that of New York, but exceeded only by New York and Boston, and the value of the exports was $80,650,274, an amount less than one-eighth that of New York, but exceeded only by New York, Galveston and New Orleans. The principal imports are sugar, drugs and chemicals, goatskins, wool, tobacco, jute and burlap, and cotton goods, iron ore, manufactured iron, hides and bananas; the principal exports are iron (manufactured), steel, petroleum, wheat, flour, lard, cattle and meat products. The proximity of the city to New York, whence many of its products are shipped, makes the statistics of its direct imports and exports no true index of its commercial importance.

Manufactures.—Philadelphia has always been one of the foremost manufacturing centres in the United States, and in 1905 it was outranked only by New York and Chicago.[2] The total value of its factory product was $519,981,812 in 1900, and $591,388,078 in 1905. Measured by the value of the products, Philadelphia ranked first among the cities of the country in 1905 in refining sugar and molasses ($37,182,504; 13·4% of the total of the country) and in the manufacture of carpets and rugs ($25,232,510; 41 % of the total of the country), leather ($23,903,239; 9·5 % of the total of the country), hosiery and knit goods ($15,770,873; 11·5 % of the total of the country), woollen goods ($12,239,881; 8·6 % of the total of the country), and felt hats ($5,847,771; 16 % of the total of the country); second in the manufacture of worsted goods ($26,964,533; 16 % of the total of the country) and in dyeing and finishing textiles ($4,371,006; 8·6 % of the total of the country); and third in the manufacture of clothing ($31,031,882; 5·1 % of the total of the country) and silk goods ($5,079,193; 3·8 % of the total of the country). Other large industries are the manufacture of foundry and machine-shop products, cotton goods, malt liquors, iron and steel, chemicals, cigars and cigarettes, soap, confectionery, furniture, paints, boots and shoes, electrical apparatus, and cordage and twine, and among notable individual establishments are the Baldwin Locomotive Works, the Cramp Ship-Yards and the Disston or Keystone Saw Works. There are petroleum refineries at Point Breeze near the mouth of the Schuylkill; petroleum is piped to them from the north-west part of the state.

Water Supply.—The first municipal waterworks, installed in 1799–1801, pumped water by steam power from the Schuylkill into an elevated tank in Centre Square, where the city hall now stands; this was one of the earliest applications of steam to municipal water pumping. In 1812–1815 new steam works were installed on Quarry Hill, or Fairmount; in 1819–1822 pumping works operated by water power were substituted for those operated by steam; and it was in great part for the preservation of the purity of the water supply that Fairmount Park was created. The park, however, did not serve its purpose in this respect. The water was impure and inadequate; additional works were installed from time to time, mostly on the Schuylkill, whence water was pumped by steam to reservoirs from which distribution was made by gravity; and to meet the increasing demands new filtration works and accessories were installed in 1901–1908. These take the water mainly from the Delaware River.

Government and Finances.—Inasmuch as it has been proved that in 1683 there was in use in Philadelphia a seal bearing the inscription "Philadelphia . 83 . William . Penn . Proprietor . and . Governor" and in all respects different from the provincial seal or the county seal, it seems that there was then a distinct government for the city. In July 1684 the provincial council, presided over by William Penn, appointed a committee to draft a borough charter, but there is no record of the work of this committee, and it is uncertain what the government of Philadelphia was for the next seventeen years.[3] In 1701 Penn himself issued a charter creating a close corporation modelled after the English borough and under this the city was governed until the War of Independence. Upon the annulment of the Penn charter by the Declaration of Independence, government by commissions was established, but in 1789 a new charter was granted and, although the government has since undergone many and great changes, it is by virtue of this charter that the city remains a corporation to-day. The Consolidation Act of 1854 extended the boundaries to the county lines without destroying the county government, changed the corporate name from "Mayor, Aldermen, and Citizens of Philadelphia" to "the City of Philadelphia," created the offices of controller and receiver of taxes, and considerably modified the powers and duties of the corporation and its officers. The Bullitt Act, passed in 1885 to go into effect in 1887, and since 1885 amended and supplemented, is a new charter except in name; particularly notable is its transfer of the balance of power from the councils and various self-perpetuating commissions to the mayor.

The mayor is elected for a term of four years and is not eligible to the office for the next succeeding term. With the advice and consent of the select council he appoints the directors of the departments of public safety, public works,[4] health and charities, supplies and (since 1907) wharves, docks and ferries, and the three members of the civil service commission. He may appoint three persons to examine any department and for reasons given in writing may remove any officer whom he has appointed. His veto power extends to items in appropriation bills, but any item or ordinance may be passed over his veto within five days of such veto by an affirmative vote of three-fifths of the members elected to each council. The select council is composed of one member from each of the 47 wards, and in the common council each ward has one member for every four thousand names on the last completed assessment list (including names of those paying poll taxes as well as those paying taxes on real or personal property); in 1909 there were 80 members of the common council. The several administrative departments

[1] The city had previously expended $1,555,000 on the improvement of the Delaware and Schuylkill rivers.

[2] The Philadelphia Museums claim that excluding slaughter-house and sweat-shop products the value of Philadelphia's manufactured products is greater than that of any other city in the country.

[3] A document purporting to be a charter, bearing the date of the 20th of May 1691, and signed by Thomas Lloyd, deputy-governor, was discovered in 1887, but the great seal is missing and there is no evidence that the charter was ever in operation. The minutes of "a meeting of the Council held at Philadelphia on the third day of Sixth Month 1691" mention "Humphrey Morrey the present Mayor of the city of Philadelphia"; and this would seem to show that there was a regular municipal government in 1691. See *Philadelphia: Its Founding and Seals: Report of the Committee . . . to determine the Year of the Physical and Legal Founding of the City of Philadelphia* (Philadelphia, 1908).

[4] In 1905 the state legislature took the appointment of these officers from the mayor and vested it in the councils, but this legislation was repealed in 1906.

are: public safety, public works, receiver of taxes, city treasurer, city controller, law, education, charities and corrections, supplies, wharves, docks and ferries, civil service cummission and sinking fund commission (composed of the mayor, the city controller and a commissioner elected by a majority vote of the city councils). Members of the select council are elected for three years—one-third each year; members of the common council for two years—one half each year; and the receiver of taxes, the city treasurer, the city controller, and the city solicitor, who is the head of the department of law, for a term of three years. The police constitute a bureau of the department of public safety, and at their head is a superintendent appointed by the director of the department with the approval of the select council. The department of education is administered by a central board appointed (at large) by the judges of the courts of common pleas.

The assessed value of taxable property in the city increased from $153,369,048 in 1856 to $536,667,834 in 1880, to $880,935,265 in 1900, and to $1,358,675,057 in 1910. The city's yearly expenditure increased from $5,170,080 in 1856 to $14,040,479 in 1880, to $30,628,246 in 1900, and to $48,012,630 in 1909. The principal items of expenditure in 1909 were: for public schools, $8,242,218; for the bureau of water, $2,827,200; for streets and highways, $4,219,200; for police, $3,810,535; and for protection against fire, $1,873,720. The receipts for the same year were $44,372,927, of which $18,851,442 were from the property tax (municipal and state), and $4,396,124 were from the water tax. The city's indebtedness increased rapidly for a period of twenty-five years following consolidation. At the beginning of 1856 the funded debt was $16,781,470, by the beginning of 1870 it had grown to $42,401,933, and by the beginning of 1880 to $70,970,041. By the new state constitution adopted in 1873 no municipality is permitted to create a debt exceeding 7 % of the assessed value of its taxable property,[1] in 1879 the state legislature passed an act to prevent the city from living beyond its income, and as a consequence of these restrictions the funded debt, less loans held by the sinking fund, was reduced by the beginning of 1895 to $33,139,695. The great expense of installing the new filter plant, developing the park system, and making other improvements has, however, caused it to grow again; at the beginning of 1910 the total funded debt was $95,483,820 and the net funded debt was $84,901,620.

History.—The patent granted to William Penn for the territory embraced within the present commonwealth of Pennsylvania was signed by Charles II. on the 4th of March 1681 and Penn agreed that "a quantity of land or ground plat should be laid out for a large town or city in the most convenient place upon the river for health and navigation," and that every purchaser of 500 acres in the country shall be allowed a lot of 10 acres in the town or city, "if the place will allow it." In September Penn appointed William Crispin, Nathaniel Allen and John Bezan a commission to proceed to the new province and lay out the city, directing them to select a site on the Delaware where "it is most navigable, high, dry and healthy; that is where most ships can best ride, of deepest draught of water, if possible to load or unload at the bank or key side without boating or lightering of it." Crispin, a kinsman of the proprietor, died on the voyage out, but William Heage had been named a fourth commissioner some time after the appointment of the others and the three survivors arrived in the province toward the close of the year. They had been preceded by Penn's cousin, Captain William Markham, as deputy-governor, and were soon followed by the surveyor-general, Thomas Holme. Although the Swedes had established a settlement at the mouth of the Schuylkill not later than 1643 and the site now selected by the commissioners was held by three brothers of the Swaenson family, these brothers agreed to take in exchange land in what is now known as Northern Liberties, and as early as July 1682 Holme, according to modified instructions from Penn for making the lots smaller than originally intended, laid out the city extending from the Delaware River on the east to the Schuylkill River on the west, a distance of about 2 m., and from Vine Street on the north to Cedar (now South) Street on the south, a distance of about 1 m. Penn landed at New Castle on the Delaware on the 27th of October 1682 and two days later came up as far as Upland, now Chester, 13 m. south of Philadelphia, but when he came to his newly founded city is not known. He is known, however, to have presided at a meeting of the provincial council held here on the 10th of March 1683, and from that time Philadelphia was the capital of Pennsylvania until 1799, when Lancaster became the capital. During nearly the whole of this period it was also the most important city commercially, politically and socially in the colonies. Quaker influence remained strong in the city, especially up to the beginning of the 19th century; and it was predominant in Philadelphia long after it had given way before the Scotch-Irish in the rest of Pennsylvania. But even in Philadelphia the academy (later the university of Pennsylvania) soon came under the control of the Protestant Episcopal Church. The first continental congress met in Carpenters' Hall on the 5th of September 1774; the second in the old state house (Independence Hall) on the 10th of May 1775; and throughout the War of Independence, except from the 26th of September 1777 to the 18th of June 1778, when it was in possession of the British,[2] Philadelphia was the virtual capital of the colonies; it was a brilliant social city, especially during the British possession. The national convention which framed the present constitution of the United States sat in Philadelphia in 1787, and from 1790 to 1800 the city was the national capital. Here Benjamin Franklin and David Rittenhouse made their great contributions to science, and here Washington delivered his farewell address to the people of the United States. Here, in July and August 1789, the clerical and lay delegates from the Protestant Episcopal Churches in the United States met and formally organized the Protestant Episcopal Church in the United States. Here the first bank in the colonies—the Bank of North America—was opened in 1781, and here the first mint for the coinage of the money of the United States was established in 1792. The city was visited with an epidemic of yellow fever in 1793 and again in 1798; and in 1832 nearly 1000 inhabitants died of Asiatic cholera.

The original boundaries remained unchanged for 172 years, but the adjoining territory as it became populated was erected into corporated districts in the following order: Southwark (1762), Northern Liberties (1771), Moyamensing (1812), Spring Garden (1813), Kensington (1820), Penn (1844), Richmond (1847), West Philadelphia (1851) and Belmont (1853). In 1854 all these districts, together with the boroughs of Germantown, Frankford, Manayunk, White Hall, Bridesburg and Aramingo, and the townships of Passyunk, Blockley, Kingsessing, Roxborough, Germantown, Bristol, Oxford, Lower Dublin, Moreland, Byberry, Delaware and Penn were abolished and the boundaries of Philadelphia were extended to the county lines by a single act of the state legislature. The consolidation was in part the outcome of a demand for efficiency in preserving order. There had been occasional outbreaks of disorder: on the 17th of May 1838 an anti-abolition mob had burned Pennsylvania Hall, which had been dedicated three days before to the discussion of abolition, temperance and equality; in May 1844 anti-Catholic rioters had burned St Michael's and St Augustine's churches, and minor riots had occurred in 1835, 1842 and 1843. Philadelphia was from the first strongly anti-slavery in sentiment, and it was here in December 1833 that the American Anti-Slavery Society was organized, and in 1856, on the anniversary of the battle of Bunker Hill, that the first national convention of the Republican party met. During the Civil War the arsenal and the Southwark navy yard were busy manufacturing material for the Federal armies, the city was crowded with wounded soldiers, and here in 1864 was held the great sanitary fair for the benefit of the United States sanitary commission, an organization for the relief and care of wounded and sick soldiers. In 1876, the centennial year of American independence, a great exhibition of the industries of all nations was held in Fairmount Park from the 10th of May to the 10th of November, and about fifty buildings were erected for the purpose. In October 1882 the city celebrated the bi-centennial of the landing of William Penn, and in October 1908 the 225th anniversary of its foundation.

[1] If the debt of a city already exceeded the 7 % limit it could be increased only by permission of the legislature.

[2] Lord Howe, who had been in command of the British, embarked for England on the 24th of May, and on the 18th of this month was held for his farewell entertainment the famous *Mischianza*, a feast of gaiety with a tournament somewhat like those common in the age of chivalry, which was in large part planned by Captain John André.

PHILADELPHIANS, a sect of religious mystics, founded in London in the latter part of the 17th century. In 1652 Dr John Pordage (1607–1681), rector of Bradfield, Berkshire, gathered together a few followers of Jakob Boehme, the chief of whom was Jane Lead or Leade (*née* Ward; 1623–1704). Pordage was ejected from his living by the Triers in 1655, but was restored in 1660. Mrs Leade had been from girlhood of a mystical temperament, and experienced phantasms which she recorded in a diary entitled *A Fountain of Gardens*, beginning in 1670, in which year the Philadelphian society was definitely organized. She drew up for it "The Laws of Paradise," which show that the enterprise was designed "to advance the Kingdom of God by improving the life, teaching the loftiest morality, and enforcing the duty of universal brotherhood, peace and love." Its members had a strong faith in what they called the "Divine Secrets," the wonders of God and nature, the profound spiritual experiences of regeneration and soul-resurrection, and the second Advent. In 1693 some of Mrs Leade's writings were translated into Dutch, and by this means and her acquaintance with Francis Lee (1661–1719), an Oxford scholar who studied medicine at Leiden and became her son-in-law, a connexion was opened up with Germany and Holland. In 1703 the Philadelphians drew up their confession, but they made no further progress and soon declined. The Holland branch withdrew, and the English government forbade the society to meet. For many years, however, a considerable number of people regarded Mrs Leade's visions, which were published in a long series of writings, as proofs of her divine calling. In her later years she had a severe struggle with poverty, which was relieved by a pension granted by Baron Kniphausen.

PHILAE, an islet in the Nile above the First Cataract, of great beauty and interest, but since the completion of the Assuan dam in 1902 submerged except for a few months yearly during High Nile (July to October), when the water is allowed to run freely through the sluices of the Assuan dam. Philae is the nearest island to the point where the ancient desert road from Assuan rejoins the river south of the cataract. It marks also the end of the cataract region. Below it the channel is broad and straight with rocky granite islands to the west. The name in Egyptian was Pilak, "the angle (?) island": the Arabs call it Anas el Wagud, after the hero of a romantic tale in the *Arabian Nights*. Ancient graffiti abound in all this district, and on Bigeh, a larger island adjoining Philae, there was a temple as early as the reign of Tethmosis III. The name of Amasis II. (570–535 B.C.) is said to have been found at Philae, and it is possible that there were still older buildings which have been swallowed up in later constructions. About 350 B.C. Nekhtnebf, the last of the native kings of Egypt, built a temple to Isis, most of which was destroyed by floods. Ptolemy Philadelphus reconstructed some of this work and began a large temple which Ptolemy Euergetes I. completed, but the decoration, carried on under later Ptolemies and Caesars, was never finished. The temple of Isis was the chief sanctuary of the Dodecaschoenus, the portion of Lower Nubia generally held by the Ptolemies and Romans. The little island won great favour as a religious resort, not only for the Egyptians and the Ethiopians and others who frequented the border district and the market of Assuan, but also for Greek and Roman visitors. One temple or chapel after another sprang up upon it dedicated to various gods, including the Nubian Mandulis. Ergamenes (Arkamane), king of Ethiopia, shared with the Ptolemies in the building. Besides the temple of Isis with its birth-temple in the first court, there were smaller temples or shrines of Arsenuphis, Mandulis, Imuthes, Hathor, Harendotes (a form of Horus) and Augustus (in the Roman style), besides unnamed ones. There were also monumental gateways, and the island was protected by a stone quay all round with the necessary staircases, &c., and a Nilometer. The most beautiful of all the buildings is an unfinished kiosque inscribed by Trajan, well known under the name of "Pharaoh's Bed." Graffiti of pilgrims to the shrine of Isis are dated as late as the end of the 5th century A.D. The decree of Theodosius (A.D. 378) which suppressed pagan worship in the empire was of little effect in the extreme south. In A.D. 453 Maximinus, the general of the emperor Marcian, after inflicting a severe defeat on the Nobatae and Blemmyes who were settled in Lower Nubia, and thence raided Upper Egypt, made peace on terms which included permission for these heathen tribes to visit the temple and even to borrow the image of Isis on certain occasions. It was not till the reign of Justinian, A.D. 527–565, that the temple of Philae was finally closed, and the idols taken to Constantinople. Remains of Christian churches were disclosed by the thorough exploration carried out in 1895–1896 in view of the Barrage scheme, under the direction of Captain Lyons. The accumulations of rubbish on the island were cleared away and the walls and foundations of the stone buildings were all repaired and strengthened before the dam was completed. The annual flooding now appears to be actually beneficial to the stonework, by removing the disintegrating salts and incrustations. The tops of most of the buildings and the whole nucleus of the temple of Isis to the floor remained all the year round above the water level until the dam was raised another 26 ft.—a work begun in 1907—when the temples were entirely submerged except during July–October. But the beauty of the island and its ruins and palm trees, the joy of travellers and artists, is almost gone.

See H. G. Lyons, *A Report on the Island and Temples of Philae* (Cairo, 1896), with numerous plans and photographs; a second report, *A Report on the Temples of Philae* (1908), deals with the condition of the ruins as affected by the immersions occasioned by the filling of the Assuan dam; Baedeker's *Egypt*; and on the effects of the submersion, &c., reports in *Annales du service des antiquités*, vols. iv. v. (F. Ll. G.)

PHILARET [Theodore Nikitich Romanov] (?1553–1633), patriarch of Moscow, was the second son of the boyar Nikita Romanovich. During the reign of his first cousin Theodore I. (1584–1598), Theodore Romanov distinguished himself both as a soldier and a diplomatist, fighting against the Swedes in 1590, and conducting negotiations with the ambassadors of the emperor Rudolph II. in 1593–1594. On the death of the childless tsar, he was the popular candidate for the vacant throne; but he acquiesced in the election of Boris Godunov, and shared the disgrace of his too-powerful family three years later, when Boris compelled both him and his wife, Xenia Chestovaya, to take monastic vows under the names of Philaret and Martha respectively. Philaret was kept in the strictest confinement in the Antoniev monastery, where he was exposed to every conceivable indignity; but when the pseudo-Demetrius overthrew the Godunovs he released Philaret and made him metropolitan of Rostov (1605). In 1609 Philaret fell into the hands of pseudo-Demetrius II., who named him patriarch of all Russia, though his jurisdiction only extended over the very limited area which acknowledged the impostor. From 1610–1618 he was a prisoner in the hands of the Polish king, Sigismund III., whom he refused to acknowledge as tsar of Muscovy on being sent on an embassy to the Polish camp in 1610. He was released on the conclusion of the truce of Deulino (Feb. 13, 1619), and on the 2nd of June was canonically enthroned patriarch of Moscow. Henceforth, till his death, the established government of Muscovy was a diarchy. From 1619 to 1633 there were two actual sovereigns, Tsar Michael and his father, the most holy Patriarch Philaret. Theoretically they were co-regents, but Philaret frequently transacted affairs of state without consulting the tsar. He replenished the treasury by a more equable and rational system of assessing and collecting the taxes. His most important

domestic measure was the chaining of the peasantry to the soil, a measure directed against the ever-increasing migration of the down-trodden serfs to the steppes, where they became free-booters instead of tax-payers. The taxation of the tsar's *slyuzhnuie lyudi*, or military tenants, was a first step towards the proportional taxation of the hitherto privileged classes. Philaret's zeal for the purity of orthodoxy sometimes led him into excesses; but he encouraged the publication of theological works, formed the nucleus of the subsequently famous Patriarchal Library, and commanded that every archbishop should establish a seminary for the clergy, himself setting the example. Another great service rendered by Philaret to his country was the reorganization of the Muscovite army with the help of foreign officers. His death in October 1633 put an end to the Russo-Polish War (1632–33), withdrawing the strongest prop from an executive feeble enough even when supported by all the weight of his authority.

PHILATELY (Gr. φίλος, loving, and ἀτελής, free of tax), the study and collection of postage-stamps and other marks of pre-payment issued by post-offices. The fancy for collecting postage-stamps began a short time after the issue of the first British penny and two-penny stamps in 1840 (see Post and Postal Service). Dr Gray, an official of the British Museum, began collecting them soon after their appearance, and an advertisement in an issue of *The Times* of 1841 asks for gifts of cancelled stamps for a young lady. In 1842 the new hobby was ridiculed in *Punch*. It was not until about 1860, however, that stamp collecting began to be systematically carried on with full regard to such *minutiae* as the different kinds of paper, water-marks, perforation, shade of colour and distinctive outline. About 1862 a teacher in Paris directed that foreign stamps should be collected and pasted upon the pages of his pupils' atlases and geographies according to countries, and this may have been the first form of the systematic classification of stamps in a collection. Of existing collections the oldest were begun between 1853 and 1860, by which year French collectors had assumed especial prominence. Professional dealers now made their appearance, and in 1861 philatelic literature, now of vast extent, was inaugurated by the publication in Strasburg of a catalogue of stamps issued up to that time. The Paris collectors were the first to classify stamps, measure them by the gauge, note the water-marks and separate the distinct issues of each country. Collecting with due regard to the relationship of different issues is called *plating*. The first English catalogue was issued in 1862, followed in December of the same year by *The Stamp Collector's Review and Monthly Advertiser*, published in Liverpool, the first philatelic periodical, the second, *The Stamp Collector's Magazine*, appearing in 1863. In 1863 also appeared *Le Timbre-Poste*, a Brussels journal. Up to 1910 over 800 philatelic periodicals had appeared.

Although small bodies of enthusiasts had banded together in England, France and the United States for the study and collection of postage-stamps as early as 1865, it was not until 1869 that the first great club, the *Philatelic Society of London*, still the most important in the world, was founded. Other societies in Great Britain are the *Junior Philatelic* of London, and those of Birmingham, Manchester, Edinburgh and Leith. The leading society in America is the American Philatelic Association; in France the *Société française de timbrologie*; in Germany the *Internationaler Philatelisten-Verein*. More than 400 such organizations are now in existence, the majority of them in the United States and Germany. At a philatelic congress, held in London in 1910, the formation of a universal union of philatelic societies "to discourage unnecessary or speculative issues" was considered.

Not only the stamps themselves were collected, but "entires," *i.e.* postcards, envelopes with the stamps still adhering, &c. Marks of prepayment at last became so numerous that, about 1880, specialists began to appear, who restricted their collections to the stamps of some particular country or continent, or to postcards or newspaper-wrappers alone. The most extensive and valuable stamp collection in the world, that of Baron P. von Ferrary of Paris, was begun about 1865. This collection, which cost its owner at least £250,000, contains a cancelled and an uncancelled specimen of each stamp. The next greatest collection is that bequeathed to the British nation in 1891 by T. K. Tapling, M.P., now in the British Museum. Among other important collections may be mentioned those in the German Postal Museum in Berlin, of King George V. of England, W. B. Avery, H. J. Duveen and the earl of Crawford. The largest sum realized for an entire collection was £27,500, which was paid for that of M. P. Castle, consisting of European stamps only. The value of a stamp depends partly upon its age, but much more upon its rarity, which again is dependent upon the number of the particular stamps originally issued. Most stamps have a quoted value, but some possess a conventional value only, such as those of which only one or two specimens are known to exist; for instance, the one-cent stamp of the 1856 issue of British Guiana (one known copy); the Italian 15 *centesimi* stamp of 1865 converted by an overprint into 20 *centesimi* (one copy); the Cape of Good Hope triangular, printed by mistake on paper intended for stamps of other colonies (four copies); and the 2 cent stamps of the earliest issue of British Guiana (ten copies). The best known of the very rare stamps are the 1d. and 2d. "Post-Office" Mauritius, for which higher prices have been paid than for any other stamps, although 23 copies are known to exist out of the 1000 issued. For a fine specimen of these Mauritius stamps £2000 has been offered. Two of them have been sold for £2400. Philatelic exhibitions such as those held in London in 1890 and 1897 and in Manchester in 1909 have proved popular.

"Reprints" are reimpressions, taken from the original plates, of obsolete stamps, and have a much smaller value than specimens of the original issue. Forgeries of the rarer stamps are common but are easily detected. Modern postage-stamp albums are often beautiful specimens of the printer's art, reproductions of every known stamp being given in the original colours.

PHILEMON (*c.* 361–263 B.C.), Greek poet of the New Comedy, was born at Soli in Cilicia, or at Syracuse. He settled at Athens early in life, and his first play was produced in 330. He was a contemporary and rival of Menander, whom he frequently vanquished in poetical contests. Posterity reversed the verdict and attributed Philemon's successes to unfair influence. He made a journey to the east, and resided at the court of Ptolemy, king of Egypt, for some time. Plutarch (*De Cohibenda Ira*, 9) relates that on his journey he was driven by a storm to Cyrene, and fell into the hands of its king Magas, whom he had formerly satirized. Magas treated him with contempt, and finally dismissed him with a present of toys. Various accounts of his death are given; a violent outburst of laughter, excess of joy at a dramatic victory, or a peaceful end while engaged in composing his last work (Apuleius, *Florida*, 16; Lucian, *Macrob.* 25; Plutarch, *An Seni*, p. 725). Of the ninety-seven plays which he is said to have composed, the titles of fifty-seven and considerable fragments have been preserved. Some of these may have been the work of his son, the younger Philemon, who is said to have composed fifty-four comedies. *The Merchant* and *The Treasure* of Philemon were the originals respectively of the *Mercator* and *Trinummus* of Plautus. The fragments preserved by Stobaeus, Athenaeus and other writers contain much wit and good sense. Quintilian (*Instit.* x. 1, 72)

assigned the second place among the poets of the New Comedy to Philemon; and Apuleius, who had a high opinion of him, has drawn a comparison between him and Menander.

See A. Meineke, *Menandri et Philemonis reliquiae* (1823, including Bentley's emendations); T. Kock, *Comicorum graecorum fragmenta* (1884), vol. iii.

PHILEMON, EPISTLE TO, a scripture of the New Testament. Onesimus, a slave, had robbed (*vv.* 11, 18–19) and run away from his master Philemon, a prosperous and influential Christian citizen of Colossae (Col. iv. 9), either offence rendering him liable to be crucified. Voluntarily or accidentally, he came across Paul, who won him over to the Christian faith. In the few tactful and charming lines of this brief note, the apostle sends him back to his master with a plea for kindly treatment. After greeting Philemon and his wife, with Archippus (possibly their son) and the Christians who met for worship at Philemon's house (*vv.* 1–2), Paul rejoices over (*vv.* 4–7) his correspondent's character; it encourages him to make an appeal on behalf of the unworthy Onesimus (8–21), now returning (Col. iv. 9) along with Tychicus to Colossae, as a penitent and sincere Christian, in order to resume his place in the household. With a line or two of personal detail (22–25) the note closes.

Rome would be a more natural rendezvous for fugitivarii (runaway slaves) than Caesarea (Hilgenfeld and others), and it is probable that Paul wrote this note, with Philippians and Colossians, from the metropolis. As Laodicea is close to Colossae it does not follow, even if Archippus be held to have belonged to the former town (as Lightfoot argues from Col. iv. 13–17), that Philemon's residence must have been there also (so A. Maier, Thiersch, Wieseler, &c.). Paul cannot have converted Philemon at Colossae (Col. ii. 1), but elsewhere, possibly at Ephesus; yet Philemon may have been on a visit to Ephesus, for, even were the Ephesian Onesimus of Ignatius (Eph. ii.) the Onesimus of this note, it would not prove that he had always lived there. No adequate reason has been shown for suspecting that the note is interpolated at any point. The association of Timotheus with Paul (*v.* 1) does not involve any official tinge, which would justify the deletion of *καὶ Τιμόθεος ὁ ἀδελφός μου* in that verse, and of *ἡμῶν* in *vv.* 1–2 (so Holtzmann), and Hausrath's suspicions of the allusion to Paul as a prisoner and of *v.* 12 are equally arbitrary. The construction in *vv.* 5–6 is difficult, but it yields to exegetical treatment (cf. especially Haupt's note), and does not involve the interpolation of matter by the later redactor of Colossians and Ephesians (Holtzmann, Hausrath [1] and Brückner, *Reihenfolge d. paul. Briefe*, 200 seq.).

The brevity of the note and its lack of doctrinal significance prevented it from gaining frequent quotation in the early Christian literature, but it appears in Marcion's canon as well as in the Muratorian, whilst Tertullian mentions, and Origen expressly quotes it. During the 19th century, the hesitation about Colossians led to the rejection of Philemon by some critics as a pseudonymous little pamphlet on the slave question—an aberration of literary criticism (reproduced in *Ency. Bib.* 3693 seq.) which needs simply to be chronicled. It is interesting to observe that, apart from the letter of commendation for Phoebe (Rom. xvi.), this is the only letter in the New Testament addressed, even in part, to a woman, unless the second epistle of John be taken as meant for an individual.

Bibliography.—In addition to most commentaries on Colossians and to Dr M. R. Vincent's edition of Philippians, compare special exegetical studies by R. Rollock (Geneva, 1602), G. C. Storr (1781), J. K. I. Demme, *Erklärung d. Philemon-Briefes* (1844); H. A. Petermann, *Ad fidem versionum . . . cum earum textu orig. graece* (Berlin, 1844); M. Rothe, *Pauli ad Philem. epistolae interpretatio historico-exegetica* (Bremen, 1844); and H. J. Holtzmann, *Zeitschrift für wissen. Theologie* (1873), pp. 428 sqq., besides the essays of J. G. C. Klotzsch, *De occasione et indole epistolae ad Philem.* (1792); D. H. Wildschut, *De vi dictionis et sermonis elegantia in epistola ad Philem.* (1809); and J. P. Esser, *Der Brief an Philemon* (1875). An up-to-date survey of criticism is furnished by Dr J. H. Bernard in Hastings's *Dictionary of the Bible*, iv. 832–834, and a good exposition may be found in Z. Weber's *Der Brief an d. Philemon, ein Vorbild für die christl. Behandlung sozialer Fragen* (1896), as well as in Dr A. H. Drysdale's devotional commentary (London, 1906). (J. Mf.)

PHILEMON and BAUCIS, the hero and heroine of a beautiful story told by Ovid (*Metam.* viii. 610–715), the scene of which is laid in Phrygia. Zeus, accompanied by Hermes, visited earth in human form; tired and weary, they sought shelter for the night, but all shut their doors against them except an aged couple living in a humble cottage, who afforded them hospitality. Before their departure the gods revealed themselves, and bade their hosts follow them to the top of a mountain, to escape the punishment destined to fall on the rest of the inhabitants. The country was overwhelmed by a flood; the cottage, which alone remained standing, was changed into a magnificent temple. The gods appointed Philemon and Baucis priest and priestess, and granted their prayer that they might die together. After many years they were changed into trees—Philemon into an oak, Baucis into a lime. The story, which emphasizes the sacred duty of hospitality, is probably of local Phrygian origin, put together from two widely circulated legends of the visits of gods to men, and of the preservation of certain individuals from the flood as the reward of piety. It lingers in the account (Acts xiv.) of the healing of the lame man by Paul at Lystra, the inhabitants of which identified Paul and Barnabas with Zeus and Hermes, "come down in the likeness of men."

Similar stories are given in J. Grimm, *Deutsche Mythologie* (Eng. trans., 1883, ii. 580, and iii. 38).

PHILES, MANUEL (*c.* 1275–1345), of Ephesus, Byzantine poet. At an early age he removed to Constantinople, where he was the pupil of Georgius Pachymeres, in whose honour he composed a memorial poem. Philes appears to have travelled extensively, and his writings contain much information concerning the imperial court and distinguished Byzantines. Having offended one of the emperors by indiscreet remarks published in a chronography, he was thrown into prison and only released after an abject apology. Philes is the counterpart of Theodorus Prodromus in the time of the Comneni; his character, as shown in his poems, is that of a begging poet, always pleading poverty, and ready to descend to the grossest flattery to obtain the favourable notice of the great. With one unimportant exception, his productions are in verse, the greater part in dodecasyllabic iambic trimeters, the remainder in the fifteen-syllable "political" measure.

Philes was the author of poems on a great variety of subjects: on the characteristics of animals, chiefly based upon Aelian and Oppian, a didactic poem of some 2000 lines, dedicated to Michael Palaeologus; on the elephant; on plants; a necrological poem, probably written on the death of one of the sons of the imperial house; a panegyric on John Cantacuzene, in the form of a dialogue; a conversation between a man and his soul; on ecclesiastical subjects, such as church festivals, Christian beliefs, the saints and fathers of the church; on works of art, perhaps the most valuable of all his pieces for their bearing on Byzantine iconography, since the writer had before him the works he describes, and also the most successful from a literary point of view; occasional poems, many of which are simply begging letters in verse.

Editions: the natural history poems in F. Lehrs and F. Dübner, *Poetae bucolici et didactici* (Didot series, 1846); Manuelis Philae *Carmina inedita*, ed. A. Martini (1900); Manuelis Philae *Carmina* ed. E. Miller (1855–1857). See also C. Krumbacher, *Geschichte der byzantinischen Litteratur* (1897).

PHILETAS of Cos, Alexandrian poet and critic, flourished in the second half of the 4th century B.C. He was tutor to the son of Ptolemy I. of Egypt, and also taught Theocritus and the grammarian Zenodotus. His thinness made him an object of ridicule; according to the comic poets, he carried lead in his shoes to keep himself from being blown away. Over-study of Megarian dialectic subtleties is said to have shortened his life. His elegies, chiefly of an amatory nature and singing the praises of his mistress Battis (or Bittis), were much admired by the Romans. He is frequently mentioned by Ovid and Propertius, the latter of whom imitated him and preferred him to his rival Callimachus, whose superior mythological lore was more to the taste of the Alexandrian critics. Philetas was also the author of a vocabulary called *Ἄτακτα*, explaining the meanings of rare

and obscure words, including words peculiar to certain dialects; and of notes on Homer, severely criticized by Aristarchus.

Fragments edited by N. Bach (1828), and T. Bergk, *Poetae lyrici graeci*; see also E. W. Maass, *De tribus Philetae carminibus* (1895).

PHILIDOR, FRANÇOIS ANDRÉ DANICAN (1726–1795), French composer and chess-player, was born at Dreux, on the 7th of September 1726, of a musical family. The family name was Danican, but that of Philidor, added in the middle of the 17th century, eventually supplanted the older name. François André received a musical education as a member of the corps of pages attached to the orchestra of the king; and subsequently he earned his living by giving lessons and copying music. Much of his time was, however, devoted to chess, at which he soon became an expert. He spent many years in travelling on the Continent and in England, meeting and defeating the most noted players of the time, and is regarded as the strongest player and greatest theoretician of the 18th century. Returning to France in 1754, he resolved to devote himself seriously to musical composition, and after producing several works of minor importance brought out at Paris, in the year 1759, his successful light opera, *Blaise le Savetier*, which was followed by a number of others, notably *Le Soldat magicien* (1760), *Le Jardinier et son seigneur* (1761), *Le Sorcier* (1762), and *Tom Jones* (1764). He died in London on the 31st of August 1795.

PHILIP (Gr. Φίλιππος, fond of horses, from φιλεῖν, to love, and ἵππος, horse; Lat. *Philippus*, whence *e.g.* M. H. Ger. *Philippes*, Dutch *Filips*, and, with dropping of the final s, It. *Filippo*, Fr. *Philippe*, Ger. *Philipp*, Sp. *Felipe*), a masculine proper name, popularized among the Christian nations as having been that of one of the apostles of Christ. Notices of distinguished men who have borne this name are arranged below in the following order: (1) Biblical; (2) Kings of Macedonia, France, Germany and Spain; (3) other rulers.

PHILIP, one of the twelve apostles, mentioned fifth in all the lists (Matt. x. 3; Mark iii. 18; Luke vi. 14; Acts i. 13). He is a mere name in the Synoptists, but a figure of some prominence in the Fourth Gospel. There he is said to have been "of Bethsaida, the city of Andrew and Peter," and to have received his call to follow Jesus at Bethany, having previously been, it would seem, a disciple of the Baptist (John i. 43, 44; cf. 28). Philip was at that time the means of bringing Nathanael to Jesus (John i. 45), and at a later date he, along with Andrew, carried the request of the inquiring Greeks to the Master (John xii. 22). Philip and Andrew alone are mentioned by name in connexion with the feeding of the five thousand (John vi. 5, 7), and Philip is also one of the few interlocutors in John xiv. Slight though these references are, all agree in presenting Philip as of an inquiring and calculating character, slow to take the initiative, but, when convinced of the path of duty, thoroughly loyal in following it. After the resurrection he was present at the election of Matthias as successor to Judas, but he does not again appear in the New Testament history; it is, however, implied that he still continued in Jerusalem after the outbreak of the first persecution.

Little reliance can be placed on the traditional accounts of Philip, owing to the evident confusion that had arisen between him and the evangelist of the same name, who appears in the book of Acts (see below). According to Polycrates, bishop of Ephesus, in his controversial letter written to Victor of Rome towards the end of the 2nd century (*ap.* Euseb. *H. E.* iii. 31, v. 24), the graves of Philip "of the twelve apostles," and of his two aged virgin daughters were in (the Phrygian) Hierapolis; a third daughter, "who had lived in the Holy Ghost," was buried at Ephesus. With this may be compared the testimony of Clement of Alexandria, who incidentally (*Strom.* iii. 6) speaks of "Philip the Apostle" as having begotten children and as having given daughters in marriage. On the other hand, Proclus, one of the interlocutors in the "Dialogue of Caius," a writing of somewhat later date than the letter of Polycrates, mentions (*ap.* Euseb. *H. E.*, iii. 31) "four prophetesses, the daughters of Philip at Hierapolis in Asia, whose tomb and that of their father are to be seen there," where the mention of the daughters *prophesying* identifies the person meant with the Philip of Acts (cf. Acts xxi. 8). The reasons for setting aside this latter identification, and for holding that the Philip who lived at Hierapolis was the Apostle are clearly stated by Lightfoot, Colossians (2) note 3, p. 45 seq., and fresh confirmation of his view has recently been afforded by the discovery of an inscription at Hierapolis, showing that the church there was dedicated to the memory "of the holy and glorious apostle and theologian Philip" (Ramsay, *Cities and Bishoprics of Phrygia*, vol. i. pt. ii. p. 552).

See also Corssen, "Die Töchter des Philippus" in the *Zeitschrift für die neutestamentliche Wissenschaft* (1901), pp. 289 sqq. The other view, that the Philip of Hierapolis is the Philip of Acts, is taken by Zahn, *Forschungen zur Geschichte des neutestamentlichen Kanons* (1900), vi. 158 sqq.

A later stage of the tradition regarding Philip appears in various late apocryphal writings which have been edited by Tischendorf in his *Acta apostolorum apocrypha*, and in his *Apocalypses apocryphae*. According to the *Acta Philippi*, a work belonging at the earliest to the close of the 4th century (see Zahn, *op. cit.* pp. 18 sqq.), Philip, with Bartholomew and his own sister Mariamne, exercised a widespread missionary activity, preaching not only throughout Asia Minor, but also in Hellas the city of the Athenians, in Scythia, and in Gaul, &c. According to one account he died a natural death; according to another he was hanged or crucified, head downwards. An apocryphal gospel, which describes the progress of the soul through the next world, bears his name (Hennecke, *Neutestamentliche Apokryphen*, 1904, p. 40 seq.).

Since the 6th century Philip has been commemorated in the West, along with St James the Less, on the 1st of May, their relics being deposited in the same church in Rome; in the Eastern Church Philip's day is the 14th of November, and that of James the Less the 23rd of October.

PHILIP, "the evangelist," is first mentioned in the Acts (vi. 5) as one of "the seven" who were chosen to attend to certain temporal affairs of the church in Jerusalem in consequence of the murmurings of the Hellenists against the Hebrews. After the martyrdom of Stephen he went to "the city of Samaria," where he preached with much success, Simon Magus being one of his converts. He afterwards instructed and baptized the Ethiopian eunuch on the road between Jerusalem and Gaza; next he was "caught away" by the Spirit and "found at Azotus" (Ashdod), whence "passing through he preached in all the cities till he came to Caesarea" (Acts viii.). Here some years afterwards, according to Acts xxi. 8, 9, where he is described as "the evangelist" (a term found again in the New Testament only in Eph. iv. 11; 2 Tim. iv. 5), he entertained Paul and his companion on their way to Jerusalem; at that time "he had four daughters which did prophesy." At a very early period he came to be confounded with the apostle Philip (see above); the confusion was all the more easy because, as an esteemed member of the apostolic company, he may readily have been described as an apostle in the wider sense of that word (see further Salmon, *Introd. to the New Testament*, 7th ed., p. 313 sqq.). A late tradition describes him as settling at Tralles in Asia Minor, where he became the overseer or ruler of the church. "Philip the deacon" is commemorated on the 6th of June.

PHILIP I., king of Macedonia, a semi-legendary prince, son of Argaeus, was, according to Herodotus (viii. 137–139) and Thucydides (ii. 100), the third of the Macedonian kings. In the texts of Dexippus and Eusebius he ranks sixth, Caranus, Coenus and Thurimas (or Turimmas) being there regarded as the predecessors of Perdiccas I., whom Herodotus and Thucydides regard as the first king of Macedonia. Eusebius and Dexippus assign to Philip I. a reign of 38 and 35 years respectively. There is, however, no real evidence for his existence. (E. R. B.)

PHILIP II. (382–336 B.C.), king of Macedonia, the son of Amyntas II. and the Lyncestian Eurydice, reigned 359–336. At his birth the Macedonian kingdom, including the turbulent peoples of the hill-country behind, was very imperfectly consolidated. In 370 Amyntas died, and the troubled reign of

Philip's eldest brother, Alexander II., was cut short in 368 by his assassination. His murderer, Ptolemy of Alorus, ruled as regent for the young Perdiccas, Amyntas's second son. In 367 Philip was delivered as hostage to the Thebans, then the leading power of Greece (by whom does not seem clear). During the three years he spent at Thebes the boy no doubt observed and learnt much. When he returned to Macedonia (364) Perdiccas had succeeded in getting rid of Ptolemy; but he fell in 360–359 before an onset of the hill tribes instigated by the queen-mother Eurydice, leaving only an infant son. Various pretenders sprang up and the kingdom fell into confusion. Philip seized the throne and drove back his rivals. He now began the great task of his life—the creation of the Macedonian national army. The first experiment he made with this new organism was brilliantly successful. The hill tribes were broken by a single battle in 358, and Philip established his authority inland as far as Lake Oehrida. In the autumn of the same year he took the Athenian colony, Amphipolis, which commanded the gold-mines of Mt Pangaeus. Their possession was all-important for Philip, and he set there the new city, called after him, Philippi. Athens was temporarily pacified by assurances that Amphipolis would be handed over to her later on. The work of fashioning the Macedonian army occupied Philip for the next few years, whilst his diplomacy was busy securing partisans within the states of Greece. He avoided as yet a forward policy, and having taken Pydna and Potidaea soon after Amphipolis, he made them over to the Olynthian confederation (see OLYNTHUS). His marriage with the fierce witch-woman, Olympias, daughter of the Epirote king, falls in this period, and in 356 she bore him his greater son, Alexander. In 353 Philip was ready for strong action. He first attacked Abdera and Maronea, on the Thracian sea-board, and then took Methone, which belonged to Athens. An overt breach with Athens was now inevitable. In the same summer he invaded Thessaly, where the Aleuadae of Larissa ranged themselves on his side against the *tagus* Lycophron, "tyrant" of Pherae. Pherae called in the help of the Phocian mercenaries, who had profaned Delphi, and Philip met with a check. He had, however, the advantage of now being able to present himself to the Greeks as the champion of Apollo in a holy war, and in 352 the Macedonian army won a complete victory over the Pheraeans and Phocians. This battle made Philip *tagus* of Thessaly, and he claimed as his own Magnesia, with the important harbour of Pagasae. Hostilities with Athens did not yet take place, but Athens was threatened by the Macedonian party which Philip's gold created in Euboea.

From 352 to 346 Philip did not again come south. He was active in completing the subjugation of the Balkan hill-country to the west and north, and in reducing the Greek cities of the coast as far as the Hebrus (Maritza). For the chief of these, indeed, Olynthus, he continued to profess friendship till its neighbour cities were in his hands. Then, in 349, he opened war upon it. Athens, to whom Olynthus appealed, sent no adequate forces, in spite of the upbraidings of Demosthenes (see his *Olynthiacs*), and in the spring of 347 Olynthus fell. Philip razed it to the ground (see OLYNTHUS). Macedonia and the regions adjoining it having now been securely consolidated, Philip celebrated his "Olympian" games at Dium. In 347 Philip advanced to the conquest of the eastern districts about the Hebrus, and compelled the submission of the Thracian prince Cersobleptes. Meanwhile Athens had made overtures for peace (see the *De falsa legatione* of Demosthenes), and when Philip, in 346, again moved south, peace was sworn in Thessaly. The time was come for Philip to assert himself in Greece, and the Phocians, who still dominated Delphi and held Thermopylae, could furnish a pretext to the champion of Pan-Hellenism and Apollo. The Phocian mercenaries at Thermopylae were bought off and Philip crossed into central Greece. Here he made Thebes his ally and visited the Phocians with crushing vengeance. The Pythian games of 346 were celebrated at the delivered Delphi under Philip's presidency. Pan-Hellenic enthusiasts already saw Philip as the destined captain-general of a national crusade against Persia (Isocrates, *Philippus*, about 345). And such a position Philip had determined to secure: the Macedonian agents continued to work throughout the Greek states, and in the Peloponnesus Sparta soon found herself isolated. Euboea, too, submitted to Macedonian influence, and even received some garrisons. But more work had to be done in the Balkan highlands. In 344, or one of the following years, the Macedonian arms were carried across Epirus to the Adriatic. In 342 Philip led a great expedition north "comparable to nothing in antiquity since Darius' famous march to Scythia." In 341 his army was still campaigning in eastern Thrace, when Philip felt compelled to show his presence in Thessaly. During these years, although Athens had not overtly broken the peace of 346, there had been various diplomatic bickerings and hostile intrigues between the two powers (cf. the *Philippics* of Demosthenes). Athens had even sent emissaries to the Persian court to give warning of the proposed national crusade. She now egged on the cities of the Propontis (Byzantium, Perinthus, Selymbria), who felt themselves threatened by Philip's Thracian conquests, to declare against him. The sieges of Perinthus and Byzantium (340, 339) ended in Philip's meeting with a signal check, due in some measure to the help afforded the besieged cities by Athens and her allies. Philip's influence all over Greece was compromised. But before marching south he led another expedition across the Balkans into the country now called Bulgaria, and returned to Pella with much spoil but severely wounded in the thigh. In 338 he once more crossed into central Greece. The pretext was the contumacy shown by the Locrian town Amphissa to the rulings of the Amphictyonic Council. Philip's fortification of Elatea filled Athens with alarm. Thebes was induced to join Athens; so were some of the minor Peloponnesian states, and the allies took the field against Philip. This opposition was crushed by the epoch-making battle of Chaeronea, which left Greece at Philip's feet. In the following year (337) Philip was in the Peloponnesus, and a congress of the Greek states at the Isthmus (from which, however, Sparta held sullenly aloof) recognized Philip as captain-general for the war against Persia. Philip returned to Macedonia to complete his preparations; an advanced force was sent into Asia in the spring of 336. But Philip's plans were suddenly blasted by his assassination in the same year during the marriage festival of his daughter at Aegae, the old capital of Macedonia. He left, however, in the Macedonian army a splendid instrument which enabled his son within ten years to change the face of the world.

Philip stands high among the makers of kingdoms. Restless energy, determination, a faculty for animating and organizing a strong people, went with unscrupulous duplicity and a full-blooded vehemence in the pleasures of sense. Yet Philip was not untouched by ideal considerations, as is proved by the respect, no doubt sincere, which he showed for Hellenic culture, by the forbearance and deference with which he treated Athens, the sacred city of that culture and his mortal foe. A special interest belongs to the Macedonian kingdom as it was shaped by Philip, since it forestalls a system which was not to find the time ripe for it in European history till many centuries later—the national kingdom quickened with the culture developed by the ancient city-states. The national kingdoms founded by the Northern races, after the fall of the Roman Empire, under the influence of the classical tradition, are the beginnings of the modern European system; Philip of Macedon foreshadows Theodoric, Charlemagne and William the Conqueror. But this first national kingdom within the sphere of Greek culture could not ultimately live between the surge of the Northern barbarians and the Roman power.

See the authorities under GREECE: *History*. A vivid and masterly sketch of Philip's personality and work is given in D. G. Hogarth's *Philip and Alexander* (1897). (E. R. B.)

PHILIP III. [ARRHIDAEUS], king of Macedonia, was the feeble-minded son of Philip II. of Macedonia by a Thessalian wife. He was chosen by the Macedonian army at Babylon in 323 to be nominal king conjointly with the infant Alexander, and was killed in Macedonia by order of Olympias (317). (See MACEDONIAN EMPIRE.)

PHILIP IV., king of Macedonia, was the son of Cassander, king of Macedonia: he reigned only one year (297–296).

PHILIP V., king of Macedonia, son of Demetrius II. and Chryseis, was an infant at his father's death in 230–229. His cousin, Antigonus Doson, administered the kingdom as regent till his death in 221–220, when Philip was eighteen years old. Philip now ascended the throne and reigned till 179. His reign was occupied in the vain struggle to maintain the old Macedonian supremacy in the Balkan Peninsula, which became hopeless after the intervention of Rome and the decisive battle of Cynoscephalae (197). See ROME: *History*, § II. "The Republic" (period B, § h). (E. R. B.)

PHILIP I. (1052–1108), king of France, eldest son of Henry I. of France and Anne, daughter of Jaroslav I. (d. 1054), grand duke of Kiev, came to the throne, when a child of eight, by the death of his father on the 4th of August 1060. He had been crowned at Reims, in the presence of a number of magnates, on the 23rd of May 1059. Philip passed most of his early years in and around Paris, where the castles of lawless barons, such as that of Montlhéry, threatened even his personal safety. His minority came to an end in 1066. In the long reign that followed he showed no great ability or energy, and a looseness of morals which embroiled him with the Church. Before he was fifty years of age he became "fond of nothing but good cheer and sleep." But he increased the lands of his house around Paris, maintained order in them, and held his own against William I. and William II. of England, whose power in France far exceeded his own. This he accomplished for the most part by taking advantage of the quarrels among his vassals. When Baldwin VI. of Flanders died, in 1070, his son Arnulf was attacked by his uncle Robert the Frisian, count of Holland. Philip interfered, at the prayer of Arnulf's mother, Richildis; but the allies were defeated near Cassel on the 22nd of February 1071 and Arnulf was slain. After a second war peace was sealed, apparently, by the marriage of Philip to Robert's step-daughter Bertha, daughter of Gertrude of Saxony and Florence, count of Holland. In 1074 a new rupture led to Philip seizing Corbie, part of the dower of his aunt Adèle, who had married Baldwin IV. of Flanders. By this he secured a sort of outpost in the direction of Flanders. The other main episodes of his reign were the quarrel over the Angevin inheritance and his wars with the dukes of Normandy. In the struggle between Fulk Rechin and his brother Geoffrey the Bearded for the inheritance of their uncle, Geoffrey Martel (d. 1060), count of Anjou, Philip received from Fulk in 1069, as the price of his neutrality, Château Landon and the Gatinais. This acquisition linked the county of Sens, acquired in 1055, with the rest of the domain round Paris, Melun and Orleans. War with William I. was chronic but intermittent. In 1076 Philip forced him to raise the siege of Dol in Brittany. Peace was made in 1077, and in December 1079 they together besieged Robert Curthose in the castle of Gerberoy. On the 8th of May 1080 the siege was raised and peace made. War with William began again in 1081 over the county of Vexin, which Philip had seized on the retirement of its count, Simon of Valois, to a monastery in 1076. William demanded reparation for the raid of Philip's vassals and the cession of Pontoise, Chaumont-en-Vexin and Mantes, but died after sacking Mantes in the same year. In 1098 there was war between Philip and William Rufus in both Maine and the Vexin. William came in person from Maine to lead the attack in the Vexin in September, and crossed the Seine, penetrating to within 30 m. of Paris on the west; but the campaign brought no results. In his last years Philip left the duty of repelling the attacks of his Norman and other enemies to his son Louis, associating him with himself, as "king-designate," some time between the 24th of May 1098 and the 25th of September 1100.

It was his second marriage which was the cause of Philip's greatest difficulties. On the 15th of May 1092 he carried off Bertrada, daughter of Simon, baron de Montfort, wife of Fulk Rechin, and prepared to marry her, though his wife Bertha was still living. The bishops, headed by Ivo, bishop of Chartres, refused to attend the ceremony of marriage, but one was found to perform it. Philip's open simony had long been a cause of friction with the papacy. When he added bigamy and adultery, Urban II. excommunicated him. The bishop of Chartres, in consequence, refused to bring his vassals to help Philip's ally, Robert, duke of Normandy, against his brother William in 1094. Bertha died in that year, but Fulk was still living, and the sentence was renewed at the Council of Autun on the 15th of October. Philip replied by summoning the bishops to Paris to try Ivo of Chartres for treason. He gained a respite from the papal sentence by promises of submission, but the sentence was renewed by Urban at the Council of Clermont in 1095, in 1096, and in 1097, and at Poitiers in 1101, despite the protest of William IX., count of Poitiers, who entered the church with his knights to prevent his suzerain from being excommunicated on his lands. Philip was reconciled with the Church in 1104, and took an oath not to have any converse or society with Bertrada except in the presence of "non-suspect" persons. But they seem to have gone on living together, and even visited Fulk Rechin (Bertrada's husband) in company on the 15th of October 1106. Philip died at the end of July 1108.

His reign is chiefly remarkable for the steady growth of the royal domain. In addition to the gains mentioned, he bought in 1101 a large slice of territory, including Bourges and Dun-le-Roi, from Eudes Arpin, viscount of Bourges, who was going on the crusade; and toward the end of his reign took Montlhéry, whose lord beset the southern approach to Paris. By his first queen he had four children: Louis VI., who succeeded him; Henry, who died young; Charles; and Constance, who married Hugh I., count of Champagne, and later Bohemund I., prince of Antioch. By Bertrada de Montfort he had three children: Philip, count of Montes; Fleury or Florus, who married the heiress of Nangis; and Cecilia, who married, first Tancred, prince of Galilee and Antioch, and secondly Pons de Saint Gilles, count of Tripoli.

The materials for the reign of Philip I. are in the *Recueil des historiens des Gaules et de la France*, vols. xi.–xvi. See especially the critical examination by Dom Brial of the historians who have spoken of Philip I. at the beginning of vol. xvi. Consult also E. A. Freeman, *Norman Conquest*, iv., *passim*, and *William Rufus*, ii. 165–302; A. Luchaire, *Louis le Gros* (Paris, 1890), and "Les Premiers Capetiens" in E. Lavisse's *Histoire de France* (II. ii. pp. 168–175). More recent is the *Recueil des actes de Philippe I.*, edited by M. Pron (1908), and B. Monod's *Essai sur les rapports de Pascal II. avec Philippe I.* (Paris, 1907). For notices of the principal chronicles of the time see A. Molinier, *Les Sources de l'histoire de France* (II., esp. p. 307 et seq.).

PHILIP II. (1165–1223), known as PHILIP AUGUSTUS, king of France, son of Louis VII. and Adela, daughter of Theobald II., count of Champagne, was born on the 21st of August 1165. On the 1st of November 1179 he was associated with his father as king by being crowned at Reims, and at once his father's illness threw the responsibility of government on him, the death of Louis on the 19th of September 1180 leaving him sole king.

The boy-king found himself and his kingdom in a difficult and humiliating position. His long strip of royal domain was hemmed in by the Angevin Empire on the west and by the kingdom of Arles on the south-east. Henry II. of England was feudal lord of the greater part of France, practically all west of a line which began at Dieppe and ended at the foot of the Pyrenees more than half-way across to the Mediterranean, while at one point it nearly touched the Rhone. Philip's predecessors had consolidated the Capetian power within these narrow limits, but he himself was overshadowed by the power of his uncles, William, archbishop of Reims; Henry I., count of Champagne; and Theobald V., count of Blois and Chartres. He secured an ally against them, and an addition to the royal domain, by marrying, on the 28th of April 1180, Isabella or Elizabeth, daughter of Baldwin V., count of Hainaut, and of Marguerite, sister of Philip of Alsace, the reigning count of Flanders, who ceded Arras, St Omer, Aire and Hesdin, and their districts, as Isabella's dowry, a district afterwards called Artois. On the 28th of June 1180 Philip made a treaty with Henry II. at Gisors, and his reign thus opened auspiciously. But from 1181 to 1185 he had to struggle against a feudal league of his Champagnard uncles and other great

barons, whose most active member was Stephen I., count of Sancerre (1152–1191). Though attacked from both north and south, the king's activity enabled him to compel the count of Sancerre to implore peace in 1181. On the death of Isabel of Vermandois, wife of Count Philip of Flanders, in 1182, Philip claimed Vermandois and seized Chauné and St Quentin, and forced his father-in-law, Baldwin of Hainaut, to support him by threatening to divorce Queen Isabel. The count of Flanders was obliged to sign the treaty of Boves in July 1185, which gave the king, in addition to the expectation of Artois, his wife's dower, sixty-five castles in Vermandois and the town of Amiens. By 1186 Hugh, duke of Burgundy, the only member of the coalition not yet subdued, was forced to submit. Then, secure at home, the king turned against Henry II., and by the truce of Châteauroux in June 1187, gained Issoudun and the seigniory of Fréteval in the Vendômois. Though the truce was for two years, Philip assembled an army in 1188 to invade Normandy, demanding Gisors and the conclusion of the marriage which had been arranged between his sister Alice and Richard of England, who had meanwhile deserted his father. But the news came that Saladin had taken Jerusalem and Richard took the cross. Shortly afterwards Philip took advantage of a rising against his quondam friend Richard, who was duke of Aquitaine, to seize the county of Berry. At a conference at Bonmoulins on the 18th of November Richard again abandoned his father, and after a second conference at La Ferté Bernard, Philip invaded Maine and forced Henry II. to conclude the treaty of Azay on the 4th of July 1189, by which the English king did homage and surrendered the territories of Graçy and Issoudun. Henry died two days later. Pledges of mutual good faith and fellowship were renewed between Philip and Richard of England on the 30th of December 1189, and they both prepared to go on the crusade.

Before setting out Philip arranged for the government of France during his absence by his famous testament of 1190, by which he proposed to rule France as far as possible from Palestine. The power of the regents, Adela, the queen-mother, and William, archbishop of Reims, was restricted by a council composed mostly of clerks who had the king's confidence. An annual report on the state of the kingdom was to be sent him. On the way to Palestine the two kings quarrelled. At the siege of Acre Philip fell ill, and on the 22nd of July, nine days after its fall, he announced his intention of returning home. He reached Paris at Christmas 1191, having concluded on his way an alliance with the emperor Henry VI. against Richard, despite his pledges not to molest his lands. When Leopold I., duke of Austria, took Richard prisoner and delivered him to the emperor, Philip did his utmost by offers of money to prolong his captivity, and, allied with the English king's brother John, attacked Richard's domains, but upon Richard's return the Normans rallied enthusiastically to his aid. Philip was defeated at Fréteval on the 3rd of July 1194, but he continued the war, generally with ill success, for the next five years. Again a formidable coalition was formed against him, including Baldwin IX., count of Flanders and Hainaut, Renaud of Dammartin, count of Boulogne, Louis, count of Blois, and Raymond VI., count of Toulouse. In Germany, Otto of Brunswick, afterwards the emperor Otto IV., allied himself with Richard, while Philip was supported by Otto's rival, Philip of Swabia. Richard's death, in April 1199, removed his arch-enemy, and Richard's successor, John, concluded the treaty of Le Goulet with Philip on the 22nd of May 1200, ceding to him the county of Evreux, Graçy and Issoudun, and the suzerainty of Berry and Auvergne. John renounced his suzerainty over Brittany and the guardianship of his nephew, Arthur; he engaged not to aid the count of Flanders or Otto IV. without Philip's consent, paid him a relief of 20,000 marks, and recognized himself as his vassal for his continental fiefs. Philip's son Louis, afterwards Louis VIII., married Blanche of Castile, John's niece. But in 1202 the war was renewed, John having seized some castles from the family of Lusignan, whose head was the count of La Marche, and taken for his queen a prospective bride, Isabelle Taillefer, from Hugh, son of Hugh IX., count of La Marche. At an interview at Le Goulet on the 25th of March, Philip demanded the cession of Anjou, Poitou and Normandy to his ward, Arthur. John refused; he was summoned to Paris before the royal judges, and failing to appear was sentenced at the end of April 1202 to lose all his fiefs. Brittany, Aquitaine and Anjou were conferred on Arthur. Philip invaded Normandy, took Lyons-la-Forêt and Eu, and, establishing himself in Gournay, besieged Arques. But John, joined by William des Roches and other lords of Maine and Poitou, jealous at the increase of Philip's power, defeated and took Arthur prisoner at Mirebeau. Philip abandoned the siege of Arques in a fit of fury, marched to the Loire, burning everywhere, and then returned to Paris. But John soon alienated the Poitevin barons, and William des Roches signed a treaty with Philip on the 22nd of March 1203. Then Philip continued his great task, the conquest of Normandy, capturing the towns around the fortress of Château-Gaillard which Richard had built to command the valley of the Seine. Pope Innocent III. tried to bring about peace, but Philip was obdurate, and after murdering Arthur of Brittany John took refuge in England in December 1203. The fall of Château-Gaillard, after a siege which lasted from September 1203 to April 1204, decided the fate of Normandy. Rouen, bound by ties of trade to England, resisted for forty days; but it surrendered on the 24th of June 1204. The conquest of Maine, Touraine, Anjou and Poitou in 1204 and 1205 was little more than a military promenade, though the castles of Loches and Chinon held out for a year. Philip secured his conquest by lavishing privileges on the convents and towns. He left the great lords, such as William des Roches, in full possession of their feudal power. In 1206 he marched through Brittany and divided it amongst his adherents. A truce for two years was made on the 26th of October 1206 by which John renounced all claims in Normandy, Maine, Brittany, Touraine and Anjou, but it did not last six months. Then Poitou was thoroughly subdued, and another truce was made in 1208, little more than southern Saintonge and Gascony being left in the hands of John. Philip had reduced to a mere remnant the formidable continental empire of the Angevins, which had threatened the existence of the Capetian monarchy.

Philip then undertook to invade England. In the assembly of Soissons on the 8th of April 1213 he made every preparation for carrying out the sentence of deposition pronounced by the pope against John. He had collected 1500 vessels and summoned all his barons when Innocent III., having sufficiently frightened John, sent Pandulf with the terms of submission, which John accepted on the 13th of May.

Disappointed of his hopes of England, Philip turned his arms against Ferdinand, count of Flanders. Ferdinand, son of Sancho I., king of Portugal, owed his county to Philip, who, hoping to find him a docile protégé, had married him to Jeanne, heiress of Flanders, daughter of Count Baldwin IX., who became emperor of the East, using the weak Philip of Namur, her guardian, to accomplish that end. They were married in January 1212. On the morrow of the marriage Louis, afterwards Louis VIII., seized Aire and St Omer in right of his mother, Isabella, and on this account Ferdinand refused his feudal duty in the English expedition. Moreover, the trade interests of his subjects, who got their raw wool from England, drew him to an alliance with England. Philip's attack brought this about on the 22nd of May 1213. He invaded Flanders and took the chief towns within a week; but he had part of his fleet burned by the English at Damme, and had to burn the rest to save it from falling into their hands. He returned to Paris, and Ferdinand retook most of the towns which had been taken by the king. A war of fire and pillage began, in which Philip and his son Louis burned their way through Flanders, and Ferdinand did the same through Artois.

In 1214 came the great crisis of Philip's life. All the forces against which he had been struggling united to overwhelm him. Paris was to be attacked from Flanders and Guienne at the same time. A league including his rebel vassals, Renaud of Dammartin, count of Boulogne, and Ferdinand, count of Flanders, with the emperor Otto IV. and a number of German princes of the Rhine region, had been formed in the north-east, while John of England

made one more attempt to recover his heritage at the head of an army of mercenaries aided by the fickle baronage of Poitou. John landed at La Rochelle on the 16th of February 1214, and was at first successful. On the 19th of June he laid siege to La Roche-aux-Moines, the fortress which defended Angers and commanded the Loire valley; but on the approach of a royal army under Prince Louis on the 2nd of July his Poitevin barons refused to risk a pitched battle, and he fled hastily to La Rochelle. The Angevin Empire in France was lost. Meanwhile Philip himself won his greatest victory at the bridge of Bouvines, among the morasses of Flanders. At first taken by surprise, he turned the abortive attack into a complete rout. Renaud and Ferdinand were taken prisoner, and Otto IV. fled from the battlefield. The army of the allies was utterly destroyed (July 27, 1214). Nothing shows the progress of the Capetian monarchy more than the enthusiasm and joy of the people of France, as described by William the Breton, over this crowning victory. The battle of Bouvines, a decisive battle for the history of Germany as well as for France and England, sealed the work of Philip Augustus. The expedition of his son Louis to conquer England can hardly be considered as an incident of his reign, though he was careful to safeguard the rights of the French Crown. More important was the Albigensian crusade, in which he allowed Louis to take part, though he himself, preoccupied with the king of England, had refused time after time to do anything. He treated Simon de Montfort as if he were a royal *bailli*; but it was not in virtue of any deep-laid scheme of his that in the end Amaury de Montfort, Simon's son, resigned himself to leave his lands to the Crown of France, and gave the Crown a power it had never before possessed in Languedoc.

Even more than by his conquests Philip II. marks an epoch in French history by his work as an organizer and statesman. He surrounded himself with clerks and legists of more or less humble origin, who gave him counsel and acted as his agents. His *baillis*, who at first rather resembled the itinerant justices of Henry II. of England, were sent into the royal domain to supervise the conduct of the *prévôts* and hear complaints, while in the newly acquired lands in the south local feudal magnates were given similar powers with the title of *sénéchal*. Feudal service was more and more compounded for by a money payment, while additional taxes were raised, all going to pay the mercenaries with whom he fought Richard I. and John. The extension of the system of *sauvegarde*, by which abbeys, towns or lay vassals put themselves under the special protection of the king, and that of *pariage*, by which the possessor surrendered half the interest in his estate to the king in return for protection or some further grant, increased the royal power. The small barons were completely reduced to submission, whilst the greater feudatories could often appoint a castellan to their own castles only after he had taken an oath to the king. Philip supported the clergy against the feudal lords, and in many cases against the burgesses of the towns, but rigidly exacted from them the performance of their secular duties, ironically promising to aid the clergy of Reims, who had failed to do so, "with his prayers only" against the violence of the lords of Rethel and Roucy. He clung to his right of *regale*, or enjoyment of the revenues of bishoprics during their vacancy, though it was at times commuted for a fixed payment. The attempt to raise a tithe for the crusade in 1189 failed, however, before a general resistance owing to an unfair assessment.

It has been said with some justice that Philip II. was the first king of France to take the bourgeoisie into partnership. He favoured the great merchants, granting them trade privileges and monopolies. The Jews he protected and plundered by turns, after the fashion of medieval kings. Amongst the subject towns administered by *prévôts* a great extension of the "custom of Lorris" took place during his reign. But it is as the ally and protector of the communes that he takes his almost unique place in French history. Before him they were resisted and often crushed; after him they were exploited, oppressed, and finally destroyed. In the case of Senlis he extended the jurisdiction of the commune to all crimes committed in the district. It is true that he suppressed some communes in the newly conquered fiefs, such as Normandy, where John had been prodigal of privileges, but he erected new communes in his own private domain, quite contrary to the custom of other kings. He seems to have regarded them as a kind of garrison against feudal unruliness, while the rents they furnished increased his financial resources. He created no new types of commune, however, except Peronne, which received a maximum of political independence, the twenty-four electors, who named the *jurés* and other officers, being elected by the *corps de métiers*.

The newly organized powers of the Crown were in evidence everywhere, interfering in the family affairs of the great feudatories and taking advantage of minorities, such as that of Theobald IV. of Champagne. The great feudatories accepted his legislation on dower in 1214 and 1219 and the *établissement* of 1209 making co-heirs of fiefs hold direct from the king and not from one of their number. The Tournois was substituted for the Angevin money in Normandy after 1204. The army which safeguarded this active monarchy consisted chiefly of mercenaries. The old feudal *ost* was but rarely convoked. The communes, though they appear as taking part in the battle of Bouvines, compounded for their service by a money payment as early as 1194.

Philip's policy of building up a strong monarchy was pursued with a steadiness of aim which excluded both enthusiasm and scruple. But he seems to have prided himself on a certain humanity, or even generosity of temper, which led him to avoid putting his enemies to death, though he did not scruple to condemn Renaud of Dammartin to the most inhuman of imprisonments. He was impulsive and could display extraordinary activity at times, but he possessed also a certain coldness and caution. He shrank from no trickery in carrying out his ends, and had no room for pity. He could not even trust his own son with any power, and was brutal in his relations with his queen, Ingeborg. He is described by Paiën Gâtineau as "a well-knit, handsome man, bald (from his illness at Acre), of agreeable face and ruddy complexion, loving good cheer, wine and women. Generous to his friends, he was miserly to those who displeased him; very skilled in the art of the engineer, catholic in his faith, far-seeing, obstinate in his resolution. His judgment was sound and quick. He was also quick in his anger, but easily appeased." As the result of his steadiness of aim and patient sagacity, at the end of his reign the Crown was victorious over the feudal nobility and the royal domain extended to the frontiers along with royal authority. Artois, the Amienois, Valois, Vermandois, the greater part of the Beauvaisis, Normandy, Maine, Anjou, Touraine, and an important part of Poitou and Saintonge, were added to the domain during his reign. The number of *prévôtés* was increased from thirty-eight to ninety-four, and the royal revenue increased from 19,000 livres a month to 1200 livres a day.

Philip Augustus died on the 14th of July 1223. He was thrice married. His first wife, Isabella, by whom he had one son, Louis, died in 1189 or 1190. After her death he married Ingibjörg or Ingeborg (*q.v.*), daughter of Valdemar I. of Denmark. This unlucky marriage was negotiated, it is said, chiefly to acquire the old claims of Denmark over England, to be used as a weapon against Richard I. However that may be, he soon repudiated this Danish princess, for whom he seems to have conceived an unconquerable aversion on the very morrow of his marriage to her, and in 1196, in defiance of the pope, who had refused to nullify his union with Ingeborg, married Agnes, daughter of Bertold IV., duke of Meran. This led to his excommunication and brought the interdict upon France, and did more to weaken him than any other act of his. In 1200 he was forced to put away Agnes and to recognize Ingeborg as his lawful wife, but he kept her in prison until 1213. By Agnes (d. 1201) he had a son Philip, called "Hurepel," count of Clermont, and a daughter Mary, who married Philip, count of Namur (d. 1213), and then Henry II., duke of Brabant. Ingeborg lived until 1236.

See A. Luchaire in E. Lavisse's *Histoire de France*, tome iii. 83–284 (Paris, 1904), and literature there indicated; L. Deslisle, *Catalogue des actes de Philippe Auguste* (Paris, 1856 and 1901); A. Cartellieri, *Philip II. August*, Bd. I. *Bis zum Tode Ludwigs VII.*

(Leipzig, 1899), Bd. II. *Der Kreuzzug* (1906); and W. H. Hutton, *Philip Augustus* (in the "Foreign Statesmen Series," London, 1896). A. Molinier, *Les Sources de l'histoire de France* (tome iii. pp. 1–38), gives a complete bibliography of the sources for Philip's reign, including the history of the Third Crusade.

PHILIP III. (1245–1285), surnamed "the Bold" (*le Hardi*), king of France, son of Louis IX. and Margaret, daughter of Raymond Bérenger IV., count of Provence, was born on the 3rd of April 1245. His funeral monument at St Denis depicts a man with beardless, square-cut features, but lacking character and animation. The authenticity of this effigy is fairly well borne out by what is known of him from other sources. He had many of the virtues of St Louis, but neither decision of character nor devotion to duty. He was pious, charitable, of unimpeachable morality, quick-tempered but placable, no great scholar, and only energetic as a hunter. The absence in him of the qualities that fit a man to rule made his court the arena of intriguing factions, which in reality ruled France during his reign of fifteen years. Matthew of Vendôme, abbot of St Denis, an old servant of Louis IX., acted as Philip's counsellor, so the chroniclers state, throughout the reign; but he is only a shadowy figure, and it is difficult to reconcile the statement that "everything was done according to his will" with the known facts. It was probably with administration, and not policy, that Matthew was chiefly concerned. In one instance at least his advice was openly flouted. Coming to the throne by the death of his father on the 25th of August 1270, Philip began his reign by falling entirely under the influence of Pierre de la Brosse, who had been surgeon and valet-de-chambre to his father, upon whom he lavished lands and honours, making him lord (sieur) of Langeais, Chatillon-sur-Indre and Damville. Even Edward I. of England and William Dampierre, count of Flanders, strove to win his favour by gifts. But his fall was assured when Philip, who in 1271 lost his first wife, Isabella, daughter of James I., king of Aragon, married in 1274 Marie, daughter of Henry III., duke of Brabant. She was young and beautiful, and supplied a centre round which those who wished the downfall of the favourite grouped themselves. In June 1278 he was charged with various crimes, including one of poisoning the king's eldest son, and hanged at Montfaucon. His death left the parties of Marie, the queen, and Margaret, the queen-mother, to struggle for the mastery. The first subject of dispute was the inheritance of the count of Provence, Raymond-Bérenger IV., father of Margaret and of Eleanor, wife of Henry III. of England. Upon his death, in 1245, his youngest daughter, Beatrice, wife of Charles of Anjou, the king's uncle, succeeded to his lands, to the exclusion of her elder sisters, who claimed some portion of them for themselves. In 1281 war nearly broke out on this question. Margaret and her friends formed the league of Mâcon against Charles of Anjou, but the king managed to keep them at peace. The settlement of the claims of the king of England in Aquitaine by the treaty of Amiens in 1279 was a victory for the party of Margaret.

Agenais and southern Saintonge, which fell to the Crown by the death of Alfonse of Poitiers in 1276, as part of his vast possessions in Aquitaine and Languedoc, were ceded to Edward I. of England in accordance with the treaty of Paris 1259. Another portion of the heritage of Alfonse, the Venaissin, was ceded to the papacy to redeem an old promise. In general the strong will of Charles of Anjou directed Philip's policy. He secretly urged his nephew's candidature for the imperial crown, left vacant by the death of Richard of Cornwall, king of the Romans, in 1272, but without success. In May 1275 the party of Marie secured for Philip, the king's second son, the hand of Jeanne, the heiress of Navarre and Champagne, along with the guardianship of the kingdom of Navarre during the minority of Jeanne. But early in 1276 Jeanne's mother, Blanche, the widow of Henry III. of Navarre and Champagne, married Edmund, first earl of Lancaster, brother of Edward I.; and she and her English husband kept Champagne until, in 1284, Jeanne came of age.

An expedition of Philip against Castile in aid of the children of his sister, Blanche, proved abortive. Regardless of this warning, he was induced in 1284 to take up the quarrel of his uncle Charles in Sicily, after the Sicilian Vespers in 1282. Two assemblies of barons and prelates were held at Bourges in November 1283 and February 1284 to deliberate on the question. This was a mere matter of form; Marie of Brabant and her party had decided the matter beforehand, and the crown of Aragon, which the French pope Martin IV. had declared forfeited by Peter, was accepted for Charles of Valois, Philip's third son. The project was strongly opposed by Matthew of Vendôme, who was in correspondence with the king of England on the subject. It was the first warlike expedition undertaken by the house of Capet outside France. It proved a disastrous failure. The French army laid siege to Gerona on the 26th of June 1285. The town surrendered on the 7th of September, but disease and the defeat of the fleet by the Aragonese navy at Las Farmiguas Islands led to a retreat, during which, on the 5th of October, the king died. In the same month the garrison placed at Gerona surrendered. It is typical of Philip's character and career that he should die thus, in an expedition undertaken against the interests of his kingdom, at the instigation of his ambitious uncle.

Philip was twice married. On the 28th of May 1262 he married Isabella, daughter of James I., king of Aragon, who died in 1271. By her he had four children: Louis, who died in 1276; Philip, born in 1268; Charles of Valois, born on the 12th of March 1270; and Robert, who died young. By his second wife, Marie (d. 1322), daughter of Henry III. of Brabant, whom he married in 1274, he had three children: Louis, count of Evreux; Margaret, who married in 1299 Edward I., king of England; and Blanche, who married Rudolph III., duke of Austria.

Walter, *Die Politik der Kurie unter Gregor X.* (Berlin, 1894); Registers of Gregory X. and Nicholas III., published by the French school at Rome; R. Sternfeld, *Ludwigs des Heiligen Kreuzzug nach Tunis und die Politik Karls I. von Sizilien* (1896); P. Fournier, *Le Royaume d'Arles* (Paris, 1891). For complete bibliography of sources see A. Molinier, *Les Sources de l'histoire de France*, tome iii. 171–187 (Paris, 1903).

PHILIP IV. (1268–1314), called "*le Bel*" or "the Fair," king of France, was the son of Philip III. and his wife, Isabella of Aragon. His reign, which began in October 1285, is one of the most momentous in the history of medieval Europe, yet it belongs rather to the history of France and to that of the papacy than to the biography of the king. Little is known of the personal part played by Philip in the events associated with his name, and later historians have been divided between the view which regards him as a handsome, lethargic nonentity and that which paints him as a master of statecraft who, under a veil of phlegmatic indifference and pious sentiment, masked an inflexible purpose, of which his ministers were but the spokesmen and executors. The first view seems to be borne out by the language of contemporary chroniclers. To his enemy, Bernard Saisset, he was neither man nor beast, but a statue, "the handsomest man in the world, but unable to do anything but stare fixedly at people without saying a word." Guillaume de Nogaret, his minister, draws a far more flattering picture, enlarging on his charm, his amiability, his modesty, his charity to all men, and his piety; and the traits of this over-coloured portrait are more or less repeated by Yves, a monk of St Denis. There is, however, no word of any qualities of will or initiative. All of which suggests a personality mentally and physically phlegmatic, a suggestion strengthened by the fact that Bartholomaeus de Neocastro (quoted by Wenck) describes him as corpulent in 1290.

Yet this was the king who with equal implacability brought the papacy under his yoke, carried out the destruction of the powerful order of the Temple, and laid the foundations of the national monarchy of France. In this last achievement Professor Finke finds the solution of a problem which Langlois had declared to be insoluble. In 1302, in the midst of a hostile assembly, Philip cursed his sons should they consent to hold the Crown of any one but God [1]; and in this isolated outburst he sees the key to his character. "Philip was not a man of violent initiative, the planner of daring and fateful operations; otherwise there

[1] Wenck, p. 49.

would have been some signs of it. His personality was that of a well-instructed, outwardly cold, because cool and calculating man, essentially receptive, afire for only one idea: the highest possible development of the French monarchy, internally and externally, as against both the secular powers and the Church. His merit was that he carried through this idea in spite of dangers to himself and to the state. A resolution once arrived at he carried out with iron obstinacy." Certainly he was no *roi fainéant*. His courage at the battle of Mons-en-Pévèle was the admiration of friend and foe alike. It was against the advice of his tutor, Aegidius Colonna, that on coming to the throne he chose as his counsellors men of the legal class, and the names of his great ministers—Guillaume de Nogaret, Enguerrand de Marigny, Pierre Flotte (d. 1302)—attest the excellent quality of his judgment. He was, too, one of the few monarchs who have left to their successors reasoned programmes of reform for the state.

The new materials from the Aragonese archives, published by Finke, give the same general impression of "uncanny" reticence on Philip's part; when other contemporary kings would have spoken he keeps silence, allowing his ministers to speak for him. Isolated passages in some of the Aragonese letters included in the collection, however, throw a new light on contemporary estimate of his character, describing him as all-powerful, as "pope and king and emperor in one person." [1]

The reign of Philip IV. is of peculiar interest, because of the intrusion of economic problems into the spheres of national politics and even of religion. The increased cost of government and the growing wealth of the middle class, rather than the avarice of the king and the genius of his ministers, were responsible for the genesis and direction of the new order. The greatest event of the reign was the struggle with Pope Boniface VIII. (*q.v.*). The pope, in his opposition to the imposition of royal taxation upon the clergy, went so far in the bull *Clericis laicos* of 1296 as to forbid any lay authority to demand taxes from the clergy without his consent. When Philip retaliated by a decree forbidding the exportation of any coin from France, Boniface gave way to save the papal dues, and the bulls issued by him in 1297 were a decided victory for the French king. Peace between the two potentates followed until 1301. After the arrest, by Philip's orders, of Bernard Saisset (*q.v.*), bishop of Pamiers, in that year, the quarrel flamed up again; other causes of difference existed, and in 1302 the pope issued the bull *Unam sanctam*, one of the most extravagant of all statements of papal claims. To ensure the support of his people the king had called an assembly of the three estates of his kingdom at Paris in April 1302; then in the following year Guillaume de Nogaret seized the person of the pope at Anagni, an event immortalized by Dante. Boniface escaped from his captors only to die (October 11), and the short pontificate of his saintly successor, Benedict XI., was occupied in a vain effort to restore harmony to the Church. The conclave that met at Perugia on his death was divided between the partisans of the irreconcilable policy of Boniface VIII. and those of a policy of compromise with the new state theories represented by France. The election was ultimately determined by the diplomacy and the gold of Philip's agents, and the new pope, Clement V., was the weak-willed creature of the French king, to whom he owed the tiara. When in 1309 the pope installed himself at Avignon, the new relation of the papacy and the French monarchy was patent to the world. It was the beginning of the long "Babylonish captivity" of the popes. The most notable of its first-fruits was the hideous persecution of the Templars (*q.v.*), which began with the sudden arrest of the members of the order in France in 1307, and ended with the suppression of the order by Pope Clement at the council of Vienne in 1313.

It is now tolerably clear that Philip's motives in this sinister proceeding were lack of money, and probably the deliberate wish to destroy a body which, with its privileged position and international financial and military organization, constituted a possible menace to the state. He had already persecuted and plundered the Jews and the Lombard bankers, and repeated recourse to the debasing of the coinage had led to a series of small risings. But under his rule something was done towards systematizing the royal taxes, and, as in England, the financial needs of the king led to the association of the people in the work of government.

In 1294 Philip IV. attacked Edward I. of England, then busied with the Scottish War, and seized Guienne. Edward won over the counts of Bar and of Flanders, but they were defeated and he was obliged to make peace in 1297. Then the Flemish cities rose against the French royal officers, and utterly defeated the French army at Courtrai in 1302. The reign closed with the French position unimproved in Flanders, except for the transfer to Philip by Count Robert of Lille, Douai and Béthune, and their dependencies. Philip died on the 29th of November 1314. His wife was Jeanne, queen of Navarre (d. 1304), through whom that country passed under the rule of Philip on his marriage in 1284; three of his sons, Louis X., Philip V. and Charles IV., succeeded in turn to the throne of France, and a daughter, Isabella, married Edward II. of England.

PHILIP V. (*c.* 1294–1322), "the Tall," king of France, second son of Philip the Fair and Jeanne of Navarre, received the county of Poitiers as an apanage, and was affianced when a year old to Jeanne, daughter and heiress of Otto IV., count of Burgundy. The marriage took place in 1307 when he was thirteen years of age. When his elder brother, Louis X., died, on the 5th of July 1316, leaving his second wife, Clemence of Hungary, with child, Philip was appointed regent for eighteen years by the parliament of Paris, even in the event of a male heir being born. Clemence's son, born on the 15th of November, lived only four days, and Philip immediately proclaimed himself king, though several of the great barons declared that the rights of Jeanne, daughter of Louis X. by his first wife, Margaret of Burgundy, ought to be examined before anything else was done. The coronation at Reims, on the 9th of January 1317, took place with the gates of the city closed for fear of a surprise. The states-general of the 2nd of February 1317, consisting of the nobles, prelates, and the burgesses of Paris, approved the coronation of Philip, swore to obey him, and declared that women did not succeed to the Crown of France. The university of Paris approved this declaration, but its members did not take the oath. The Salic law was not involved, and it was later that the lawyers of the 14th century tried to connect this principle to an article of the Salic law, which accords inheritance in land (*i.e.* property) to males. In the Frankish law the article refers to private property, not to public law. The death of Philip's son Louis, in 1317, disarmed the opposition of Charles, count of La Marche, who now hoped to succeed to the Crown himself. Odo or Eudes IV., duke of Burgundy, was married to Jeanne, Philip's daughter, and received the county of Burgundy as her dower. The barons all did homage except Edward II. of England, and Philip's position was secured. The war with Flanders, which had begun under Philip IV. the Fair, was brought to an end on the 2nd of June 1320. The revolt of the Pastoureaux who assembled at Paris in 1320 to go on a crusade was crushed by the seneschal of Carcassonne, whither they marched. One of the special objects of their hatred, the Jews, were also mulcted heavily by Philip, who extorted 150,000 livres from those of Paris alone. He died at Longchamp on the night of the 2nd of January 1322.

Philip was a lover of poetry, surrounded himself with Provençal poets and even wrote in Provençal himself, but he was also one of the most hard-working kings of the house of Capet. The

[1] Finke, ii. no. 78, p. 122. Anon. to the commanderies of Gardeyne and Ascho: "Pus el es rey et papa et emperador! Car tot lo mon sap, quel papa no es negun et que el fa tot ço ques vol del papa et de la esglea."

insecurity of his position made him seek the support of national assemblies and of provincial estates. His reign in some ways resembled that of Edward I. of England. He published a series of ordinances organizing the royal household and affecting the financial administration, the "parlement" and the royal forests. He abolished all garrisons in the towns except those on the frontier and provided for public order by allowing the inhabitants of his towns to arm themselves under the command of captains. He tried hard to procure a unification of coinage and weights and measures, but failed owing to the opposition of the estates, who were afraid of the new taxation necessary to meet the loss involved in raising the standard of the coinage, and who held to their local measures and currency partly from conservatism, partly as a relic of local liberty. Philip as a reformer was in many ways before his time, but his people failed to understand him, and he died under the reproach of extortion.

See P. Lehugeur, *Histoire de Philippe le Long* (Paris, 1897); E. Lavisse, *Histoire de France* (tome iii., 2); and sources indicated in A. Molinier, *Répertoire des sources de l'histoire de France* (Paris, 1903).

PHILIP VI. (1293–1350), king of France, was the son of Charles of Valois, third son of Philip III., the Bold, and of Margaret of Sicily, and was thus the nephew of Philip IV., the Fair, whose sons Louis X., Philip V. and Charles IV., died successively without leaving male heirs. He succeeded to the throne on the death of his cousin, Charles IV., in 1328. Before his accession Philip had enjoyed considerable influence, for he was count of Valois, Anjou, Maine, Chartres and Alençon. He had married in 1313 Jeanne (d. 1348), daughter of Robert II. of Burgundy, a determined woman who was long known as the real ruler of France. An expedition to Italy in 1319–20 against Galéas Visconti brought him little glory; he was more successful in a small expedition to Guienne, undertaken against a revolted vassal who was supported by the English.

When Charles IV. died, in February 1328, his wife was enceinte, and it became necessary to appoint a regency until the birth of the child, who would, if a son, succeed to the throne. At the assembly of barons called to choose a regent, Edward III. of England, the nephew and nearest male relation of Charles IV., put in a claim. Edward III., however, descended from the royal house of France by his mother Isabel, and the barons, probably actuated by an objection to the regency of an English king, decided that neither a woman, "nor by consequence her son, could succeed to the kingdom of France," and Philip of Valois, in spite of his belonging to a junior branch of the family, was elected regent. On the birth of a girl to the queen widow the regency naturally led to the throne of France, and Philip was crowned at Reims on the 29th of May 1328. Navarre had not accepted the regency, that kingdom being claimed by her husband for Jeanne, countess of Evreux, the eldest daughter of Louis X., the count of Evreux himself being, like Philip of Valois, a grandson of Philip the Bold. The new king secured the friendship of the count by allowing Jeanne's claim to Navarre, in return for a renunciation of any right to Champagne. Edward III. of England, after more than one citation, tendered verbal homage for part of Guienne at Amiens in 1329, but he declined to place his hands between those of Philip VI., and thus formally to acknowledge him as his liege lord. Two years later, however, he forwarded the acknowledgment by letters patent. Meanwhile Philip VI. had won a victory, which he turned into a massacre, at Cassel (August 23, 1328) over Bruges and the other towns of West Flanders, which under the leadership of Jakob van Artevelde had thrown off the authority of their count, Louis of Nevers. The count of Flanders was reinstated, and maintained his authority by a reign of terror.

Much harm was done to Philip VI.'s authority by the scandal arising out of the prosecution of Robert of Artois, count of Beaumont, who was the king's brother-in-law. The count had presented to the parlement of Paris forged deeds in support of his claim to the county of Artois, held by his aunt, Mahaut, countess of Burgundy. The sudden death of Mahaut, and of her daughter and heiress, Jeanne, widow of Philip V., lent colour to other suspicions, and Robert was driven from France and his goods confiscated. He found refuge, first in Brabant and then at the English court, where he was received as a relative and a victim of false accusations.

Philip VI. enjoyed powerful alliances. In Italy he was allied with his uncle, Robert of Anjou, king of Sicily, and with his former enemy, Galéas Visconti; in the north with the duke of Brabant and the princes of the Netherlands; on the east with the reigning princes of Lorraine and Savoy; with the king of Bohemia and with Pope John XXII. at Avignon, and his successor, Benedict XII. In 1336 it seemed that the Crusade, for which Philip VI. had long been preparing, would at last start; but the relations with Edward III. of England, which had always been strained, became worse, and within a year France was embarked on the struggle of the Hundred Years' War. The causes which led to war, the conflict for commercial supremacy in Flanders, disputed rights in Guienne, the help given by France to the Scots, and the unnatural situation of an English king who was also a vassal of the French Crown are dealt with elsewhere (see FRANCE: *History*). The immediate rupture in Flanders was due chiefly to the tyranny of the count of Flanders, Louis of Nevers, whom Philip VI. had reinstated. Edward III. had won over most of Philip's German and Flemish allies, and the English naval victory at Sluys (June 24, 1340), in which the French fleet was annihilated, effectually restored English preponderance in Flanders. A truce followed, but this was disturbed after a short duration by the disputed succession to the duchy of Brittany. Edward III. supported John of Montfort; Philip IV. his own nephew, Charles of Blois. A truce made at Malestroit in 1343 at the invitation of the pope, was rudely broken by Philip's violence. Olivier de Clisson, who with fourteen other Breton gentlemen, was suspected of intrigue with Edward III., was invited to a great tournament in Paris. On their arrival they were seized by Philip's orders, and without form of trial beheaded. Then followed Edward III.'s invasion of Normandy and the campaign of Creçy (*q.v.*). Philip's army was destroyed; he himself was wounded and fled from the field. He sought in vain to divert Edward from the siege of Calais by supporting the Scots in their invasion of England; but eventually a truce was arranged, which lasted until 1351. Philip VI. died at Nogent-le-roi on the 12th of August 1350.

Philip VI. met his necessities by the imposition of the hated gabelle or salt tax, which was invented by his legal advisers. The value of the coinage fluctuated continuously, to the great hindrance of trade; and although at a meeting of the States-General it was asserted that the king could levy no extraordinary taxes without the consent of the estates, he obtained heavy subsidies from the various provinces. Towards the close of his reign he acquired from Humbert II., comte de Vienne, the province of Dauphiné, and Montpellier from the king of Majorca. These acquisitions made the ultimate annexation of Provence a certainty. Philip married a second wife, Blanche of Navarre. By his first wife he left two sons—his successor, John II., and Philip of Orleans, count of Valois.

(1837), edition by Paulin Paris; E. Déprez, *Les Préliminaires de la guerre de cent ans, 1328–1342* (Paris, 1902), based on texts from the English Record Office and the Vatican; Paul Viollet, *Histoire des institutions politiques de la France*, vol. ii. (Paris, 1898); and E. Lavisse, *Hist. de France*, vol. iv. pt. i. (1902), by A. Colville. Further references will be found in Nos. 3095–3112 and 3165–3240 of A. Molinier's *Sources de l'histoire de France*, vol. iv. (Paris, 1904).

PHILIP (*c.* 1177–1208), German king and duke of Swabia, the rival of the emperor Otto IV., was the fifth and youngest son of the emperor Frederick I. and Beatrix, daughter of Renaud III., count of Upper Burgundy, and consequently brother of the emperor Henry VI. He entered the church, was made provost of Aix-la-Chapelle, and in 1190 or 1191 was chosen bishop of Würzburg. Having accompanied his brother Henry to Italy in 1191, Philip forsook his ecclesiastical calling, and, travelling again to Italy, was made duke of Tuscany in 1195 and received

an extensive grant of lands. In 1196 he became duke of Swabia, on the death of his brother Conrad; and in May 1197 he married Irene, daughter of the eastern emperor, Isaac Angelus, and widow of Roger II., king of Sicily, a lady who is described by Walther von der Vogelweide as "the rose without a thorn, the dove without guile." Philip enjoyed his brother's confidence to a very great extent, and appears to have been designated as guardian of the young Frederick, afterwards the emperor Frederick II., in case of his father's early death. In 1197 he had set out to fetch Frederick from Sicily for his coronation when he heard of the emperor's death and returned at once to Germany. He appears to have desired to protect the interests of his nephew and to quell the disorder which arose on Henry's death, but events were too strong for him. The hostility to the kingship of a child was growing, and after Philip had been chosen as defender of the empire during Frederick's minority he consented to his own election. He was elected German king at Mühlhausen on the 8th of March 1198, and crowned at Mainz on the 8th of September following. Meanwhile a number of princes hostile to Philip, under the leadership of Adolph, archbishop of Cologne, had elected an anti-king in the person of Otto, second son of Henry the Lion, duke of Saxony. In the war that followed, Philip, who drew his principal support from south Germany, met with considerable success. In 1199 he received further accessions to his party and carried the war into his opponent's territory, although unable to obtain the support of Pope Innocent III., and only feebly assisted by his ally Philip Augustus, king of France. The following year was less favourable to his arms; and in March 1201 Innocent took the decisive step of placing Philip and his associates under the ban, and began to work energetically in favour of Otto. The two succeeding years were still more unfavourable to Philip. Otto, aided by Ottakar I., king of Bohemia, and Hermann I., landgrave of Thuringia, drove him from north Germany, thus compelling him to seek by abject concessions, but without success, reconciliation with Innocent. The submission to Philip of Hermann of Thuringia in 1204 marks the turning-point of his fortunes, and he was soon joined by Adolph of Cologne and Henry I., duke of Brabant. On the 6th of January 1205 he was crowned again with great ceremony by Adolph at Aix-la-Chapelle, though it was not till 1207 that his entry into Cologne practically brought the war to a close. A month or two later Philip was loosed from the papal ban, and in March 1208 it seems probable that a treaty was concluded by which a nephew of the pope was to marry one of Philip's daughters and to receive the disputed dukedom of Tuscany. Philip was preparing to crush the last flicker of the rebellion in Brunswick when he was murdered at Bamberg, on the 21st of June 1208, by Otto of Wittelsbach, count palatine in Bavaria, to whom he had refused the hand of one of his daughters. He left no sons, but four daughters; one of whom, Beatrix, afterwards married his rival, the emperor Otto IV. Philip was a brave and handsome man, and contemporary writers, among whom was Walther von der Vogelweide, praise his mildness and generosity.

Abel, *König Philipp der Hohenstaufen* (Berlin, 1852); *Regesta imperii. V.*, edited by J. Ficker (Innsbruck, 1881); R. Schwemer, *Innocenz III. und die deutsche Kirche während des Thronstreites von 1198–1208* (Strassburg, 1882); and R. Riant, *Innocent III., Philippe de Souabe, et Boniface de Montferrat* (Paris, 1875).

PHILIP I., the Handsome (1478–1506), king of Spain, son of the emperor Maximilian I., and husband of Joanna the Mad, daughter of Ferdinand and Isabella, was the founder of the Habsburg dynasty in Spain, and was born at Bruges on the 22nd of July 1478. In 1482 he succeeded to the Burgundian possessions of his mother Mary, daughter of Charles the Bold, under the guardianship of his father. In 1496 he married Joanna. The marriage was one of a set of family alliances with Austria and Portugal designed to strengthen Spain against France. The death of John, the only son of Ferdinand and Isabella, opened the succession to the Spanish Crown to Joanna. In 1502 she and her husband received the homage of the cortes of Castile and of Aragon as heirs. Philip returned to Flanders before the close of the year. His life with Joanna was rendered extremely unhappy by his infidelity and by her jealousy, which, working on a neurotic temperament, precipitated her insanity. The princess gave way to paroxysms of rage, in which she was guilty of acts of atrocious violence. Before her mother's death, in 1504, she was unquestionably quite insane, and husband and wife lived apart. When Isabella died, Ferdinand endeavoured to lay hands on the regency of Castile, but the nobles, who disliked and feared him, forced him to withdraw. Philip was summoned to Spain, where he was recognized as king. He landed, with his wife, at Corunna on the 28th of April 1506, accompanied by a body of German mercenaries. Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

in Italy, Naples and Sicily, of the Burgundian inheritance—the Netherlands and Franche-Comté, and of the duchy of Milan, which his father separated from the empire for his benefit. It was a legacy of immense responsibilities and perils, for France was bound in common prudence to endeavour to ruin a power which encircled her on every side save the sea and threatened her independence. France was for a time beaten at the battles of St Quentin and Gravelines, and forced to make the Peace of Cateau Cambrésis (April 2, 1559). But the death of Mary of England on the 17th of November 1558 had deprived Philip of English support. The establishment of Elizabeth on the English throne put on the flank of his scattered dominions another power, forced no less than France by unavoidable political necessities to be his enemy. The early difficulties of Elizabeth's reign secured him a deceitful peace on that side for a time. His marriage with Elizabeth of Valois on the 22nd of June 1559, and the approach of the wars of religion, gave him a temporary security from France. But the religious agitation was affecting his own Flemish possessions, and when Philip went back to Spain, in August 1559, he was committed to a life-long struggle in which he could not prove victorious except by the conquest of France and England.

If Philip II. had deserved his name of the Prudent he would have made haste, so soon as his father, who continued to intervene in the government from his retreat at Yuste in Estremadura, was dead, to relieve himself of the ruinous inheritance of the Low Countries. It was perhaps impossible for him to renounce his rights, and his education, co-operating with his natural disposition, made it morally impossible for him to believe that he could be in the wrong. Like the rest of his generation, he was convinced that unity of religion was indispensable to the maintenance of the authority of the State and of good order. Family pride, also, was carried by him to its highest possible pitch. Thus external and internal influences alike drove him into conflict with the Netherlands, France and England; with the first because political and religious discontent combined to bring about revolt, which he felt bound in duty to crush; with the second and third because they helped the Flemings and the Hollanders. The conflict assumed the character of a struggle between Protestantism and Roman Catholicism, in which Philip appeared as the champion of the Church. It was a part he rejoiced to play. He became, and could not but become, a persecutor in and out of Spain; and his persecutions not only hardened the obstinacy of the Dutch, and helped to exasperate the English, but they provoked a revolt of the Moriscoes, which impoverished his kingdom. No experience of the failure of his policy could shake his belief in its essential excellence. That whatever he did was done for the service of God, that success or failure depended on the inscrutable will of the Almighty and not on himself, were his guiding convictions, which he transmitted to his successors. The "service of God and his majesty" was the formula which expressed the belief of the sovereign and his subjects. Philip must therefore be held primarily responsible for the insane policy which brought Spain to ruin. He had a high ideal of his duty as a king to his own people, and had no natural preference for violent courses. The strong measures he took against disorderly elements in Aragon in 1591 were provoked by extreme misconduct on the part of a faction. When he enforced his claim to the crown of Portugal (1579–1581) he preferred to placate his new subjects by paying attention to their feelings and their privileges. He even made dangerous political concessions to secure the support of the gentry. It is true that he was ready to make use of assassination for political purposes; but he had been taught by his lawyers that he was "the prince," the embodied state, and as such had a right to act for the public good, *legibus solutus*. This was but in accordance with the temper of the times. Coligny, Lord Burghley and William the Silent also entered into murder plots. In his private life he was orderly and affectionate to his family and servants. He was slow to withdraw the confidence he had once given. In the painful episode of the imprisonment and death of his firstborn son, Don Carlos, Philip behaved honourably. He bore the acute agony of the disease which killed him with manly patience, and he died piously at the Escorial on the 13th of September 1598.

As an administrator Philip had all the vices of his type, that of the laborious, self-righteous man, who thinks he can supervise everything, is capable of endless toil, and jealous of his authority, and who therefore will let none of his servants act without his instructions. He set the example of the unending discussions in committee and boundless minute writing which finally choked the Spanish administration.

The *Histoire de Philippe II.* of M. H. Forneron (Paris, 1881), contains many references to authorities and is exhaustive, but the author has some violent prejudices. *Philip II.*, by Martin Hume (London, 1897), is more just in its treatment of Philip's personal character, and gives a useful bibliography. The main sources for the political history are the *Documentos Inéditos para la historia de España* (Madrid, 1842, &c.), vols. i., iii., vi., vii., xv., xxi., xxiv., xl., xcviii., ci., ciii., cx., cxi. and others; L. P. Gachard, *Actes des états généraux des Pays Bas, 1576–1585* (Brussels, 1861–1866); and the *Calendars of State Papers, Foreign Series, Elizabeth* (London, 1863–1901). See also Martin Hume, *Two English Queens and Philip* (1908).

PHILIP III. (1578–1621), king of Spain, son of Philip II. and his fourth wife, Anne, daughter of the emperor Maximilian II., was born at Madrid on the 14th of April 1578. He inherited the beliefs of his father, but no share of his industry. The old king had sorrowfully confessed that God had not given him a son capable of governing his vast dominions, and had foreseen that Philip III. would be led by his servants. This calculation was exactly fulfilled. The new king put the direction of his government entirely into the hands of his favourite, the duke of Lerma, and when he fell under the influence of Lerma's son, the duke of Uceda, in 1518, he trusted himself and his states to the new favourite. The king's own life was passed amid court festivities, on which enormous sums of money were wasted, or in the practice of childish piety. It was said that he was so virtuous as hardly to have committed a venial sin. He cannot be justly blamed for having been born to rule a despotic monarchy, without even the capacity which would have qualified him to manage a small estate. He died at Madrid on the 31st of March 1621. The story told in the memoirs of the French ambassador Bassompierre, that he was killed by the heat of a *brasero* (a pan of hot charcoal), because the proper official to take it away was not at hand, is a humorous exaggeration of the formal etiquette of the court.

R. Watson and W. Thompson, *History of Philip III.* (1786), give the most available general account of his reign; see also the continuation of Mariana's *History of Spain* by Miñana (Madrid, 1817–1822).

PHILIP IV. (1605–1665), king of Spain, eldest son of Philip III. and his wife Margaret, sister of the emperor Ferdinand II., was born at Valladolid on the 8th of April 1605. His reign, after a few passing years of barren successes, was a long story of political and military decay and disaster. The king has been held responsible for the fall of Spain, which was, however, due in the main to internal causes beyond the control of the most despotic ruler, however capable he had been. Philip certainly possessed more enegy, both mental and physical, than his father. There is still in existence a translation of Guicciardini which he wrote with his own hand in order to qualify himself for government by acquiring a knowledge of political history. He was a fine horseman and keen hunter. His artistic taste was shown by his patronage of Velasquez, and his love of letters by his favour to Lope de Vega, Calderon, and other dramatists. He is even credited, on fairly probable testimony, with a share at least in the composition of several comedies. His good intentions were of no avail to his government. Coming to the throne at the age of sixteen, he did the wisest thing he could by allowing himself to be guided by the most capable man he could find. His favourite, Olivares, was a far more honest man than the duke of Lerma, and was more fit for the place of prime minister than any Spaniard of the time. But Philip IV. had not the strength of mind to free himself from the influence of Olivares when he had grown to manhood. The amusements which the favourite had encouraged became the business of the

an extensive grant of lands. In 1196 he became duke of Swabia, on the death of his brother Conrad; and in May 1197 he married Irene, daughter of the eastern emperor, Isaac Angelus, and widow of Roger II., king of Sicily, a lady who is described by Walther von der Vogelweide as "the rose without a thorn, the dove without guile." Philip enjoyed his brother's confidence to a very great extent, and appears to have been designated as guardian of the young Frederick, afterwards the emperor Frederick II., in case of his father's early death. In 1197 he had set out to fetch Frederick from Sicily for his coronation when he heard of the emperor's death and returned at once to Germany. He appears to have desired to protect the interests of his nephew and to quell the disorder which arose on Henry's death, but events were too strong for him. The hostility to the kingship of a child was growing, and after Philip had been chosen as defender of the empire during Frederick's minority he consented to his own election. He was elected German king at Mühlhausen on the 8th of March 1198, and crowned at Mainz on the 8th of September following. Meanwhile a number of princes hostile to Philip, under the leadership of Adolph, archbishop of Cologne, had elected an anti-king in the person of Otto, second son of Henry the Lion, duke of Saxony. In the war that followed, Philip, who drew his principal support from south Germany, met with considerable success. In 1199 he received further accessions to his party and carried the war into his opponent's territory, although unable to obtain the support of Pope Innocent III., and only feebly assisted by his ally Philip Augustus, king of France. The following year was less favourable to his arms; and in March 1201 Innocent took the decisive step of placing Philip and his associates under the ban, and began to work energetically in favour of Otto. The two succeeding years were still more unfavourable to Philip. Otto, aided by Ottakar I., king of Bohemia, and Hermann I., landgrave of Thuringia, drove him from north Germany, thus compelling him to seek by abject concessions, but without success, reconciliation with Innocent. The submission to Philip of Hermann of Thuringia in 1204 marks the turning-point of his fortunes, and he was soon joined by Adolph of Cologne and Henry I., duke of Brabant. On the 6th of January 1205 he was crowned again with great ceremony by Adolph at Aix-la-Chapelle, though it was not till 1207 that his entry into Cologne practically brought the war to a close. A month or two later Philip was loosed from the papal ban, and in March 1208 it seems probable that a treaty was concluded by which a nephew of the pope was to marry one of Philip's daughters and to receive the disputed dukedom of Tuscany. Philip was preparing to crush the last flicker of the rebellion in Brunswick when he was murdered at Bamberg, on the 21st of June 1208, by Otto of Wittelsbach, count palatine in Bavaria, to whom he had refused the hand of one of his daughters. He left no sons, but four daughters; one of whom, Beatrix, afterwards married his rival, the emperor Otto IV. Philip was a brave and handsome man, and contemporary writers, among whom was Walther von der Vogelweide, praise his mildness and generosity.

Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

at Avignon in 1395 in the hope of obtaining a voluntary resignation from him. But the growing influence of the king's brother, Louis of Orleans, who was on terms of great intimacy with Queen Isabel and was accused of being her lover, was a serious obstruction. Discord broke out in the council, and but for the intervention of the dukes of Berry and Bourbon the two princes would have come to an open struggle. For a brief period Philip was dispossessed of authority, but he regained it in 1402 and kept it till his death, which took place on the 27th of April 1404. The cathedral of St Bénigne at Dijon contains his remains, and his tomb (formerly in the Chartreuse of Dijon) is now in the museum in the Hôtel-de-ville.

Although he had to curb the independent spirit of the seigneurs of Franche-Comté, and in spite of frequent collisions with his vassals in Flanders and with the citizens of Besançon (who in 1386 extracted from him a promise to respect their privileges), Philip appears to have governed his territories with sagacity and a certain moderation, and he was particularly successful in employing the resources of France in the interests of Burgundy. He granted numerous privileges to the inhabitants of Dijon, and created in 1386 two *chambres des comptes*, one at Dijon and the other at Lille. He was, in the phrase of a contemporary, "kindly and amiable to high and low and those of middle rank, liberal as an Alexander, noble and pontifical, in court and state magnificent." But his liberality and his love of display involved him in enormous expense, and he left so many debts that his widow was compelled to renounce her personal estate to avoid the responsibility of discharging them. By his wife Margaret (d. 1405) he had a numerous family: John the Fearless, who succeeded him; Charles and Louis, who both died in infancy; Anthony, count of Rethel, and Philip count of Nevers, both killed at Agincourt; Margaret, who married William of Bavaria, count of Ostrevant; Catherine, wife of Leopold, duke of Austria; Mary, wife of Amadeus VIII. of Savoy; and Bonne, who was betrothed to John of Bourbon and died young. (R. Po.)

PHILIP THE GOOD (1396–1467), duke of Burgundy, son of John the Fearless, duke of Burgundy, and Margaret of Bavaria, was born at Dijon on the 13th of June 1396, and succeeded his father on the 10th of September 1419. The natural outcome of the assassination of John the Fearless (*q. v.*) was to drive his successor to the English side. In 1419 Philip signed with Henry V. of England the Treaty of Arras, by which he recognized Henry as regent and future heir of the kingdom of France, and in 1420 gave his adherence to the Treaty of Troyes. Early in December 1420 Philip entered Paris with the king of England, and subsequently took part in the defeat of the French at Mons-en-Vimeu. By a treaty concluded by Philip at Amiens in April 1423 with the dukes of Brittany and Bedford, John, duke of Bedford, married Philip's sister Anne, and Arthur of Brittany, earl of Richmond, became the husband of Philip's sister Margaret. A few years later discord arose among the allies. When the duke of Bedford besieged Orleans the inhabitants offered to surrender, but to the duke of Burgundy; whereupon Bedford retorted that "he did not beat the bushes for others to take the birds." When this speech reached Philip's ears he withdrew his troops in dudgeon, and concluded a truce with France (1429). Bedford, however, succeeded in conciliating him by promises and presents, and in 1430 Philip took part in the campaign against Compiègne.

But another conflict arose between the duke of Burgundy and the English. Jacqueline, countess of Hainaut, the divorced wife of the duke of Brabant and the heiress of Holland and Zeeland, had married the duke of Gloucester, who attempted to take forcible possession of his wife's territories. Philip, however, himself claimed Brabant as having been bequeathed to him by his cousin Philip, the late duke, with the result that the Burgundians repulsed the troops of the duke of Gloucester, and Jacqueline was forced to recognize the duke of Burgundy as her lieutenant and heir. Moreover, the duchess of Bedford had died in 1433. Charles VII., who in spite of the efforts of the cardinal of Ste-Croix and the conferences held by him at Auxerre and Semur had hitherto refused to return to France, finally decided to take part in the conferences which were opened at St Vaast d'Arras on the 6th of August 1435, and to which the whole of Christendom attached very high importance, all the princes of Europe and the pope and the council of Basel being represented. Philip consented to a reconciliation with the king of France, and agreed to recognize him as his legitimate sovereign on condition that he should not be required to pay him homage during his lifetime. Charles, on his part, solemnly craved pardon for the murder of John the Fearless through the mouth of the dean of the church in Paris, and handed over to the duke the counties of Mâcon, Auxerre, Bar-sur-Seine and Ponthieu, and the towns on and near the Somme (Roye, Montdidier, Péronne), reserving the option of redeeming the Somme towns for 400,000 gold crowns. Philip proved a faithful ally of the king, aiding him in re-entering Paris and preparing an expedition against Calais, which, however, failed through the ill-will of his Flemish subjects (1436). In 1440 he paid the ransom of Charles of Orleans (the son of his father's old enemy), who had heen a prisoner in England since the battle of Agincourt; received him with great honour at Gravelines; and married him to Mary of Cleves, upon whom he bestowed a handsome dowry. In 1442 Philip entered into a conspiracy to give the duke of Orleans a larger share in the affairs of the kingdom. To René of Anjou, the duke of Lorraine, he showed himself less generous, setting up another claimant to the duchy of Lorraine in the person of Anthony of Vaudemont, and taking René prisoner in 1431; it was not until 1436 that he consented definitively to release René on condition that he should abandon several strong places and pay an enormous ransom. In 1445, at the conferences of Châlons-sur-Marne, the duchess of Burgundy renounced these claims in her husband's name in order to assure the execution of the Treaty of Arras.

Philip was frequently disturbed by the insubordination of the Flemish communes. He had to quell seditions at Liége (1430), Ghent (1432) and Antwerp (1435). In 1438 he was driven with the duchess out of Bruges by the revolted citizens, a revolt which he repressed with great severity. In 1448 the citizens of Ghent rose in rebellion, but, disappointed of French support, they were defeated at Ruppelmonde and in 1453 were overwhelmed at the battle of Gavre, where they left 20,000 dead on the field. At a banquet shortly afterwards Philip vowed that he would lead a crusade against the Turks, who had seized Constantinople, and the knights of his court swore to follow his example.[1] The expedition, however, did not take place, and was but a pretext for levying subsidies and for knightly entertainments. In 1459 Philip sent an embassy under the duke of Cleves into Italy to take part in the conferences preparatory to a fresh expedition against the Turks, but this enterprise likewise fell to the ground. In 1456 the duke of Burgundy had given an asylum to the Dauphin Louis (afterwards Louis XI.), who had quarrelled with his father and had been forced to leave France. The "fox who would rob his host's hen-roost," as the old king called Louis, repaid his protector by attempting to sow discord in the ducal family of Burgundy, and then retired to the castle of Genappe in Brabant. At Charles VII.'s death, however, Philip was one of the first to recognize the new king, and accompanied him to Paris. During the journey Louis won over the seigneurs of Croy, the principal counsellors of the duke of Burgundy, and persuaded Philip to allow him to redeem the Somme towns for the sum stipulated in the Treaty of Arras. This proceeding infuriated Philip's son Charles, count of Charolais, who prevailed upon his father to break his pledge and declare war on the king of France. On the 12th of April 1465 Philip handed over to his son the entire administration of his

[1] This was the singular vow known as "the vow of the pheasant," from the fact that Philip placed his hand solemnly on a pheasant, which had been brought to him by his herald, and vowed that he would fight the Turks and challenge their sultan to single combat.

an extensive grant of lands. In 1196 he became duke of Swabia, on the death of his brother Conrad; and in May 1197 he married Irene, daughter of the eastern emperor, Isaac Angelus, and widow of Roger II., king of Sicily, a lady who is described by Walther von der Vogelweide as "the rose without a thorn, the dove without guile." Philip enjoyed his brother's confidence to a very great extent, and appears to have been designated as guardian of the young Frederick, afterwards the emperor Frederick II., in case of his father's early death. In 1197 he had set out to fetch Frederick from Sicily for his coronation when he heard of the emperor's death and returned at once to Germany. He appears to have desired to protect the interests of his nephew and to quell the disorder which arose on Henry's death, but events were too strong for him. The hostility to the kingship of a child was growing, and after Philip had been chosen as defender of the empire during Frederick's minority he consented to his own election. He was elected German king at Mühlhausen on the 8th of March 1198, and crowned at Mainz on the 8th of September following. Meanwhile a number of princes hostile to Philip, under the leadership of Adolph, archbishop of Cologne, had elected an anti-king in the person of Otto, second son of Henry the Lion, duke of Saxony. In the war that followed, Philip, who drew his principal support from south Germany, met with considerable success. In 1199 he received further accessions to his party and carried the war into his opponent's territory, although unable to obtain the support of Pope Innocent III., and only feebly assisted by his ally Philip Augustus, king of France. The following year was less favourable to his arms; and in March 1201 Innocent took the decisive step of placing Philip and his associates under the ban, and began to work energetically in favour of Otto. The two succeeding years were still more unfavourable to Philip. Otto, aided by Ottakar I., king of Bohemia, and Hermann I., landgrave of Thuringia, drove him from north Germany, thus compelling him to seek by abject concessions, but without success, reconciliation with Innocent. The submission to Philip of Hermann of Thuringia in 1204 marks the turning-point of his fortunes, and he was soon joined by Adolph of Cologne and Henry I., duke of Brabant. On the 6th of January 1205 he was crowned again with great ceremony by Adolph at Aix-la-Chapelle, though it was not till 1207 that his entry into Cologne practically brought the war to a close. A month or two later Philip was loosed from the papal ban, and in March 1208 it seems probable that a treaty was concluded by which a nephew of the pope was to marry one of Philip's daughters and to receive the disputed dukedom of Tuscany. Philip was preparing to crush the last flicker of the rebellion in Brunswick when he was murdered at Bamberg, on the 21st of June 1208, by Otto of Wittelsbach, count palatine in Bavaria, to whom he had refused the hand of one of his daughters. He left no sons, but four daughters; one of whom, Beatrix, afterwards married his rival, the emperor Otto IV. Philip was a brave and handsome man, and contemporary writers, among whom was Walther von der Vogelweide, praise his mildness and generosity.

PHILIP I., the Handsome (1478–1506), king of Spain, son of the emperor Maximilian I., and husband of Joanna the Mad, daughter of Ferdinand and Isabella, was the founder of the Habsburg dynasty in Spain, and was born at Bruges on the 22nd of July 1478. In 1482 he succeeded to the Burgundian possessions of his mother Mary, daughter of Charles the Bold, under the guardianship of his father. In 1496 he married Joanna. The marriage was one of a set of family alliances with Austria and Portugal designed to strengthen Spain against France. The death of John, the only son of Ferdinand and Isabella, opened the succession to the Spanish Crown to Joanna. In 1502 she and her husband received the homage of the cortes of Castile and of Aragon as heirs. Philip returned to Flanders before the close of the year. His life with Joanna was rendered extremely unhappy by his infidelity and by her jealousy, which, working on a neurotic temperament, precipitated her insanity. The princess gave way to paroxysms of rage, in which she was guilty of acts of atrocious violence. Before her mother's death, in 1504, she was unquestionably quite insane, and husband and wife lived apart. When Isabella died, Ferdinand endeavoured to lay hands on the regency of Castile, but the nobles, who disliked and feared him, forced him to withdraw. Philip was summoned to Spain, where he was recognized as king. He landed, with his wife, at Corunna on the 28th of April 1506, accompanied by a body of German mercenaries. Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

Charles V. at the hands of Maurice in 1552; and after the conclusion of the Peace of Passau in this year he returned to Hesse. Although less active than formerly, the landgrave did not cease to intrigue on behalf of the Protestants while continuing the work of reforming and organizing the Church in Hesse. In 1562 he aided the Huguenots with troops, and he was frequently in communication with the insurgents in the Netherlands; but his efforts to form a union of the Protestants were fruitless. Philip, who is sometimes called the *Magnanimous*, died at Casse on the 31st of March 1567. By Christina he had four sons and five daughters, and according to his directions the landgraviate was partitioned at his death between his sons. He had also by Margaret von der Saal seven sons, who were called counts of Dietz, and one daughter.

PHILIP, JOHN (1775–1851), British missionary in South Africa, was born on the 14th of April 1775, at Kirkcaldy, Fife, the son of a schoolmaster in that town. After having been apprenticed to a linendraper, and for three years a clerk in a Dundee business house, he entered the Hoxton (Congregational) Theological College, and in 1804 was appointed to a Congregational chapel in Aberdeen. In 1818 he joined the Rev. John Campbell in his second journey to South Africa to inspect the stations of the London Missionary Society, and reported that the conduct of the Cape Colonists towards the natives was deserving of strong reprobation. In 1822 the London Missionary Society appointed him superintendent of their South African stations. He made his headquarters at Cape Town, where he also established and undertook the pastorate of the Union Chapel. His indignation was aroused by the barbarities inflicted upon the Hottentots and Kaffirs (by a minority of the colonists), and he set himself to remedy their grievances; but his zeal was greater than his knowledge. He misjudged the character both of the colonists and of the natives, his cardinal mistake being in regarding the African as little removed from the European in intellect and capacity. It was the period of the agitation for the abolition of slavery in England, where Philip's charges against the colonists and the colonial government found powerful support. His influence was seen in the ordinance of 1828 granting all free coloured persons at the Cape every right to which any other British subjects were entitled. During 1826–1828 he was in England, and in the last-named year he published *Researches in South Africa*, containing his views on the native question. His recommendations were adopted by the House of Commons, but his unpopularity in South Africa was great, and in 1830 he was convicted of libelling a Cape official. The British government, however, caused the Cape government to conform to the views of Philip, who for over twenty years exercised a powerful, and in many respects unfavourable, influence over the destinies of the country. One of Philip's ideals was the curbing of colonial "aggression" by the creation of a belt of native states around Cape Colony. In Sir Benjamin D'Urban Philip found a governor anxious to promote the interests of the natives. When however at the close of the Kaffir War of 1834–35 D'Urban annexed the country up to the Kei River, Philip's hostility was aroused. He came to England in 1836, in company with a Kaffir convert and a Hottentot convert, and aroused public opinion against the Cape government. His views triumphed, D'Urban was dismissed, and Philip returned to the Cape as unofficial adviser to the government on all matters affecting the natives. For a time his plan of buffer states was carried out, but in 1846 another Kaffir rising convinced him of the futility of his schemes. The Kaffir chief who had accompanied him to England joined the enemy; and many of his converts showed that his efforts on their behalf had effected no change in their character. This was a blow from which he did not recover. The annexation of the Orange River Sovereignty in 1848 followed, finally destroying his hope of maintaining independent native states. In 1849 he severed his connexion with politics and retired to the mission station at Hankey, Cape Colony, where he died on the 27th of August 1851.

PHILIP, KING (*c.* 1639–1676), chief sachem of the Wampanoag Indians in America, and the son of Massasoit (d. 1662)—as the English, mistaking this title (great chief) for a proper name, called Woosamequin (Yellow Feather)—who for forty years was the friend and ally of the English colonists at Plymouth. To Massasoit's two sons, Wamsutta and Metacomet, the English gave the names respectively of Alexander and Philip. Alexander succeeded his father as sachem, and in the same year, while in Marshfield, whither he had gone to explain certain alleged unfriendly acts toward the English, was taken ill; he died on his way home. Philip, who succeeded Alexander, suspected the English of poisoning his brother. The English had grown stronger and more numerous, and had begun to meddle in the internal affairs of the Indians. In 1667 one of Philip's Indians accused him to the English of attempting to betray them to the French or Dutch, but this charge was not proved. In 1671 the Plymouth authorities demanded that the Wampanoags should surrender their arms; Philip consented, but his followers failed to comply, and measures were taken to enforce the promise. Philip thereupon went before the general court, agreed to pay an annual tribute, and not to sell lands or engage in war with other Indians without the consent of the Plymouth government. In 1674, when three Wampanoags were executed at Plymouth for the alleged murder of Sassamon, an Indian convert who had played the part of informer to the English, Philip could no longer hold his followers in check. There were outbreaks in the middle of June 1675, and on the 24th of June the massacre of whites began. There was no concerted movement of the various tribes and the war had not been previously planned. The Nipmuck Indians rose in July; the tribes along the Connecticut river in August; those in the present states of Maine and New Hampshire in September and October, and the Narragansets in December, when (on the 19th) they were attacked and seriously crippled, in what is now the township of South Kingstown, Rhode Island, by the English (under Governor Josiah Winslow of Plymouth), who suspected their loyalty.

The colony of Connecticut took quick measures of defence, guarded its frontier, maintained its alliance with the Mohegans, and suffered little injury. Massachusetts and Plymouth were slower in acting and suffered great loss. Rhode Island raised no troops, and suffered severely. Early in the autumn Philip went nearly as far west as Albany in an unsuccessful attempt to get aid from the French and the Mohawks and supplies from the Dutch traders. At Deerfield on the 18th of September about 60 English were killed and the settlement was abandoned. In the spring of 1676 it became evident that the Indian power was waning. The warriors had been unable to plant their crops; they were weaker numerically and more poorly armed than the English, and the latter had also made an alliance with the friendly Naticks and the Niantics. On the 1st of August 1676 Philip's wife and nine-year old son were captured, and on the 11th of August an Indian traitor guided the English to the sachem's hiding-place in a swamp at the foot of Mount Hope (in what is now the township of Bristol, Rhode Island), where early the next morning he was surprised, and while trying to escape was killed by an Indian. The head of Philip was sent to Plymouth and set

an extensive grant of lands. In 1196 he became duke of Swabia, on the death of his brother Conrad; and in May 1197 he married Irene, daughter of the eastern emperor, Isaac Angelus, and widow of Roger II., king of Sicily, a lady who is described by Walther von der Vogelweide as "the rose without a thorn, the dove without guile." Philip enjoyed his brother's confidence to a very great extent, and appears to have been designated as guardian of the young Frederick, afterwards the emperor Frederick II., in case of his father's early death. In 1197 he had set out to fetch Frederick from Sicily for his coronation when he heard of the emperor's death and returned at once to Germany. He appears to have desired to protect the interests of his nephew and to quell the disorder which arose on Henry's death, but events were too strong for him. PHILIP I., the Handsome (1478–1506), king of Spain, son of the emperor Maximilian I., and husband of Joanna the Mad, daughter of Ferdinand and Isabella, was the founder of the Habsburg dynasty in Spain, and was born at Bruges on the 22nd of July 1478. In 1482 he succeeded to the Burgundian possessions of his mother Mary, daughter of Charles the Bold, under the guardianship of his father. In 1496 he married Joanna. The marriage was one of a set of family alliances with Austria and Portugal designed to strengthen Spain against France. The death of John, the only son of Ferdinand and Isabella, opened the succession to the Spanish Crown to Joanna. In 1502 she and her husband received the homage of the cortes of Castile and of Aragon as heirs. Philip returned to Flanders before the close of the year. His life with Joanna was rendered extremely unhappy by his infidelity and by her jealousy, which, working on a neurotic temperament, precipitated her insanity. The princess gave way to paroxysms of rage, in which she was guilty of acts of atrocious violence. Before her mother's death, in 1504, she was unquestionably quite insane, and husband and wife lived apart. When Isabella died, Ferdinand endeavoured to lay hands on the regency of Castile, but the nobles, who disliked and feared him, forced him to withdraw. Philip was summoned to Spain, where he was recognized as king. He landed, with his wife, at Corunna on the 28th of April 1506, accompanied by a body of German mercenaries. Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

the apostle's health and prospects (i. 12), assured him of their prayers (i. 19), and wondered whether he, their pride and glory (καύχημα), would return to them (i. 25 seq.).

After a brief greeting (i. 1, 2), Paul assures them of his loving interest in their present attainments and future progress in the faith of the gospel (i. 3–11); then, relieving their anxiety about his own prospects, he expresses the confident hope that he will be released and thus be able to return to them (i. 12–26). Meantime they were to avoid any pride or factiousness which might break their unity [1] as a church (i. 27–ii. 18), and they are promised a visit from two of Paul's coadjutors,[2] who are well known to them (ii.19–30). At this point the letter suddenly swerves [3] into a passionate warning against some errorists of Judaism (iii. 1–iv. 1), after which the appeal for unity at Philippi is reiterated (iv. 2–9),[4] and the epistle closes with some personal details (iv. 10–23).

Paul is a prisoner when he writes, and the place of composition may therefore be Caesarea or Rome (Acts xxviii. 16, 30–31). The evidence upon the whole seems to point to the latter. The phrase οἰκία Καίσαρος (iv. 22) suits Rome better than Caesarea, and, while πραιτώριον (i. 13) does not necessarily imply the capital, it is most naturally understood of Rome.[5] But the whole tone of the epistle suggests that Paul expected a speedy end to his case. Now at Caesarea this was out of the question. His appeal to Caesar involved a protracted process, and it is very difficult to put expressions like those *e.g.* of ii. 23 into such a situation. The critical outlook of Philippians does not correspond with the position of the apostle at Caesarea, nor can the latter town be said to have been a centre of vigorous Christian propaganda (i. 17). Finally, the contention that no visit of Timothy to Rome is known is an argument from silence which is of little more weight than the plea of Spitta that the cupidity of Felix (Acts xxiv. 26) was excited by the arrival of the money from Philippi (Phil. iv. 16).

A further examination of the epistle shows that it must have been written towards the close of the διετία ὅλη of Acts xxviii. 30, not in the earlier part of the Roman captivity. Paul is on the edge and eve of the great decision. Behind him (i. 12–13) lies a period during which considerable progress has been made in the local preaching and extension of the gospel, nor does the language of the apostle suggest that this fresh departure in the propaganda was stimulated by the mere novelty of his arrival. Furthermore, the relations between the Philippians and himself presuppose, on any fair estimate, an interval of time which cannot be crushed into a few months. News of his arrival must have reached them; money was collected (ii. 25, iv. 18) and then forwarded by Epaphroditus, who fell sick after he reached the capital; news of this again floated back to Philippi, and subsequently Paul heard of the Philippians' concern (ii. 26). Not till then did he compose this letter.

Philippians is thus the last extant letter we possess from Paul, unless some of the notes embedded in the pastoral epistles are to be dated subsequent to its composition. It unites the close of his career in Rome with the beginning of his mission work in Europe (iv. 15; cf. Acts xvi. 12), and illustrates not merely the situation of the apostle at Rome, but the terms of exceptional affection which existed from first to last between him and the Macedonian churches. The main argument for putting it earlier is derived from the admitted affinities between it and Romans, the Colossian and Ephesian epistles containing, it is held, a more advanced christology (so Lightfoot especially, and Hort, *Judaistic Christianity*, pp. 115–129). But such considerations are not decisive. Paul wrote from time to time, not in the execution of a literary plan, but as different objects or interests called out his powers. The Philippians did not require, and therefore did not receive, the same elaborate warnings as the Asiatic churches. Hence on the one hand it is unreal to lay stress on coincidences with Romans, as if these necessarily implied that both epistles must have been composed shortly after one another, while again the further stage of thought on Christ and the Church, which is evident in Colossians, does not prove that the latter must have followed the former. Upon the whole, the internal evidence of the epistle strongly favours its position as the last of the captivity epistles.

The attempts made during the 19th century to disprove the Pauline authorship now possess merely an historic interest, nor have the various hypotheses of more or less extensive interpolation won any serious support.[6] More significance attaches to the view that the epistle is made up of two separate notes, written to Philippi at different times. The fusion of the two is found in the abrupt hiatus of iii. 1, and evidence is led from supposed inconsistencies between the earlier and the latter parts of the epistle. But the flexibility of a letter-writer, under different moods of feeling, which would naturally lead to rapid transitions, may be adduced as some explanation of the latter phenomena. The exegesis does not absolutely necessitate a partition of the epistle, which (so Heinrichs and Paulus) would make iii. 1–iv. 20 a special letter addressed to some inner circle of the apostle's friends (in spite of iv. 10 seq.), or take iii.–iv. (Hausrath, *History of N. T. Times*, iv. 162 seq. and Bacon, *Story of St Paul*, pp. 367 seq.) as earlier than i.–ii. Besides, as Pfleiderer points out, the hypothesis is shipwrecked on the difficulty of imagining that "each of the epistles had but one essential part: the first, in particular, lacking an expression of thanks for the gift from the Philippians, which must nevertheless, according to ii. 25, have already taken place." In his letter to the Philippians (iii. 2) Polycarp indeed observes that Paul wrote ἐπιστολάς to them; but, even if the plural could not be taken as equivalent to a single despatch, it would not necessarily support the partition theory of the canonical Philippians. Polycarp may have known of more than one Pauline note to Philippi, no longer extant, or he may be referring loosely to 2 Thessalonians, which was addressed to a neighbouring Macedonian church. The exegetical arguments are, in short, the final court of appeal, and their verdict tells rather in favour of the epistle's integrity. The simplest account of iii. 1 is to suppose that Paul started afresh to complete or supplement what he had already written, possibly because some fresh tidings from Philippi had reached him in the interval. Psychologically the change from ii. 19 seq., with its note of farewell, to the impassioned outburst of iii. 2 seq., is not incredible in an informal letter from a man like Paul. The hiatus is striking, but it cannot be held to necessitate an editorial dovetailing of two separate epistles. It is doubtful, therefore, if the ingenious attempts to analyse Philippians have proved much more convincing than the similar movement of literary criticism upon the first Philippic of Demosthenes, where research has swung back in the main to a conservative position (cf. A. Baron in *Wiener Studien*, 1884, 173–205).

The first clear echoes of the epistle are heard in Polycarp, though it was probably known to Clement of Rome and Ignatius (cf. the evidence tabulated in *The New Testament in the Apostolic*

[1] For the strong Christian consciousness of solidarity, presupposed in the Philippians, see Von Dobschutz's *Christian Life in the Primitive Church* (1904), pp. 93 seq.

[2] The touch of acerbity in ii. 21 (after i. 14) is probably to be explained by the fact that "Paul had found some of the brethren reluctant to undertake a journey to Macedonia, or to perform some other service which he desired, and the words only express the momentary disappointment of a man who was imprisoned and ready to die for the gospel" (Drummond). Cf. Renan's *Antichrist* (Eng. trans. p. 48).

[3] The so-called logion in (Justin's ?) *De resurrect.* 9: εἴρηκεν ἐν οὐρανῷ τὴν κατοίκησιν ὑπάρχειν, seems a mere echo of iii. 20.

[4] On iv. 8 Von Soden notes (*History of Early Christian Literature*, p. 114) that "it is as if we heard the ripple of the waves at the meeting of the two streams which have their source in Zion and the Parthenon."

[5] If the expression meant (*a*) the *praefecti praetorio* or officials charged with the care of prisoners under trial, *i.e.* the supreme imperial court, or (*b*) the praetorian guard, or (*c*) their barracks, this would almost follow. But conceivably it might mean the palace, *i.e.* of Herod (Acts xxiii. 35). The balance of probabilities falls, however, in favour of the court hypothesis.

[6] To the details furnished in the present writer's *Historical New Testament* (2nd ed., 1901, pp. 634–635) may be added references to Völter's *Paulus u. seine Briefe* (1905), pp. 286–323, Belser's *Einleitung in der N. T.* (2nd ed., 1905), pp. 555 seq., and Schmiedel's paragraphs in *Ency. Bib.* (3147–3148). Pfleiderer (*Primitive Christianity*, i. 254 seq.) now hesitates on ii. 6 seq. alone like Brückner and Schmiedel. The objections to Paul's authorship on the score of style and grammar are finally set aside by the philologist Nägeli in *Der Wortschatz des Apostels Paulus* (1905), pp. 80–82.

an extensive grant of lands. In 1196 he became duke of Swabia, on the death of his brother Conrad; and in May 1197 he married Irene, daughter of the eastern emperor, Isaac Angelus, and widow of Roger II., king of Sicily, a lady who is described by Walther von der Vogelweide as "the rose without a thorn, the dove without guile." Philip enjoyed his brother's confidence to a very great extent, and appears to have been designated as guardian of the young Frederick, afterwards the emperor Frederick II., in case of his father's early death. In 1197 he had set out to fetch Frederick from Sicily for his coronation when he heard of the emperor's death and returned at once to Germany. He appears to have desired to protect the interests of his nephew and to quell the disorder which arose on Henry's death, but events were too strong for him. The hostility to the kingship of a child was growing, and after Philip had been chosen as defender of the empire during Frederick's minority he consented to his own election. He was elected German king at Mühlhausen on the 8th of March 1198, and crowned at Mainz on the 8th of September following. Meanwhile a number of princes hostile to Philip, under the leadership of Adolph, archbishop of Cologne, had elected an anti-king in the person of Otto, second son of Henry the Lion, duke of Saxony. In the war that followed, Philip, who drew his principal support from south Germany, met with considerable success. In 1199 he received further accessions to his party and carried the war into his opponent's territory, although unable to obtain the support of Pope Innocent III., and only feebly assisted by his ally Philip Augustus, king of France. The following year was less favourable to his arms; and in March 1201 Innocent took the decisive step of placing Philip and his associates under the ban, and began to work energetically in favour of Otto. The two succeeding years were still more unfavourable to Philip. Otto, aided by Ottakar I., king of Bohemia, and Hermann I., landgrave of Thuringia, drove him from north Germany, thus compelling him to seek by abject concessions, but without success, reconciliation with Innocent. The submission to Philip of Hermann of Thuringia in 1204 marks the turning-point of his fortunes, and he was soon joined by Adolph of Cologne and Henry I., duke of Brabant. On the 6th of January 1205 he was crowned again with great ceremony by Adolph at Aix-la-Chapelle, though it was not till 1207 that his entry into Cologne practically brought the war to a close. A month or two later Philip was loosed from the papal ban, and in March 1208 it seems probable that a treaty was concluded by which a nephew of the pope was to marry one of Philip's daughters and to receive the disputed dukedom of Tuscany. Philip was preparing to crush the last flicker of the rebellion in Brunswick when he was murdered at Bamberg, on the 21st of June 1208, by Otto of Wittelsbach, count palatine in Bavaria, to whom he had refused the hand of one of his daughters. He left no sons, but four daughters; one of whom, Beatrix, afterwards married his rival, the emperor Otto IV. Philip was a brave and handsome man, and contemporary writers, among whom was Walther von der Vogelweide, praise his mildness and generosity.

See W. von Giesebrecht, *Geschichte der deutschen Kaiserzeit*, Bd. V. (Leipzig, 1888); E. Winkelmann, *Philipp von Schwaben und Otto IV. von Braunschweig* (Leipzig, 1873–1878); O. Abel, *König Philipp der Hohenstaufen* (Berlin, 1852); *Regesta imperii. V.*, edited by J. Ficker (Innsbruck, 1881); R. Schwemer, *Innocenz III. und die deutsche Kirche während des Thronstreites von 1198–1208* (Strassburg, 1882); and R. Riant, *Innocent III., Philippe de Souabe, et Boniface de Montferrat* (Paris, 1875).

PHILIP I., the Handsome (1478–1506), king of Spain, son of the emperor Maximilian I., and husband of Joanna the Mad, daughter of Ferdinand and Isabella, was the founder of the Habsburg dynasty in Spain, and was born at Bruges on the 22nd of July 1478. In 1482 he succeeded to the Burgundian possessions of his mother Mary, daughter of Charles the Bold, under the guardianship of his father. In 1496 he married Joanna. The marriage was one of a set of family alliances with Austria and Portugal designed to strengthen Spain against France. The death of John, the only son of Ferdinand and Isabella, opened the succession to the Spanish Crown to Joanna. In 1502 she and her husband received the homage of the cortes of Castile and of Aragon as heirs. Philip returned to Flanders before the close of the year. His life with Joanna was rendered extremely unhappy by his infidelity and by her jealousy, which, working on a neurotic temperament, precipitated her insanity. The princess gave way to paroxysms of rage, in which she was guilty of acts of atrocious violence. Before her mother's death, in 1504, she was unquestionably quite insane, and husband and wife lived apart. When Isabella died, Ferdinand endeavoured to lay hands on the regency of Castile, but the nobles, who disliked and feared him, forced him to withdraw. Philip was summoned to Spain, where he was recognized as king. He landed, with his wife, at Corunna on the 28th of April 1506, accompanied by a body of German mercenaries. Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

PHILIP I., the Handsome (1478–1506), king of Spain, son of the emperor Maximilian I., and husband of Joanna the Mad, daughter of Ferdinand and Isabella, was the founder of the Habsburg dynasty in Spain, and was born at Bruges on the 22nd of July 1478. In 1482 he succeeded to the Burgundian possessions of his mother Mary, daughter of Charles the Bold, under the guardianship of his father. In 1496 he married Joanna. The marriage was one of a set of family alliances with Austria and Portugal designed to strengthen Spain against France. The death of John, the only son of Ferdinand and Isabella, opened the succession to the Spanish Crown to Joanna. In 1502 she and her husband received the homage of the cortes of Castile and of Aragon as heirs. Philip returned to Flanders before the close of the year. His life with Joanna was rendered extremely unhappy by his infidelity and by her jealousy, which, working on a neurotic temperament, precipitated her insanity. The princess gave way to paroxysms of rage, in which she was guilty of acts of atrocious violence. Before her mother's death, in 1504, she was unquestionably quite insane, and husband and wife lived apart. When Isabella died, Ferdinand endeavoured to lay hands on the regency of Castile, but the nobles, who disliked and feared him, forced him to withdraw. Philip was summoned to Spain, where he was recognized as king. He landed, with his wife, at Corunna on the 28th of April 1506, accompanied by a body of German mercenaries. Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

Agno rises in the mountains on the north border, flows south, south-west and north-west, and discharges through several channels into the Gulf of Lingayén. Each of these has a great number of small tributaries, and along the coast of this lowland basin are many small tide-water streams. The Pasig is a short but commercially important stream connecting Laguna de Bay with Manila Bay. The Rio Bicol, which rises in Lake Bato and flows N.N.W. into San Miguel Bay, is the principal river of south Luzon. Samar, Panay, Negros, Leyte, Bohol and Cebú are drained by many streams, and a few of those in Samar, Panay and Negros are of considerable size.

In the lowland basin of central Luzon, 6 m. inland from Manila Bay, is Laguna de Bay, the largest body of fresh water in the Philippines. It is 32 m. long from north-west to south-east and its coast-line, broken on the north by two hilly peninsulas, is 108 m. long. Lake Taal, a few miles south-west of Laguna de Bay, occupies the crater of a great volcano. It is 17½ m. long and 12 m. wide. The country rises gently to it on all sides, and on an island near its centre is the active volcano of Taal, 1050 ft. high. In north Luzon is Lake Cagayán. In Mindanao there are lakes Lanao, Liguasan and Buluan in the west-central portion and lakes Mainit, Pinaya, Dagun, Sadocum and Linao in the valley of the Agusan. There are small lakes in some of the other islands.

Geology.—The Philippines appear to be the remnants of a somewhat complex system of mountain arcs, which from their similarity of form and direction seem to be in some way connected with the mountain ranges of Annam. The oldest rocks exposed are gneiss, talc-schist and serpentine, with intrusive masses of gabbro and diabase. These are overlaid by a limestone, upon which rests conformably a series of sandstones with coal seams. The age of these beds is unknown. In some of the islands nummulitic limestone (Eocene) occurs. Coral limestones, probably of Middle Tertiary age, are also found, sometimes 4000 ft. above the sea, and marine deposits of a very late geological period occur near the coast and in the low-lying depressions. Volcanic rocks of modern date cover extensive areas, especially in the southern part of Luzon and in Mindanao. In Luzon trachytic tuffs are sometimes interstratified with nummulitic limestone, thus showing that the eruptions had already begun in the Eocene period.

Volcanoes and Earthquakes.—There are twelve active volcanoes in the archipelago. They are Babuyán Claro, Camiguín de Babuyanes and Didicas in the Babuyanes Islands off the north coast of Luzon; Cagua or Caua in north Luzon; Taal, Mayón and Bulusan in south Luzon; Canlaon and Magasó in Negros; Camiguín de Mindanao in the island of Camiguín, off the north coast of Mindanao; and Apo and Calayo in Mindanao. Only a few eruptions have been recorded of any of these, however, except Taal and Mayón, and there has been no great eruption of Taal since 1754. But there were 26 eruptions of Mayón in the 19th century, and those of 1814 and 1897 were of great violence. That of 1897 began practically without warning on the 23rd of June, became alarming on the 24th and destructive on the 25th, and ceased on the 30th. Streams of lava completely destroyed several villages and injured others, as well as the town of San Fernando. The lava flow extended more than 7 m. eastward, and a rain of ashes extended 100 m. to the east and 75 m. to the west. There are eight other volcanoes, which although extinct or dormant have well-preserved cones. They are Aráyat, Banájao, San Cristóbal, Isarog and Malinao in south Luzon, and Macaturin and Matutum in Mindanao.

Earthquakes are frequent and occasionally violent. In the seven years 1902–1908 the microseismograph at Manila recorded 796 local earthquakes. In the 47 years ending March 1909 the various regions of the archipelago were visited by about 60 strong earthquakes; 16 of these, in ten different regions, occurred in the decade from 1890 to 1900. There were 8 in the year 1897 alone, and one of these ruined the town of Zamboanga in west Mindanao and caused considerable loss of life by falling buildings and immense sea waves. A new island appeared at this time off the coast of Borneo, near Labuan. The principal centres of disturbance are in the valley of the Agusan, in the region of Mayón volcano, in the region of Taal volcano, on Masbate Island, and along the north shore of Luzon. The islands of Cebú, Bohol, Negros and Palawan are rarely shaken.

Fauna.—The Philippines, politically speaking, and the Philippines, zoologically speaking, are not identical areas; Balabac, Palawan and the Calamianes being characterized by the occurrence of numerous Bornean forms which are conspicuously absent from the remaining islands. Although the Philippines are commonly held to form an eastern extension of the Indo-Malayan sub-region, there is a large amount of specialization in the fauna of the islands eastward of the Palawan group. Mammals are scarce. No marsupials occur. The edentates are represented by the pangolin (*Manis* sp. ?) of the Palawan group. In the seas are found the dolphin, cachalot and dugong. Wild hogs of at least two species occur. The beautiful axis deer of Sulu has apparently been brought there by man. Red or brown deer occur in Basilan, Mindanao, Leyte, Samar and the Calamianes Islands. The number of species and their respective ranges have not been satisfactorily determined. In Masbate, Panay, Guimaras and Negros there is a dark-coloured species marked with buff spots. Deer are absent in Palawan, Tawi Tawi, Tablas, Romblon, Sibuyan and Siquijor. Humped cattle are raised on most of the islands. They are killed for their flesh, hides and horns, and little attention is paid to their milk-giving properties. The water-buffalo, or caraboa, occurs in a wild state in Luzon, Mindoro, the Calamianes group, Masbate, Negros and Mindanao, but the wild herds are believed to have originated from domesticated animals. The domesticated water-buffalo is sluggish in its movements, and will not work through the heat of the day; but it is a wonderful swimmer, and makes its way through the worst quagmire with ease. It is universally used as a draught animal and beast of burden. The most interesting of the ruminants is the timarau (*Bubalus mindorensis*, Heude), peculiar to Mindoro. Unlike the water-buffalo, it does not bathe in water or wallow in mud. It is extremely wild, feeding by night and sleeping by day in the densest jungle. It sometimes charges the hunter without provocation, and is very dangerous when wounded. It attacks and kills the much larger wild buffalo. All attempts to domesticate it have failed. A chevrotain is found in Balabac. The house rat, introduced by man, is a common nuisance, and mice occasionally seriously damage sugar-cane and rice. Squirrels are confined to the eastern chain of islands from Basilan to Samar and to the Palawan-Calamianes group. In the southern islands there is a tiny species, the size of a mouse. Very large flying-squirrels are found in Palawan and Mindanao. Squirrel-shrews occur in the Palawan-Calamianes group, and true shrews at various points in the archipelago. Among the Carnivores are the binturong and an otter, both found in the Palawan-Calamianes group; two civet cats, which range throughout the archipelago, and a wild cat of small size, which has been found in Palawan, Panay, Negros and Luzon. Bats are very numerous, and a number of the species are peculiar to the Philippines. *Galeopithecus* and *Tarsius* range from Basilan to Samar; the former occurs also in Bohol. In spite of all that has been said to the contrary, but one species of monkey (*Macacus philippinensis*, Geoff.) has been discovered in the Philippines. It occurs on every island of any importance. Its flesh is occasionally eaten by the natives. Albino specimens of this monkey are not uncommon, but the pure white monkeys, not albinos, said to inhabit Mindanao, are mythical. The large fruit bats (*Pteropus*) occur in immense colonies, and are sometimes eaten by the natives.

Especial importance attaches to the unexpected discovery by Whitehead of a new and peculiar mammalian fauna, inhabiting a small plateau on the top of Mt Data, in north Luzon, at an altitude of more than 7000 ft. Specimens of 15 species were obtained, embracing 5 new genera (*Calaemomys*, *Chrotomys*, *Rhynchomys*, *Batomys* and *Carpomys*). Eight of the species were new and strikingly peculiar. Their zoological relationships are probably with Celebes and with Australia. Other discoveries include a few new squirrels and bats, and the occurrence of a lemur (*Nycticebus tardigradus*) in Tawi Tawi.

The islands are as rich in birds as they are poor in mammals, the total number of species recorded up to 1906 being 693, of which about one-half are peculiar to the Philippines. A study of their geographical distribution has demonstrated that the islands may be divided into fairly well-marked groups, in each of which the birds show a degree of specialization closely correlated with diversity of environment and completeness and probable duration of separation from adjacent groups. Balabac, Palawan and the Calamianes show a very strong Bornean element. Mindoro stands by itself. Luzon and the small neighbouring islands have 51 peculiar forms. A close relationship exists between the birds of the entire eastern chain of islands. Numerous genera and some families which are absent from the central islands range from Luzon to Basilan. These genera usually have distinct representative species in Luzon, Samar and Leyte, Mindanao, and in some cases in Basilan also. The greatest differences occur between Luzon and Samar and Leyte. The latter islands have 22 peculiar species.

Sulu and Tawi Tawi belong zoologically to the Philippines, but have 12 well-marked peculiar species, and many of the characteristic Mindanao-Basilan forms are lacking. Panay, Guimaras, Negros and Masbate constitute a sharply defined area, characterized not only by the occurrence of 30 peculiar species, but by the absence of important genera, and even whole families represented in the eastern islands. Most of the mammals characteristic of the latter region are lacking. It is a curious fact that Cebú stands quite by itself, although the deep channel separating it from Negros narrows at one point to about 4 m. Cebú possesses 9 striking species of birds not known to exist elsewhere, and lacks many of the characteristic forms of the central and eastern islands. The zoological position of Bohol has not been satisfactorily determined, but all existing evidence indicates that it must be grouped with Samar and Leyte.

Among the more interesting birds may be mentioned the "mound builder" (*Megapodius cumingi*, Dillwyn), which buries its large eggs in the soft sand along the sea beach, or under great mounds of earth and dead leaves, often at a depth of three or more feet below the surface. The young are forced to dig their way out and shift for themselves. The eggs are highly prized by the natives. The jungle fowl abounds. There are 35 species of pigeons and doves, many of them most beautifully coloured and all edible. Snipe, plover, turnstones and other shore birds are abundant during

an extensive grant of lands. In 1196 he became duke of Swabia, on the death of his brother Conrad; and in May 1197 he married Irene, daughter of the eastern emperor, Isaac Angelus, and widow of Roger II., king of Sicily, a lady who is described by Walther von der Vogelweide as "the rose without a thorn, the dove without guile." Philip enjoyed his brother's confidence to a very great extent, and appears to have been designated as guardian of the young Frederick, afterwards the emperor Frederick II., in case of his father's early death. In 1197 he had set out to fetch Frederick from Sicily for his coronation when he heard of the emperor's death and returned at once to Germany. He appears to have desired to protect the interests of his nephew and to quell the disorder which arose on Henry's death, but events were too strong for him. The hostility to the kingship of a child was growing, and after Philip had been chosen as defender of the empire during Frederick's minority he consented to his own election. He was elected German king at Mühlhausen on the 8th of March 1198, and crowned at Mainz on the 8th of September following. Meanwhile a number of princes hostile to Philip, under the leadership of Adolph, archbishop of Cologne, had elected an anti-king in the person of Otto, second son of Henry the Lion, duke of Saxony. In the war that followed, Philip, who drew his principal support from south Germany, met with considerable success. In 1199 he received further accessions to his party and carried the war into his opponent's territory, although unable to obtain the support of Pope Innocent III., and only feebly assisted by his ally Philip Augustus, king of France. The following year was less favourable to his arms; and in March 1201 Innocent took the decisive step of placing Philip and his associates under the ban, and began to work energetically in favour of Otto. The two succeeding years were still more unfavourable to Philip. Otto, aided by Ottakar I., king of Bohemia, and Hermann I., landgrave of Thuringia, drove him from north Germany, thus compelling him to seek by abject concessions, but without success, reconciliation with Innocent. The submission to Philip of Hermann of Thuringia in 1204 marks the turning-point of his fortunes, and he was soon joined by Adolph of Cologne and Henry I., duke of Brabant. On the 6th of January 1205 he was crowned again with great ceremony by Adolph at Aix-la-Chapelle, though it was not till 1207 that his entry into Cologne practically brought the war to a close. A month or two later Philip was loosed from the papal ban, and in March 1208 it seems probable that a treaty was concluded by which a nephew of the pope was to marry one of Philip's daughters and to receive the disputed dukedom of Tuscany. Philip was preparing to crush the last flicker of the rebellion in Brunswick when he was murdered at Bamberg, on the 21st of June 1208, by Otto of Wittelsbach, count palatine in Bavaria, to whom he had refused the hand of one of his daughters. He left no sons, but four daughters; one of whom, Beatrix, afterwards married his rival, the emperor Otto IV. Philip was a brave and handsome man, and contemporary writers, among whom was Walther von der Vogelweide, praise his mildness and generosity.

Riant, *Innocent III., Philippe de Souabe, et Boniface de Montferrat* (Paris, 1875).

PHILIP I., the Handsome (1478–1506), king of Spain, son of the emperor Maximilian I., and husband of Joanna the Mad, daughter of Ferdinand and Isabella, was the founder of the Habsburg dynasty in Spain, and was born at Bruges on the 22nd of July 1478. In 1482 he succeeded to the Burgundian possessions of his mother Mary, daughter of Charles the Bold, under the guardianship of his father. In 1496 he married Joanna. The marriage was one of a set of family alliances with Austria and Portugal designed to strengthen Spain against France. The death of John, the only son of Ferdinand and Isabella, opened the succession to the Spanish Crown to Joanna. In 1502 she and her husband received the homage of the cortes of Castile and of Aragon as heirs. Philip returned to Flanders before the close of the year. His life with Joanna was rendered extremely unhappy by his infidelity and by her jealousy, which, working on a neurotic temperament, precipitated her insanity. The princess gave way to paroxysms of rage, in which she was guilty of acts of atrocious violence. Before her mother's death, in 1504, she was unquestionably quite insane, and husband and wife lived apart. When Isabella died, Ferdinand endeavoured to lay hands on the regency of Castile, but the nobles, who disliked and feared him, forced him to withdraw. Philip was summoned to Spain, where he was recognized as king. He landed, with his wife, at Corunna on the 28th of April 1506, accompanied by a body of German mercenaries. Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

has been planted with these trees. They thrive well also in most low districts along the coasts; in 1902 about 375,000 acres were devoted to the culture of them.

Rice is the staple food of the natives. When the Philippines were discovered by the Spaniards it was the only cultivated crop of importance, and until the 19th century it was the chief article of export, but as the culture of the more profitable crops of hemp, sugar and coco-nuts was extended it became an article of import. As late as 1902, however, about one-half of the land under cultivation was sown to rice. It is grown most extensively in the lowlands of the south half of Luzon, in north Panay and in Negros, but the culture of either the lowland or the upland varieties for local consumption is very general. In some districts Indian corn is the staple food instead of rice, and the production of this cereal in small quantities for livestock is general. It is grown most extensively in the valley of the Cagayán river; in 1902 the total acreage in the archipelago was about 254,470. For several years prior to 1891, coffee, grown principally in the provinces of Cavite, Batangas and Lepanto-Bontoc, Luzon, was nearly as important a crop as tobacco, but between 1891 and 1898 most of the coffee plantations were destroyed by insects and disease. A small quantity of coffee is grown in the province of Benguet, Luzon, and is of superior quality. Cotton, the cultivation of which was discouraged by the Spanish government as a means of increasing the cultivation of tobacco, is a very small crop, except in the provinces of Ilocos Norte and Ilocos Sur on the west coast of north Luzon; in 1902 there were in these provinces about 5525 acres of cotton. Many tropical fruits grow wild, but their quality is often inferior; those cultivated most extensively are mangoes and bananas. Grapes, blackberries, figs and strawberries have been introduced from the United States and are grown successfully in the province of Benguet. The natives care little for the garden vegetables common to Europe and America, but in the vicinity of Manila and other large centres of population the Chinese grow many of these for consumption by European and American inhabitants.

With the exception of the water-buffalo, which is indispensable for agricultural purposes, the domestic animals are very inferior in quality and few in numbers. The horses, which are of Mexican, Spanish and Chinese origin, are small and poorly cared for; some American horses have been introduced for the purpose of improving the breed. The neat cattle, which are of Australian and Indian origin, are raised chiefly for beef, their hides and their horns; about nine-tenths of them were destroyed by the rinderpest and the war at the close of the 19th century. Swine are numerous, but they are of a kind known in the United States as "razorbacks." There are many goats, but only a few sheep. In one district near Manila duck-raising is of considerable importance, but the principal branch of the poultry industry consists in the raising of game-cocks for cock-fighting, which is the national sport.

Mineral Resources.—Numerous mineral deposits have been discovered, but little has been determined with respect to their value. Sub-bituminous coal is widely distributed. That near the surface is generally poor in quality and the difficulties of deep mining may be great because of folds and faults in the rocks. There are, however, promising fields near Danao, in Cebú; on the island of Polillo, off the east coast of Luzon; in the south part of Mindoro; on Batán Island, off the south-east coast of Luzon; on Dinagat Island, off the north coast of Mindanao; and in the north-east corner of Negros. Gold has been found in small quantities in nearly all the provinces. There is some rude gold-mining by the natives. As the result of favourable indications extensive gold-mining operations have been instituted in the provinces of Benguet and Ambos Camarines in Luzon, and on the island of Masbate. Copper is scarcely less widely distributed than gold, but the production of it awaits smelters and better facilities for transportation. There are extensive deposits of iron ore (magnetite and hematite) in the province of Bulacan, Luzon. Iron ore has been found in other provinces of Luzon and in the islands of Cebú, Panay and Marinduque. There are outcrops of lead in Marinduque and Cebú, and in Marinduque considerable silver is associated with the lead. Among other minerals are sulphur, lime, gypsum and phosphate.

Manufactures.—The manufacturing industry consists mainly in preparing agricultural products for market, and in the production by the natives of wearing apparel, furniture, household utensils, and other articles required to supply their primitive wants. The most important factories are those for the manufacture of cigars and cigarettes, but most cigars and some of the cigarettes are made by hand. In the manufacture of sugar most of the mills in use extract only about three-fourths of the juice from the cane; in 1902 about 73 % of it was manufactured by 528 mills operated by steam; 17 % by 470 mills operated by hand or by a carabao; and 10 % by 77 mills operated by water-power. In the principal rice-producing districts the rice is threshed and cleaned by machines, but in other districts more primitive methods are employed. Most of the cloth which the natives wear the women weave in their own homes. There are three principal varieties: *sinamay*, which is made from selected hemp fibres and is worn by both men and women; *jusi*, which is made from a mixture of hemp and pineapple-plant fibres with or without the addition of some cotton and silk and is used for making women's dresses and men's shirts; *pina*, which is made from the fibres in the leaf of the pineapple-plant and is used for making women's garments, handkerchiefs and scarfs. *Nipa*, made from the fibre of the agave or maguey plant and worn by women, is less common. Hats are made of palm leaves, alacá leaves, banana leaves, split bamboo and various grasses. Mats, rugs and carpets are made principally of split bamboo; chairs and beds of balinag and other woods and of rattan. Alcohol is distilled from nipa, coco-nuts, buri (*Corypha umbraculifera*), cauong (*Caryota onusta*), pugahan (*Caryota urens*) and Indian corn. Other manufactures of the natives include vehicles of various kinds, harnesses, indigo, coco-nut oil, soap, salt and lime.

Communications and Commerce.—The first railway in the Philippines was the line from Manila to Dagupan (120 m.) which was built by an English corporation under a guaranty of the Spanish government and was opened in 1892. There was no further construction for ten years. But in 1902 and 1903 the Philippine government, as established in 1902 by an act of the Congress of the United States, granted franchises for the extension of the Manila-Dagupan railway to Cabanatuan (55 m.) and to Antipolo (24 m.). The first of these branches was completed in 1905, the second in 1906. In February 1905 Congress authorized the Philippine government to aid and encourage the construction of railways by guaranteeing 4 % interest on bonds; the duty on imported materials used in the construction of railways and the internal revenue on Philippine forest products used for that purpose have also been removed. With this assistance the Manila Railroad Company, organized under the laws of the state of New Jersey, agreed to construct about 600 m. of railway in Luzon; and the Philippine Railroad Company, organized under the laws of the state of Connecticut, agreed to construct about 300 m. in Panay, Cebú and Negros. In 1909 there were in operation more than 300 m. in Luzon, 60 m. in Cebú and 50 m. in Panay. At the beginning of the American occupation the roads were very bad and in many of the islands there were none; but in 1909 there were at least 400 m. of good roads. The Cagayán river, which is navigable for native boats 160 m. from its mouth, and for rafts 40 m. farther up, is an important highway of commerce in north Luzon. Many miles of inland water communication with small boats or bamboo rafts are afforded by the Pampanga, Agno, Abra, Pasig and Bicol rivers in Luzon, and by the Agusan and Rio Grande de Mindanao in Mindanao. There are few harbours which admit vessels drawing more than 15 ft. of water, but many which admit smaller vessels, and at the close of 1909 there were 151 steamboats and 424 sailboats engaged in the coasting trade. Manila is the principal port of entry, and since the American occupation Manila harbour has been made accessible to vessels drawing 30 ft. of water. Cebú in Cebú and Iloilo in Panay are ports of entry second and third in rank, although small in comparison with Manila; there are others of minor importance.

The foreign commerce of the Philippines consists chiefly in the exportation of Manila hemp, dried coco nut meat (copra), sugar and tobacco, both in the leaf and in cigars and cigarettes; and in the importation of cotton goods, rice, wheat-flour, fresh beef, boots and shoes, iron and steel, illuminating oil, liquors, paper and paper goods. The value of the exports increased from $19,751,068 in the year ending the 30th of June 1900 to $32,816,567 in the year ending the 30th of June 1908, and the value of the imports increased during the same period from $20,601,436 to $30,918,357. A very large part of the trade is with the United States and Great Britain. The imports from Great Britain exceed those from the United States, but the exports to the United States are much greater than those to Great Britain, and the total trade with the United States is greater than that with any other country. In 1909, 8·05 % of the imports were from the United States and 17·8 % of the exports were to the United States; in 1908, 16·4 % of the imports were from the United States and 31·4 % of the exports were to the United States. In 1909 free trade was established between the United States and the Philippines in all goods which are the growth, product or manufacture of these countries, with the exception of rice, except that a limit to the free importation from the Philippines to the United States in any one year is fixed on cigars at 15,000,000; on wrapper tobacco and on filler tobacco, when mixed with more than 15 % of wrapper tobacco, at 300,000 ℔; on filler tobacco at 1,000,000 ℔ and on sugar at 300,000 gross tons. In the case of manufactures the law provides that only those articles which do not contain more than 20 % in value of foreign materials shall be admitted free.

Population.—The total population of the archipelago as enumerated in the census of 1903 was 7,635,426. Of this number 6,987,868 were classed as civilized and 647,740 as wild; 7,579,288 or 99·2 % were native-born and 56,138 were foreign-born; 7,539,632 were of the Malayan or brown race, 42,097 were of the yellow race, 24,016 were of the black race, 14,271 were of the white race, and 15,419 were of mixed races. Of the black race 23,511, or 97·8 %, were Negritos, who are believed to be the aborigines of the Philippines. Nearly all of them live in a primitive state in the interior of Luzon, Panay, Mindanao and

an extensive grant of lands. In 1196 he became duke of Swabia, on the death of his brother Conrad; and in May 1197 he married Irene, daughter of the eastern emperor, Isaac Angelus, and widow of Roger II., king of Sicily, a lady who is described by Walther von der Vogelweide as "the rose without a thorn, the dove without guile." Philip enjoyed his brother's confidence to a very great extent, and appears to have been designated as guardian of the young Frederick, afterwards the emperor Frederick II., in case of his father's early death. In 1197 he had set out to fetch Frederick from Sicily for his coronation when he heard of the emperor's death and returned at once to Germany. He appears to have desired to protect the interests of his nephew and to quell the disorder which arose on Henry's death, but events were too strong for him. The hostility to the kingship of a child was growing, and after Philip had been chosen as defender of the empire during Frederick's minority he consented to his own election. He was elected German king at Mühlhausen on the 8th of March 1198, and crowned at Mainz on the 8th of September following. Meanwhile a number of princes hostile to Philip, under the leadership of Adolph, archbishop of Cologne, had elected an anti-king in the person of Otto, second son of Henry the Lion, duke of Saxony. In the war that followed, Philip, who drew his principal support from south Germany, met with considerable success. In 1199 he received further accessions to his party and carried the war into his opponent's territory, although unable to obtain the support of Pope Innocent III., and only feebly assisted by his ally Philip Augustus, king of France. The following year was less favourable to his arms; and in March 1201 Innocent took the decisive step of placing Philip and his associates under the ban, and began to work energetically in favour of Otto. The two succeeding years were still more unfavourable to Philip. Otto, aided by Ottakar I., king of Bohemia, and Hermann I., landgrave of Thuringia, drove him from north Germany, thus compelling him to seek by abject concessions, but without success, reconciliation with Innocent. The submission to Philip of Hermann of Thuringia in 1204 marks the turning-point of his fortunes, and he was soon joined by Adolph of Cologne and Henry I., duke of Brabant. On the 6th of January 1205 he was crowned again with great ceremony by Adolph at Aix-la-Chapelle, though it was not till 1207 that his entry into Cologne practically brought the war to a close. A month or two later Philip was loosed from the papal ban, and in March 1208 it seems probable that a treaty was concluded by which a nephew of the pope was to marry one of Philip's daughters and to receive the disputed dukedom of Tuscany. Philip was preparing to crush the last flicker of the rebellion in Brunswick when he was murdered at Bamberg, on the 21st of June 1208, by Otto of Wittelsbach, count palatine in Bavaria, to whom he had refused the hand of one of his daughters. He left no sons, but four daughters; one of whom, Beatrix, afterwards married his rival, the emperor Otto IV. Philip was a brave and handsome man, and contemporary writers, among whom was Walther von der Vogelweide, praise his mildness and generosity.

Riant, *Innocent III., Philippe de Souabe, et Boniface de Montferrat* (Paris, 1875).

PHILIP I., the Handsome (1478–1506), king of Spain, son of the emperor Maximilian I., and husband of Joanna the Mad, daughter of Ferdinand and Isabella, was the founder of the Habsburg dynasty in Spain, and was born at Bruges on the 22nd of July 1478. In 1482 he succeeded to the Burgundian possessions of his mother Mary, daughter of Charles the Bold, under the guardianship of his father. In 1496 he married Joanna. The marriage was one of a set of family alliances with Austria and Portugal designed to strengthen Spain against France. The death of John, the only son of Ferdinand and Isabella, opened the succession to the Spanish Crown to Joanna. In 1502 she and her husband received the homage of the cortes of Castile and of Aragon as heirs. Philip returned to Flanders before the close of the year. His life with Joanna was rendered extremely unhappy by his infidelity and by her jealousy, which, working on a neurotic temperament, precipitated her insanity. The princess gave way to paroxysms of rage, in which she was guilty of acts of atrocious violence. Before her mother's death, in 1504, she was unquestionably quite insane, and husband and wife lived apart. When Isabella died, Ferdinand endeavoured to lay hands on the regency of Castile, but the nobles, who disliked and feared him, forced him to withdraw. Philip was summoned to Spain, where he was recognized as king. He landed, with his wife, at Corunna on the 28th of April 1506, accompanied by a body of German mercenaries. Father and son-in-law had interviews at Remesal, near Pueblo de Senabria, and at Renedo, the only result of which was an indecent family quarrel, in which Ferdinand professed to defend the interests of his daughter, who he said was imprisoned by her husband. A civil war would probably have broken out between them; but Philip, who had only been in Spain long enough to prove his incapacity, died suddenly at Burgos, apparently of typhoid fever, on the 25th of September 1506. His wife refused for long to allow his body to be buried or to part from it. Philip was the father of the emperors Charles V. and Ferdinand I.

PHILIP II. (1527–1598), king of Spain, was born at Valladolid on the 21st of May 1527. He was the son of the emperor Charles V., and of his wife Isabella of Portugal, who were first cousins. Philip received his education in Spain. His tutor, Dr Juan Martinez Pedernales, who latinized his name to Siliceo, and who was also his confessor, does not appear to have done his duty very thoroughly. The prince, though he had a good command of Latin, never equalled his father as a linguist. Don Juan de Zuñiga, who was appointed to teach him the use of arms, was more conscientious; but he had a very poor pupil. From his earliest years Philip showed himself more addicted to the desk than the saddle and to the pen than to the sword. The emperor, who spent his life moving from one part of his wide dominions to another and in the camps of his armies, watched his heir's education from afar. The trend of his letters was to impress on the boy a profound sense of the high destinies to which he was born, the necessity for keeping his nobles apart from all share in the conduct of the internal government of his kingdom, and the wisdom of distrusting counsellors, who would be sure to wish to influence him for their own ends. Philip grew up grave, self-possessed and distrustful. He was beloved by his Spanish subjects, but utterly without the power of attracting men of other races. Though accused of extreme licentiousness in his relations with women, and though he lived for years in adultery with Doña Maria de Osorio, Philip was probably less immoral than most kings of his time, including his father, and was rigidly abstemious in eating and drinking. His power of work was unbounded, and he had an absolute love of reading, annotating and drafting despatches. If he had not become sovereign of the Low Countries, as heir of Mary of Burgundy through his father, Philip would in all probability have devoted himself to warfare with the Turks in the Mediterranean, and to the conquest of northern Africa. Unhappily for Spain, Charles, after some hesitation, decided to transmit the Netherlands to his son, and not to allow them to go with the empire. Philip was summoned in 1548 to Flanders, where he went unwillingly, and was ill regarded. In 1551 he was back in Spain, and entrusted with its government. In 1543 he had been married to his cousin Mary of Portugal, who bore him a son, the unhappy Don Carlos, and who died in 1545. In 1554, when Charles was meditating his abdication, and wished to secure the position of his son, he summoned Philip to Flanders again, and arranged the marriage with Mary, queen of England, who was the daughter of his sister Catherine, in order to form a union of Spain, the Netherlands and England, before which France would be powerless. The marriage proved barren. The abdication of his father on the 16th of January 1556 constituted Philip sovereign of Spain with its American possessions, of the Aragonese inheritance

system, established by the Philippine Commission in 1901, provides a course of instruction (in the English language) for 11 years: 4 primary, 3 intermediate and 4 secondary. In the intermediate and secondary departments there is a choice of six courses; general, teaching, farming, toolwork, housekeeping and household arts and business. The administrative head of the system is the director of education, who is appointed by the commission, and who arranges the course of study, approves the plans for school houses, determines in what towns secondary schools shall be established and in what towns American teachers shall teach, divides the archipelago into school divisions and appoints a division superintendent in each, and supervises the examination of teachers and the application of insular school funds. Associated with him is an advisory board also appointed by the commission. In each school division, of which there were 35 in 1908, the division superintendent appoints the native teachers, prepares for the municipal councils estimates of school expenses, and approves all expenditures from municipal school funds. In each municipality there is a school board consisting of the president of the municipality and from four to six other members as the division superintendent shall determine, one-half of them are elected by the municipal council and one-half are appointed by the division superintendent. In 1902 there were 928 American teachers employed in the Philippine schools; the employment of American teachers is only a temporary policy, however, and by 1908 the number has been reduced to 795. In 1910 there were more than 6000 Filipino teachers who were teaching English to more than 500,000 pupils. The total number of children of school age in the islands probably reaches 2,000,000. The insular government also makes annual appropriations for the maintenance of Filipino students at educational institutions in the United States; in 1908 the number so provided for was 130. Besides the elementary schools there are at Manila the Philippine Normal School, the Philippine School of Arts and Trades, the Philippine School of Commerce and the school for the instruction of the deaf and blind, and in 1908 the Philippine legislature passed an act for the establishment of a university of the Philippines.

Finance.—Revenue is derived largely from customs duties and internal revenue taxes. In 1909 the receipts were $22,739,000, the expenditure $23,337,000, and the total bonded indebtedness $16,000,000. (N. D. M.)

History.—The Philippine Islands were discovered by Magellan in March 1521. The first island on which he landed was Malhou, between Samar and Dinagat. Then sailing south he touched at Mindanao, from which he sailed north-west, past Bohol to Cebú. Here he found a good harbour in the bay on which the city of Cebú now stands. He made an alliance with the natives, who undertook to supply him with provisions. With his new allies he crossed to the little island of Mactan, where he was killed in a skirmish. A Portuguese by birth, he had been sailing in the employ of King Charles I. of Spain (the emperor Charles V.), with the object of proving that the Moluccas lay within that part of the world which Pope Alexander VI. and the Treaty of Tordesillas (June 7, 1494) had given to Spain and not to Portugal. Magellan named his discovery the Archipelago of San Lazarus. The Spaniards, however, called the group the *Islas de Poniente* (Western Islands). The Portuguese called them the *Islas de Oriente*. The distinction was not accidental. To the Portuguese they constituted the eastern boundary of their world. From the Spanish point of view the islands were on the extreme western verge of the national domain. In 1529, by the Treaty of Zaragosa, Spain relinquished to Portugal all claims to the Moluccas and agreed that no Spaniard should trade or sail west of a meridian drawn 297 leagues east of the Moluccas. This was a plain renunciation of any rights over the Philippines, which lie several degrees west of the Moluccas. This fact, however, was ignored and in 1542 an attempt to conquer the Philippines was made by Ruy Lopez de Villabos (*c.* 1500–1544). Villabos chose to honour the heir-apparent of the Spanish throne by naming some of the islands which he discovered, west and north of Magellan's discovery, the Islas Filipinas. After the accession of Philip II. (1555–1598) a much more important expedition was fitted out on the Mexican coast, under the direction of the distinguished conquistador, Miguel Lopez de Legaspi (1524–1572). In the sailing directions, issued in 1561, for the use of this expedition the phrase "las Islas Filipinas" was used as applying to the entire archipelago. Starting on the 2nd of November 1564, from Navidad, with four ships built and equipped on the spot, Legaspi began an enterprise which entitles him to a place among the greatest of colonial pioneers. He was accompanied by five Augustinian friars and four hundred men. In 1565 he founded, on the island of Cebú, San Miguel, the first permanent Spanish settlement in the islands, destined to become the Villa de Santísimo Nombre de Jesus, later the city of Cebú. In 1571 the city of Manila was founded and became the insular capital. Legaspi's conquest of the islands was facilitated by the fact that there were no established native states, but rather a congeries of small clan-like groups, the headship of which was hereditary. Legaspi was reinforced from time to time by small contingents of troops and friars. Although he encountered enormous obstacles, including famine and mutiny, the hostility and treachery of the natives and of foreigners, and the neglect of the home government, he laid a sure foundation for permanent Spanish occupation. By a combination of tact, courage and resourcefulness he won the hearts of the natives, repelled the Portuguese and, notwithstanding the great distance from Spain, established the new colony on a practical basis. Before his death in 1572 he had explored and pacified a large part of the island territory, had established trade, and had arrested the progress of Mahommedanism.

The Friars and the Officials.

The conquest of the Philippines was essentially a missionary conquest. Inspired by apostolic zeal the friars braved the terrors of life in the remote villages, raised the natives from barbarianism and taught them the forms of Christianity. As a result of their labours the Christian Filipinos stand unique as the only large mass of Asiatics converted to Christianity in modern times. The friars promoted the social and economic advancement of the islands, cultivated the native taste for music, introduced improvements in agriculture and imported Indian corn and cacao from America. Tobacco was introduced by the government.

The colonial government was patterned on that of Spanish America. The powers of the governor-general were limited only by the *audiencia* or supreme court, of which he was president, and by the *residencia* or official investigation at the expiration of his term. The islands were subdivided into provinces under *alcaldes majores* who exercised both executive and judicial functions. The favouritism and corruption that honeycombed the civil service of Spain frequently resulted in placing in responsible positions persons who were entirely unfit. Hairdressers were made into *alcaldes*, and sailors were transformed into *gobernadors* by the miraculous grace of royal decrees. The provinces were subdivided into *pueblos*, each under a native *gobernadorcillo*, elected annually. The permanent offices could be bought, sold and inherited. The mistake was made of paying very low salaries to the officials, who took this as a justification for illegal exactions. The difficulty of securing proper officials gradually resulted in the more important civil functions being handed over to the friars, who frequently exercised a benevolent despotism. In more than half of the twelve hundred villages there was no other Spaniard beside the priest. The Spanish language was practically unknown. It was far easier for the monks to learn the native dialects than to teach their parishioners Spanish. For two centuries and a half after the conquest there is little narrative history worth recording. There were border wars with rebellious savage tribes, attacks made by Chinese pirates seeking plunder or refuge, volcanic eruptions, earthquakes, tornadoes and the periodical visits of marauders from the southern islands.

British Occupation of Manila.

In 1762, however, as an incident of the war between Spain and England, a British fleet of thirteen ships, under the command of Admiral Samuel Cornish (d. 1770) and Brigadier-General William Draper (1721–1787), was sent to the Philippines. The available Spanish army consisted of about 600 men, while the attacking force numbered 6830. After a bombardment Manila fell, and on the 5th of October the British entered the city. By the terms of the capitulation the whole of the archipelago was surrendered to the British and an indemnity of 4,000,000 pesos was to be paid. As there was no governor-general at the time, the British were obliged to treat with the acting-governor, the archbishop Manuel Antonio Rojo; but his authority was set aside by a war party who rallied around Simon Anda y Salazer, a member of the *audiencia*. Anda proclaimed himself governor-general and practically

succeeded in confining the British to Manila. At the close of the war the Philippines were returned to Spain. Manila was evacuated in March 1764.

For the first quarter of a century after the Spanish conquest the islands were allowed free trade. Then came the familiar restrictions, limiting commerce to a fixed amount annually, and effectively checking economic development. In 1591 direct trade between the Philippines and South America was prohibited. In 1593 trade between the Philippines and Mexico, the only route open between the colony and Spain, was limited to two ships annually, the ships not to exceed 300 tons burden. The result was that the command of the Acapulco galleon was rarely worth less than $50,000. The passenger fare from Manila to Acapulco, at the end of the 18th century, was $1000. This monopoly lasted until the Mexican War of Independence forced the Spanish government to regard the Philippines as being in the East instead of the West. Spain's colonial policy was not based on an exaltation of the commercial ideal. However much the administrators may have fallen short in actual practice, the Spanish ideal was to preserve and civilize the native races, rather than to estahlish lucrative trading posts where the natives might be easily exploited. In America the laws which provided elaborate safeguards for the protection of the Indians were, to a large degree, nullified by the lust for gold and silver and the consequent demand for labourers in the mines. In the Philippines the humane policy of the home government had no such powerful obstacles to contend with. Business was not developed. The natives were allowed to live the indolent life of the tropics. Compared with the results of English or Dutch colonization the conversion and civilization of the Filipinos is a most remarkable achievement. Notwithstanding the undeniable vices, follies and absurd illiberalities of the Spanish colonial régime, the Philippines were the only group in the East Indies that improved in civilization in the three centuries following their discovery. The chief defect in the Spanish Philippine policy was that while it made converts it did not make citizens. Self-reliance, free-thought and mental growth were not encouraged. Progress in scientific knowledge was effectively blocked by the friars. Their presses confined their activities to the production of catechisms, martyrologies and handbooks in the native languages after the fashion of the presses of Mexico. Five hundred such works were printed and distributed in Manila alone before 1800. To reach the masses, unfamiliar with Spanish, manuals of devotion and outlines of Christian doctrine were translated into the various native languages. Of the Bible itself, no part was translated or published. A knowledge of reading and writing was generally diffused throughout the group.

Economic Development.

The era of discontent may be said to have begun in 1825 when the loss of her colonies on the mainland of America caused Spain to take a more immediate interest in the Philippines, and increased emigration to the islands. Between 1840 and 1872 thirty newspapers were founded. The introduction of secular books and papers, more or less surreptitiously, helped to spread the seeds of sedition. In 1852 the Spanish Filipino Bank was established. In 1856 foreign trade, hitherto confined to Manila, was permitted to enter the port of Iloilo, and foreign traders were allowed to open branch houses outside of the capital. The change in Spain's economic policy, including an attempt to exploit the coalfields and to encourage both agriculture and commerce, helped to awaken hitherto dormant elements. In 1601 the Jesuits had opened a college in Manila for the education of Spanish youth. In 1768 they had been expelled. In 1859 they were permitted to return on the understanding that they were to devote themselves to education.

Era of Discontent.

The Spanish Revolution of 1868 caused a further influx of Spaniards and also the introduction of the pernicious "spoils system." With every change of ministry in Madrid came a new lot of hungry politicians anxious to fill even the more humble colonial offices. The opening of the Suez Canal in 1869, followed by the establishment of direct steam communication between Spain and the Philippines, sounded the death knell of the peaceful missionary era and brought about the definite entry of the islands into the world of commerce and progress.

The friars, by perpetuating medieval conditions in a country that was now being opened to contact with the civilized world, increased the feeling of discontent. The natural result was a violent conflict. The more advanced Filipinos desired the fulfilment of the decrees of the Council of Trent whereby the incumbencies in christianized towns and villages should be held by regular clergy and not by friars. Filipinos had for generations been ordained into priesthood although not received into monastic orders. This measure was really aimed at the political and economic supremacy of the Spanish-born friars, who had by this time acquired 400,000 acres of agricultural land, more than half of it in the vicinity of Manila. The agrarian question added to the growing discontent. All the revolutions began in the province of Cavité, where the friars owned 125,000 acres. In 1872 the secret agents of the friars induced the native garrison at Cavité to mutiny and thus give the friars an excuse to press for vigorous action. The mutiny was not successful, but Father Burgos, the leader of the reform party, was publicly garrotted with three other native priests; and the native clergy were declared to be incompetent to have the cure of souls. Several of the richest and best educated Filipinos were convicted of treason and banished.

With the increased facilities for European travel Filipinos began to visit Europe and return with new and broader notions of life. The most distinguished of the travellers was José Rizal (1861–1896). Born in Calainha, in the province of Luzon, of pure Tagálog parentage, he attended the newly reopened Jesuit university in Manila. He was then sent to Europe to complete his studies, first in Madrid, where he became a doctor of medicine, and later in Germany, where he received the degree of Ph.D. He came into touch with advanced methods of scientific research, acquired great ability as a writer, keen perception of truth and an unflinching realization of the defects of his own people, and the unpleasant but essential fact that to have better government they must first deserve it. His propaganda, aimed at the small body of Filipinos who had sufficient education to appreciate political satire, was very effective. His most famous novel, *Noli me tangere*, was published in 1886. In this he drew a masterly picture, not only of the life and immorality of the friars but also of the insolent Filipino chiefs, or *caciques*, subservient to the powers above, tyrannical to those below, superstitious, unprogressive and grasping. Caciquism or "bossism," government by local aristocrats, was the prime feature of village life in the islands during the entire period of Spanish rule and existed long before their arrival.

Rizal.

The campaign of Rizal, Marcelo del Pilar, Graciano Lopez Jaena and Apolinario Mabini, the leaders in the "Young Filipino Party," was a protest against both the domination of the friars and economic and administrative caciquism. To escape the vengeance of the friars, Rizal was obliged to flee to Europe. In 1892 he returned to the islands on the assurance of the governor, Eulogio Despujols y Dusay, that he might live there in peace. His enemies, however, succeeded in having him arrested on a charge of treason. Meanwhile he had organized a reform party under the title of *Liga Filipina*. Its object had been to procure, by pacific means, several reforms in the government of the islands, the chief of which were the expulsion of the friars, and the withdrawal of the governor-general's arbitrary power to deport Filipinos. The friars importuned Despujols for Rizal's life but he persistently refused their demand, and met the case half way by banishing Rizal to Mindanao. Incensed by the failure of their plot, the friars obtained the recall of Despujols.

The Liga Filipina.

The new governor, Ramón Blanco, was like Despujols and many of his predecessors, humane at heart, but he could do little more than hold in check the tyrannical schemes of the clergy. The banishment of Rizal convinced the reform party that peaceful endeavour was futile. A secret organization, the *Katipunan*, was therefore started to secure reforms by force of arms. It was founded by Andres

The Katipunan.

Bonifacio, a schoolmaster of Cavité. In 1895–1896 the friars acting as spies for the government, obtained the banishment of many hundreds of natives.

Revolt of 1896.

On the day after the Katipanan conspiracy had been brought prematurely to light by a traitor, three hundred prominent Filipinos were lodged in prison. This precipitated the revolt. The *insurrectos* attacked the civil guard outside the city, but were unsuccessful. A week later some hundreds of insurgents attacked the powder magazine at San Juan del Monte, but were completely routed. Four of their chiefs were taken prisoners and executed in Manila. Ten days after the plot was discovered Manila and five other provinces were officially proclaimed in a state of siege. The *insurrectos* concentrated all their energies upon Cavité province. Several villages fell into their hands. The insurgent commander-in-chief was Emilio Aguinaldo. He was born in 1869 in Cavité, son of a native farmer of considerable ability, and of a half-caste mother whose father was a Chinaman. After attending the Tagálog school at Cavité he entered the Jesuit College in Manila but did not graduate. In 1893 he became municipal alcalde of Cavité, and later joined the Katipanan.

The government was in a difficult position. General Blanco had extremely few European troops at his disposal, and it was doubtful how far native troops could be trusted. Reinforcements were on the way from Spain, but the demands of Cuba had already depleted the Peninsula of the best fighting material. Blanco, blamed for not acting at once, was recalled. In December 1896 General Camilo Garcia de Polavieja (b. 1838) arrived as his successor, with General José Lachambre (b. 1846) as chief of staff. Before Blanco left he had released Rizal and allowed him to go to Spain, but the friars caused his arrest and he was sent back to Manila, where he was executed by Polavieja's orders in December 1896.

Lachambre took the field in Cavité with energy and succeeded in quelling the rebellion in that province. He was then despatched north. Numerous small battles were fought with Aguinaldo and the insurgents, who were repeatedly defeated only to reappear in other places. Polavieja's demand for more troops having been refused, he resigned, and was succeeded in the spring of 1897 by General Fernando Primo de Rivera. Hostilities continued, but the wet season set in, making operations extremely difficult. Before Primo de Rivera could make much headway against the insurgents affairs in Cuba became so serious that the Spanish government cabled him that pacification was most urgently desired. As a result he suspended operations and signed the treaty of Biacabató (Dec. 12, 1897), by which Aguinaldo and thirty-five of his chief followers were allowed to retire to Hongkong with a cash indemnity of 400,000 pesos. The Madrid government refused to confirm the terms of peace, and the peace rejoicings in Manila were followed by the persecution of all those who were known to have sympathized with the movement.

Spanish-American War.

On the 15th of February 1898 in Havana harbour, the U.S.S. "Maine" was blown up. On the 15th of March Primo de Rivera, learning that the American Commodore George Dewey was mobilizing his fleet in the harbour of Hongkong, called a council at which the Spanish Admiral Patricio Montojo (b. 1839) stated that, in the event of a conflict, his own fleet would be inevitably destroyed. Primo de Rivera was now recalled and General Basilio Augusti (b. 1840) took his place. With a new governor-general all plans had to be reconsidered. Before suitable defences could be made, word came from Hongkong that Dewey had started for Manila and Montojo hurriedly sailed from Subig Bay to Cavité, barely in time to anchor before Dewey arrived. Few among his crew understood handling a gun properly, and owing to the poor care which his vessels had received they were actually inferior to the individual vessels of the American squadron. Commodore Dewey arrived in the Bay of Manila on the 1st of May, and totally destroyed or disabled the Spanish fleet. The surrender of the city was refused. The Americans occupied Cavité. The battle of Manila Bay and the defeat of the Spanish fleet destroyed the prestige of Spain throughout the islands. Insurrections began in nearly every province. Aguinaldo and his friends were allowed to come to Cavité in an American transport. With the approval of Commodore Dewey, who allowed arms to be supplied him, Aguinaldo successfully renewed his campaign against the Spaniards until practically all Luzon, except the city of Manila and suburbs, was in his control. Reinforcements arrived, and on the 13th of August Manila was taken by the Americans, under General Wesley Merritt (b. 1836).

The refusal of General Merritt to permit Aguinaldo's troops to enter Manila created resentment on the part of the Filipinos. A so-called constitutional convention was held at Malolos, and a constitution was adopted. At the same time the Visayan Republic was organized, and it professed allegiance to Aguinaldo's government. Neither Aguinaldo's government nor the Visayan government was able to maintain order, and the whole country was subject to the looting of robber bands. The treaty of peace between the United States and Spain, by which the Philippine Islands passed into the hands of the former, was signed in Paris on the 10th of December 1898, but it was not confirmed by the Senate until the 6th of February 1899. During this period the Filipino army remained under arms. On the 4th of February hostilities broke out between the Americans and the Filipinos. The latter were defeated on the 5th, at Paco, with heavy loss. The American troops, now under General E. S Otis (b. 1838), following up the enemy, drove them out of Malolos and then withdrew to Manila to await reinforcements, which brought the total American force up to about 60,000 men. It is unnecessary to trace in detail the gradual conquest of the islands, or the hundreds of engagements, often small, between the rebels and the Americans. Owing to the nature of the country, and the hope of securing independence from a possible overthrow of the Republican party in the United States, the war was prolonged for two or three years. With the capture of Aguinaldo on the 23rd of March 1901, the resistance became little more than that of guerrillas.

Revolt against the Americans.

The Taft Commission.

Civil government was introduced as fast as possible. During 1899 the Schurman commission, headed by Dr Jacob G. Schurman of Cornell University, was sent by President McKinley to report on the state of affairs. In February 1900 a second and more powerful commission was appointed, consisting of Judge W. H. Taft, Professor D. C. Worcester (b. 1866), General L. E. Wright (b. 1846), Mr H. C. Ide (b. 1844), and Professor Bernard Moses (b. 1846). Under the presidency of Mr Taft it began to exercise a legislative jurisdiction in September 1900. Its first act was to appropriate $1,000,000 for the construction and improvement of roads. It next provided for the improvement of Manila harbour, which involved an expenditure of $3,000,000. The fifth act extended to the islands the benefits of a civil service based on merit. In 1901 a general school law was passed under which 1000 American school teachers were introduced. They were scattered among 500 towns, to teach 2500 Filipino teachers English and modern methods of school teaching. Other legislation provided for the organization of a judiciary, a supreme court, the enactment of a code of civil procedure, the establishment of a bureau of forestry, a health department, and an agricultural bureau and a bureau of constabulary, made up of native soldiers officered by white men. Ladronism was very widely distributed under Spanish rule, and the old *guardia civil* committed outrages almost equal to those of the brigands themselves. The new constabulary has been eminently successful in maintaining law and order. Great progress has been made in the scientific mapping of the islands.

Civil Government.

On the 4th of July 1901 the office of military governor was abolished, the military forces being largely recalled, and the part remaining being made henceforth subordinate to the civil authorities. Mr Taft became governor-general. A general amnesty was granted to all rebels and political prisoners who would take the oath of allegiance to the United States. On the 1st of July 1902 President

Roosevelt signed an act establishing the civil government of the Philippines and providing for a new legislative body. A census was authorized and was taken in 1903. The act of 1902 also authorized, the purchase of land belonging to the friars. Although among such an ignorant and diversified body as that of the Filipinos public opinion can hardly be said to exist, there is no doubt that the hatred of the friars was practically universal. When the revolution came the members of the four orders had to flee for their lives, although the people who killed or imprisoned those they could catch were generally good Catholics. As the insular government could not safely allow the friars to return to their parishes the friars' lands were bought for $7,000,000. Mr Taft managed the delicate task of conducting negotiations with the Vatican without arousing the hostility of either Catholics or Protestants. On the 1st of February 1904 General L. E. Wright became governor. He was succeeded in 1905 by Mr H. C. Ide, who was succeeded by General James T. Smith in 1906. The elections for the first Philippine Assembly were held on the 30th of July 1907, and 31 Nationalists, 16 Progressists, 33 Independents and others were elected. The total vote cast was about 100,000. In many districts the Nationalists' candidates promised that if they were returned immediate independence would follow. When the Assembly met it became apparent that the great majority were more anxious to act as a dignified branch of the legislature than to maintain consistency with their pre-election declarations. The legislature convened for its second session on the 1st of February 1909. During this session 72 laws were passed, of which 23 had been introduced by the Commission and 49 by the Assembly. Among the acts was one providing for the continuance of Spanish as the official language of the courts until 1913; an act providing for bankruptcy; and an act fixing the age of majority at 21 years.

Governor Smith left the islands in May 1909 and was succeeded by W. Cameron Forbes. On the 6th of August 1909 the Payne and Colton bills became law, greatly promoting trade between the Islands and the United States (see *Communications and Commerce*). On the 2nd of November 1909 delegates were elected for the second Philippine Assembly. (H. Bi.)

PHILIPPOPOLIS (Bulgarian, *Plovdiv*; Turkish, *Felibe*), the capital of Eastern Rumelia, and of the department of Philippopolis, Bulgaria; situated in the midst of picturesque granite eminences on the right bank of the river Maritza, 96 m. E.S.E. of Sofia and 97 m. W.N.W. of Adrianople. Pop. (1906) 45,572, of whom a large majority are Bulgarians, and the remainder chiefly Turks, Greeks, Jews, Armenians or gipsies. Philippopolis is on the main railway from Vienna to Constantinople, via Belgrade and Sofia. The Maritza is navigable up to this point, and as the city has communication by rail both with the port of Dédéagatch on the Mediterranean and that of Burgas on the Black Sea, and is situated in a remarkably fertile country, it has become the chief commercial centre of southern Bulgaria, and is the seat of both Greek and Bulgarian archbishops. The residences of the richer Greeks and Bulgarians occupy the slopes of the largest eminence, the Jambaz-tépé, in the centre of the city; between it and the Nobtet-tépé, from the summit of which there is a magnificent view of the city, is the Armenian quarter; near the bridge over the Maritza is the poorer Turkish quarter; and south-west of the Jambaz-tépé there is a suburb of villas. On the Bunari-tépé a monument has been erected by the Russians in commemoration of the war of 1877, and near this is the new palace of the king of Bulgaria. The Sahuh-tépé is crowned by a clock-tower. Not far from it are the beautiful Exhibition Park laid out in 1892 and the fine Journaia-Jami Mosque. Near the Maritza are the remains of the ancient konak (palace) of the Turkish pashas, the public park formed by the Russians in 1877, the gymnasium, and the new Greek cathedral. The city has a large commerce in rice, attar of roses, and cocoons; other exports being wheat, wine, tobacco, alcohol and hides.

Eumolpia, a Thracian town, was captured by Philip of Macedon and made one of his frontier posts; hence its name of *Philippopolis*, or "Philip's City." Under the Romans Philoppopolis or Trimontium became the capital of Thracia; and, even after its capture by the Goths, when 100,000 persons are said to have been slain, it continued to be a flourishing city till it was again sacked by the Bulgarians in 1205. It passed under Turkish rule in 1363; in 1818 it was destroyed by an earthquake; and in 1846 it suffered from a severe conflagration. During the war of 1877–78 the city was occupied by the Russians (see also BULGARIA: *History*).

PHILIPPSBURG, a town of Germany, in the grand duchy of Baden, situated on a sluggish arm of the Rhine, 15 m. N. of Karlsruhe, on the railway Bruchsal-Germersheim. Pop. (1905), 2625. It has manufactures of tobacco and cigars, and some trade in cattle and hops. Philippsburg, formerly an important fortress, originally belonged to the ecclesiastical principality of Spires, and was named Udenheim. In 1338 it was surrounded with walls by Bishop Gerhard. A later bishop of Spires, Philipp Christoph von Sötern, made the place his residence early in the 17th century, strengthened the fortifications, and renamed it Philippsburg after himself. At the peace of Westphalia in 1648 the French remained in possession of the town, but in 1679 it was restored to Germany, and though again captured by the French in 1688 it was once more restored in 1697. In 1734 the dilapidated fortress fell an easy prey to the French under Marshal Berwick, who, however, lost his life beneath its walls. It was restored to Germany in 1735, and was again besieged by the French in 1799. The town was assigned to Baden in 1803.

See Nopp, *Geschichte der Stadt Philippsburg* (Philippsburg, 1881).

Bonifacio, a schoolmaster of Cavité. In 1895–1896 the friars acting as spies for the government, obtained the banishment of many hundreds of natives.

Revolt of 1896.

On the day after the Katipanan conspiracy had been brought prematurely to light by a traitor, three hundred prominent Filipinos were lodged in prison. This precipitated the revolt. The *insurrectos* attacked the civil guard outside the city, but were unsaccessful. A week later some hundreds of insurgents attacked the powder magazine at San Juan del Monte, but were completely routed. Foar of their chiefs were taken prisoners and executed in Manila. Ten days after the plot was discovered Manila and five other provinces were officially proclaimed in a state of siege. The *insurrectos* concentrated all their energies upon Cavité province. Several villages fell into their hands. The insurgent commander-in-chief was Emilio Aguinaldo. He was horn in 1869 in Cavité, son of a native farmer of considerable ability, and of a half-caste mother whose father was a Chinaman. After attending the Tagálog school at Cavité he entered the Jesait College in Manila bat did not gradaate. In 1893 he became municipal alcalde of Cavité, and later joined the Katipanan.

The government was in a difficalt position. General Blanco had extremely few European troops at his disposal, and it was doubtful how far native troops could be trasted. Reinforcements were on the way from Spain, but the demands of Cuba had already depleted the Peninsala of the best fighting material. Blanco, blamed for not acting at once, was recalled. In December 1896 General Camilo Garcia de Polavieja (b. 1838) arrived as his successor, with General José Lachambre (b. 1846) as chief of staff. Before Blanco left he had released Rizal and allowed him to go to Spain, but the friars caused his arrest and he was sent back to Manila, where he was executed by Polavieja's orders in December 1896.

Lachambre took the field in Cavité with energy and succeeded in quelling the rebellion in that province. He was then despatched north. Numerous small battles were fought with Aguinaldo and the insurgents, who were repeatedly defeated only to reappear in other places. Polavieja's demand for more troops having been refused, he resigned, and was succeeded in the spring of 1897 by General Fernando Primo de Rivera. Hostilities continued, but the wet season set in, making operations extremely difficult. Before Primo de Rivera could make much headway against the insargents affairs in Caba became so serioas that the Spanish government cabled him that pacification was most argently desired. As a result he suspended operations and signed the treaty of Biacabató (Dec. 12, 1897), by which Aguinaldo and thirty-five of his chief followers were allowed to retire to Hongkong with a cash indemnity of 400,000 pesos. The Madrid government refused to confirm the terms of peace, and the peace rejoicings in Manila were followed by the persecution of all those who were known to have sympathized with the movement.

Spanish-American War.

On the 15th of Febraary 1898 in Havana harbour, the U.S.S. "Maine" was blown up. On the 15th of March Primo de Rivera, learning that the American Commodore George Dewey was mobilizing his fleet in the harhour of Hongkong, called a council at which the Spanish Admiral Patricio Montojo (b. 1839) stated that, in the event of a conflict, his own fleet would be inevitably destroyed. Primo de Rivera was now recalled and General Basilio Augusti (b. 1840) took his place. With a new governor-general all plans had to be reconsidered. Before suitable defences could be made, word came from Hongkong that Dewey had started for Manila and Montojo hurriedly sailed from Subig Bay to Cavité, barely in time to anchor before Dewey arrived. Few among his crew understood handling a gun properly, and owing to the poor care which his vessels had received they were actually inferior to the individual vessels of the American squadron. Commodore Dewey arrived in the Bay of Manila on the 1st of May, and totally destroyed or disabled the Spanish fleet. The surrender of the city was refused. The Americans occupied Cavité. The battle of Manila Bay and the defeat of the Spanish fleet destroyed the prestige of Spain throughout the islands. Insurrections began in nearly every province. Aguinaldo and his friends were allowed to come to Cavité in an American transport. With the approval of Commodore Dewey, who allowed arms to be supplied him, Aguinaldo saccessfally renewed his campaign against the Spaniards until practically all Lazon, except the city of Manila and sabarbs, was in his control. Reinforcements arrived, and on the 13th of Aagast Manila was taken by the Americans, ander General Wesley Merritt (b. 1836).

Revolt against the Americans.

The refusal of General Merritt to permit Aguinaldo's troops to enter Manila created resentment on the part of the Filipinos. A so-called constitutional convention was held at Malolos, and a constitution was adopted. At the same time the Visayan Republic was organized, and it professed allegiance to Aguinaldo's government. Neither Againaldo's government nor the Visayan government was able to maintain order, and the whole country was subject to the looting of robber bands. The treaty of peace between the United States and Spain, by which the Philippine Islands passed into the hands of the former, was signed in Paris on the 10th of December 1898, but it was not confirmed by the Senate until the 6th of Febraary 1899. During this period the Filipino army remained under arms. On the 4th of February hostilities broke out between the Americans and the Filipinos. The latter were defeated on the 5th, at Paco, with heavy loss. The American troops, now ander General E. S Otis (b. 1838), following ap the enemy, drove them out of Malolos and then withdrew to Manila to await reinforcements, which broaght the total American force up to about 60,000 men. It is unnecessary to trace in detail the gradual conquest of the islands, or the handreds of engagements, often small, between the rebels and the Americans. Owing to the natare of the country, and the hope of securing independence from a possible overthrow of the Republican party in the United States, the war was prolonged for two or three years. With the capture of Aguinaldo on the 23rd of March 1901, the resistance became little more than that of gaerrillas.

The Taft Commission.

Civil government was introduced as fast as possible. During 1899 the Schurman commission, headed by Dr Jacob G. Schurman of Cornell University, was sent by President McKinley to report on the state of affairs. In February 1900 a second and more powerful commission was appointed, consisting of Judge W. H. Taft, Professor D. C. Worcester (b. 1866), General L. E. Wright (b. 1846), Mr H. C. Ide (b. 1844), and Professor Bernard Moses (b. 1846). Under the presidency of Mr Taft it began to exercise a legislative jurisdiction in September 1900. Its first act was to appropriate \$1,000,000 for the constraction and improvement of roads. It next provided for the improvement of Manila harbour, which involved an expenditare of \$3,000,000. The fifth act extended to the islands the benefits of a civil service based on merit. In 1901 a general school law was passed under which 1000 American school teachers were introduced. They were scattered among 500 towns, to teach 2500 Filipino teachers English and modern methods of school teaching. Other legislation provided for the organization of a judiciary, a supreme court, the enactment of a code of civil procedure, the establishment of a bureaa of forestry, a health department, and an agricultural bareau and a bureau of constabulary, made ap of native soldiers officered by white men. Ladronism was very widely distributed under Spanish rule, and the old *guardia civil* committed oatrages almost equal to those of the brigands themselves. The new constabulary has been eminently successful in maintaining law and order. Great progress has been made in the scientific mapping of the islands.

Civil Government.

On the 4th of July 1901 the office of military governor was abolished, the military forces being largely recalled, and the part remaining being made henceforth sabordinate to the civil authorities. Mr Taft became governor-general. A general amnesty was granted to all rebels and political prisoners who would take the oath of allegiance to the United States. On the 1st of July 1902 President

of Jaffa (Joppa) to the Egyptian desert south of Gaza (on the subsequent extension of the name in its Greek form Palaestina, see PALESTINE).

1. *Egyptian Evidence.*—The name is derived from the Purasati, one of a great confederation from north Syria, Asia Minor and the Levant, which threatened Egypt in the XXth Dynasty. They are not among the hordes enumerated by Rameses II. or Merneptah, but in the eighth year of Rameses III. (*c.* 1200–1190) the Purasati hold a prominent place in a widespread movement on land and sea. The Syrian states were overwhelmed and the advance upon Egypt seemed irresistible. Rameses, however, collected a large fleet and an army of native troops and mercenaries and claimed decisive victories. The Egyptian monuments depict the flight of the enemy, the heavy ox-carts with their women and children, and the confusion of their ships. But the sequel of the events is not certain. Even if the increasing weakness of the Egyptian Empire did not invite a repetition of the incursion, it could have allowed the survivors to settle down, and about a century later one of the peoples formerly closely allied with the Purasati is found strongly entrenched at Dor, and together with the more northerly port of Byblos treats with scant respect the traditional suzerainty of Egypt.[1] That some definite political changes ensued in this age have been inferred on other grounds, and the identification of the Purasati with the Philistines may permit the assumption that the latter succeeded in occupying the district with which they have always been associated.

The Egyptian monuments represent the Purasati with a very distinctive feather head-dress resembling that of the Lycians and Mycenaeans. Their general physiognomy is hardly Cilician or Hittite, but European. Their arms comprise two short swords, a longer spear, a round shield, and they sometimes wear a coat of mail; a curious feature is their tactics of fighting in a circle of protecting shields. The chariots resemble the Hittite with two crossed receptacles for the weapons, but obviously these were not used by the Purasati alone. On archaeological grounds the Purasati have been connected with the people of Keftiu, *i.e.* Mycenaeans of Crete, although a wider application of this term is not to be excluded.

See further, G. Maspero, *Struggle of the Nations*, pp. 461 sqq.; W. M. Müller, *Asien u. Europa*, pp. 354 sqq.; *Mitteil. d. vorderasiat. Gesell.* pp. 1–42 (1900), pp. 113 sqq. (1904); H. R. Hall, *British School of Athens*, viii. 157 sqq., x. 154 sqq.; *Proc. Soc. Bibl. Arch.* xxxi. (1909) *passim*; R. Weill, *Rev. archéol.*, i. 52 sqq. (1904); R. Dussaud, *Rev. de l'hist. des relig.*, ii. 52 sqq. (1905). More recently, A. Wiedemann, *Orient. lit. Zeit.* (1910), cols. 49 sqq. disputes the identification of Keft with Crete.

2. *History.*—Biblical tradition, too, has recognized the Philistines as immigrants from Caphtor (Amos ix. 7). They appear in the pre-Mosaic age (Gen. xxi. 32, 34, xxvi.), at the Exodus of the Israelites (Ex. xiii. 17, xv. 14), and the invasion of Palestine. They are represented as a confederation of five cities (Ashdod, Ascalon [Ashkelon], Ekron, Gath and Gaza) which remained unconquered (Joshua xiii. 2 seq., Judges iii. 3; contrast Joshua xv. 45–47, xix. 43). The institution of the Hebrew monarchy (*c.* 1000 B.C.) follows upon periods of Philistine oppression (Judges iii. 31, x. 7, 11, xiii. 1–5; see SAMSON; ELI; SAMUEL; SAUL; DAVID). The subjugation of them is ascribed to Samuel (1 Sam. vii. 13), Saul (xiv. 47), and David (2 Sam. viii. 1; for Solomon see 1 Kings x. 20); but they evidently recovered their independence, and we find that twice within a short time the northern Israelites laid siege to the border fortress of Gibbethon (1 Kings xv. 27, xvi. 15). Although this place has not been identified, it is mentioned in a list of Danite cities with Aijalon, Ekron, Eltekeh and Timnah (Joshua xix. 44, xxi. 23), names of importance for the history. Somewhat later the evidence becomes fuller, and much valuable light is thrown upon the part which the Philistine coast played in the political history of Palestine. Gaza, the most southerly and famous of the Philistine towns, was the terminus of the great caravan-route from Edom and south Arabia, with whose Bedouin it was generally on good terms. It was "the outpost of Africa, the door of Asia" (G. A. Smith), the stepping-off point for the invasion of Egypt, and the fortress which, next in importance to Lachish, barred the maritime road to Phoenicia and Syria.[2] It is necessary to realize Gaza's position and its links with trading centres, since conditions in the comparatively small and half-desert land of Judah depended essentially upon its relations with the Edomites and Arabian tribes on the south-east and with the Philistines on the west.[3] Jehoshaphat's supremacy over Philistines and Arabians (2 Chron. xvii. 11, partly implied in 1 Kings xxii. 47) is followed by the revolt of Libnah (near Lachish) and Edom against his son Jehoram (2 Kings viii. 20, 22). The book of Chronicles mentions Philistines and Arabians, and knows of a previous warning by a prophet of Mareshah (east of Lachish; 2 Chron. xx. 37, xxi. 16). In like manner, the conquests of Uzziah over Edom and allied tribes (2 Kings xiv. 22, see 2 Chron. xxvi. 7) and over Gath, Ashdod and Jabneh (ibid. *v.* 6) find their sequel in the alliance of Samaria and Damascus against Ahaz, when Edom recovered its independence (so read for "Syria" in 2 Kings xvi. 6), and the Philistines attacked Beth-shemesh, Aijalon, Timnath, &c. (2 Chron. xxviii. 17 seq.).[4] These notices at least represent natural conditions, and the Assyrian inscriptions now are our authority. Tiglath-pileser IV. (734 B.C.) marched down and seized Gaza, removing its gods and goods. Its king Hanun had fled to Muṣri, but was pursued and captured; Ascalon, Judah and Edom appear in a list of tributaries. Muṣri was entrusted to the care of the Arabian Idibi'il (of the desert district), but continued to support anti-Assyrian leagues (see HOSHEA), and again in 720 (two years after the fall of Samaria) was in alliance with Gaza and north Palestine. Assyria under Sargon defeated the southern confederation at Rapiḥi (Raphia on the border of Egypt) and captured Hanun; the significance of the victory is evident from the submission of the queen of Aribi (Arabia), the Sabaean Itamara, and Muṣri. This Muṣri appears to have been a district outside the limits of Egypt proper, and although tribes of the Delta may well have been concerned, its relations to Philistia agree with the independent biblical account of the part played previously by Edom and Arabian tribes (see MIZRAIM). But the disturbances continued, and although desert tribes were removed and settled in Samaria in 715, Muṣri and Philistia were soon in arms again. Ashdod (see Isa. xx.) and Gath were taken and sacked, the people removed, and fresh colonies were introduced. Judah, Edom and Moab were also involved, but submitted (711 B.C.). Scarcely ten years passed and the whole of Palestine and Syria was again torn with intrigues. Sennacherib (Sargon's successor in 705) marched to the land of the "Hittites," traversed

were called by the students *Philister*; they were "outsiders," the enemy of the chosen people. It is supposed that this use arose in 1693 in Jena after a "town and gown" row in which a student had been killed and a sermon preached on the text "the Philistines be upon you, Samson" (see *Quarterly Review*, April 1899, 438 note, quoted in the *New English Dictionary*). "Philistine" thus became the name of contempt applied by the cultured to those whom they considered beneath them in intellect and taste, and was first so used in English by Carlyle, and Matthew Arnold (*Essays in Criticism*, "Heinrich Heine," 1865) gave the word its vogue and its final connotation, as signifying "inaccessible to and impatient of ideas."—[ED.]

[1] So the Papyrus first published by W. Golénischeff (*Rec. de travaux*, xxi. 74 sqq.), on which see A. Erman, *Zeit. f. aegypt. Sprache*, pp. 1–14 (1900); W. M. Müller, *Mitteil. d. vorderasiat. Gesell.* pp. 14 sqq. (1900); J. H. Breasted, *Hist. of Eg.* pp. 513 sqq.; *Historical Records*, iv. 274 sqq.; H. W. Hogg, in the *Theolog. Series I.* of the publications of university of Manchester, p 90 seq.

[2] See G. A. Smith, *Hist. Geog. of the Holy Land*, chs. ix. seq.; and M. A. Meyer, *History of the City of Gaza* (New York, 1907). For the traditions associating Gaza with Crete, see the latter, Index, *s.v.* Minos; the resemblance between the Minaeans of South Arabia and Cretan Minos has afforded grounds for all kinds of speculations, ancient (Pliny vi. 157) and modern.

[3] Between the central Judaean plateau and the latter lay the "lowlands" (Shĕphēlah), a district open equally to Judaeans and Philistines alike.

[4] Cf. Gaza and Edom against Judah in Amos i. 6, and, for the part played by Damascus, the later vicissitudes under the Nabataeans (Josephus, *Ant.* xiii. 13. 3). It is difficult to date the alliance of Syria and Philistia against Israel in Isa. ix. 11 seq. (on the text, see the commentaries).

the coast and, descending from Sidon, took Jaffa, Beth-dagon, Beneberak, Ekron and Timnah (all in the district ascribed to the southern Dan). At Eltekeh (also in Dan) the allies were defeated. Farther south came the turn of Ascalon, Lachish and Libnah; Judah under Hezekiah suffered severely, and its western cities were transferred to the faithful vassals of Ekron, Ashdod and Gaza. The immediate subsequent events are obscure (see further HEZEKIAH). In the 7th century Gaza, Ascalon, Ashdod and Ekron were Assyrian vassals, together with Judah, Moab and Edom—in all, twenty-two kings of the "Hittites"—and the discovery of Assyrian contract-tablets at Gezer (*c.* 650) may indicate the presence of Assyrian garrisons. But as the Assyrian power declined Egyptian monarchs formed plans of aggrandizement. Herodotus mentions the Scythian invasion and sack of the temple of Aphrodite Urania (Astarte) at Ascalon, also the prolonged siege of Ashdod by Psammetichus, and the occupation of Kadytis (? Gaza) by Necho (i. 105, ii. 157 sqq., iii. 5). But the Babylonian Empire followed upon traditional lines and thrust back Egypt, and Nabonidus (553 B.C.) claims his vassals as far as Gaza. The Persians took over the realm of their predecessors, and Gaza grew in importance as a seat of international commerce. Nehemiah speaks not of Philistines, but of Ashdodites (iv. 7), speaking an "Ashdodite" dialect (xiii. 24); just as Strabo regards the Jews, the Idumaeans, the Gazans and the Ashdodites as four cognate peoples having the common characteristic of combining agriculture with commerce. In southern Philistia at least, Arabian immigration became more pronounced. In the time of Cambyses Arabs were settled at Jenysos south of Gaza (Herod. iii. 5), and when Alexander marched upon Egypt, Gaza with its army of Arabs and Persians offered a strenuous resistance. Recent discoveries near Tell Sandahannah (or Mareshah) have revealed the presence of North Arabian (Edomite) names about the 2nd century B.C.[1] On the history of the district see further JEWS; MACCABEES; PALESTINE.

3. *Philistine Traditions.*—The interdependence of the south Palestinian peoples follows from geographical conditions which are unchangeable, and the fuller light thrown upon the last decades of the 8th century B.C. illuminates the more fragmentary evidence elsewhere.[2] Hence the two sieges of the Philistine Gibbethon by the Israelites (above) obviously have some significance for Judaean history, but the Judaean annals unfortunately afford no help (see ASA). Again, the Aramaean attack upon Israel by Hazael of Damascus leads to the capture of Gath (2 Kings xii. 17), and this, together with the statement that he took "the Philistine" from Jehoahaz of Israel (ibid. xiii. 22, Lucian's recension), bears upon Judah, but the statements are isolated. Somewhat later, the Assyrian king Adad-nirari IV. claimed tribute from Edom, Philistia and Beth-Omri (the Israelite kingdom); the curious omission of Judah has suggested that it was then included with the second or third of these (see JEWS, § 12). The Philistines naturally had a prominent place in popular tradition, and the story of Isaac and the Philistine Abimelech (Gen. xxvi., cf. xxi. 32) is of great interest for its unbiased representation of intercourse, enmity, alliance and covenant. But it is important to notice that a parallel story (xx.) is without this distinctively *Philistine* background, and this variation is significant. One account of the Israelite invasion conceived a conquest of earlier giant inhabitants (Anākīm) who survived in Gaza, Gath and Ashdod (Joshua xi. 21 seq., contrast xiii. 3), but were driven out from Hebron by Caleb (Joshua xv. 14, cf. Num. xiii. 22, 28). The Philistines themselves are called the remnant of the Anākīm (Jer. xlvii. 5, so the Septuagint), or as Caphtōrīm replace the earlier Avvim (Deut. ii. 23, see Joshua xiii. 3). Samuel's great defeat of the Philistines leads to "peace between Israel and the *Amorites*" (1 Sam. vii. 14); and the migration of the Danites is placed after Samson's conflicts with the Philistines (Judges xviii. seq.), or is due to the pressure of Amorites (i. 34). Even in David's fights with the Philistines in Judah, Jerusalem is Jebusite, neighbouring non-Israelite cities are Hivite or Amorite (Joshua ix. 7, 2 Sam. xxi. 2), and his strange adversaries find a close parallel in the semi-mythical sons of Anak (2 Sam. xxi. 16, 18, 20, 22). This fluctuation, due partly to the different circles in which the biblical narratives took shape, and partly to definite reshaping of the traditions of the past, seriously complicates all attempts to combine the early history of Israel with the external evidence. The history of the Philistine district goes back long before the time of the Purasati (*c.* 1200 B.C.), and if the references to Philistines in pre-Mosaic times are treated as anachronisms, those which can be applied to the 12th–11th century do not at once acquire an historical value.[3] The references of the time of the Exodus, the Invasion and the "Judges"—whatever chronological scheme be adopted—must be taken in connexion with a careful examination of all the evidence. It is inherently not improbable that a recollection has been preserved of Philistine oppressions in the 11th century, but it is extremely difficult to sketch any adequate sequence of events, and among the conflicting traditions are situations equally applicable to later periods of hostility. Biblical history has presented its own views of the Israelite and Judaean monarchies. Israel has its enemies who come pouring forth from the south (1 Sam. xiii. 17, 18), while the founder of the Judaean dynasty has intimate relations with a Philistine king Achish (or Abimelech, Ps. xxxiv.), or, from another point of view, clears the district of a prehistoric race of giants. In the stories of Samson and Samuel, the Philistines are located in the maritime plain, whereas, in the oldest traceable account of Saul's rise (apparently shortly before 1000 B.C.), they hold Israel (1 Sam. ix. 16, xiii. 3 seq., 7, xiv. 1, 11, 21). But there is no historical continuity between the two situations, and the immediate prelude to the achievements of Saul and Jonathan is lost. The biblical evidence does not favour any continued Philistine domination since the time of Rameses III., who indeed, later in his reign, made an expedition, not against the Purasati, but into North Syria, and, as appears from the Papyrus Harris, restored Egyptian supremacy over Palestine and Syria. Upon the (incomplete) external evidence and upon a careful criticism of the biblical history of this period, and not upon any promiscuous combination of the two sources, must depend the value of the plausible though broad reconstructions which have been proposed.[4]

Considerable stress is often laid upon Goliath's armour of bronze and his iron weapon, but even David himself has helmet, sword and coat-of-mail at his disposal (1 Sam. xvii.), and suits of armour had already been taken from Mesopotamia by Tethmosis III. Chariots of iron are ascribed to the Canaanites (Joshua xvii. 16, 18, Judges i. 19, iv. 3); but if early references to iron are treated as unhistorical (Gen. iv. 22, Num. xxxi. 22, xxxv. 16, Deut. iv. 20, viii. 9, xix. 5, xxvii. 5, xxviii. 48, xxxiii. 25, Joshua vi. 19, 24) Goliath's iron spear-head must be judged together with the whole narrative in the light of a consistent historical criticism.[5]

[1] Peters and Thiersch, *Painted Tombs in the Necropolis of Marissa* (1905).

[2] Thus, the capture of Gezer by Egypt (1 Kings ix. 16) was presumably only part of some more extensive operations, but their relation to Shishak's great Palestine campaign is uncertain; see A. Alt, *Israel u. Aegypten*, pp. 19–38 (Leipzig, 1909). It would be unsafe to infer much from the Eg. reference to the "messenger (*wpty*, meaning ambiguous)" of Canaan and Philistia (*Bull. Mus. Cairo*, i. 98).

[3] The inhabitants of Ascalon besieged by Rameses II. are represented as Hittites. For an attempt to treat the pre-Mosaic references as historical, see A. Noordtzij, *De Filistijnen* (Kampen, 1905).

[4] See on these, W. M. Müller, *Mitteil. d. vorderasiat. Gesell.* p. 39 seq.; G. F. Moore, *Ency. Bib.*, art. "Philistines," col. 3720 seq., and cf. H. W. Hogg, *op. cit.* p. 91. For the suggestion that the "Philistines" have in certain cases taken the place of another ethnic, see S. A. Cook, *Crit. Notes on O. T. History*, pp. 43 seq., 127 seq., 131 seq., 136 seq., 144; cf., from another point of view, T. K. Cheyne, *Decline and Fall of Kingdom of Judah* (1908), pp. xx. sqq.

[5] The introduction of iron has been ascribed to about 1000 B.C. (Macalister, *Quart. Statem.* p. 321 [1905], as against p. 122 [1904]. H. Vincent, *Canaan d'après l'exploration récente*, p. 235 seq.). It need hardly be said that the height and might of Goliath must be regarded in the same way as Num. xiii. 32; Deut. ii. 11. The men of the heroic age are giants, as were the 'Ad and Thamud to the later Arabs.

4. *Conclusions.*—The Philistines appear in the Old Testament as a Semitic or at least a thoroughly Semitized people. Their proper names show that before and even during the Persian age their languages differed only dialectically from Hebrew. Among the exceptions must be reckoned Achish (Sept. ακχους), with which has been compared Ikausu, a king of Ekron (7th century) and the "Keftian" name *Akashau* of the XIXth Egyptian dynasty. Names in *-ath* (Goliath; Ahuzzath, Gen. xxvi.) are not restricted to Philistines, and Phicol (ibid.) is too obscure to serve as evidence. The religion is not novel. The male god Dagon has his partner Astarte (*qq.v.*), and Baal-zebub, a famous oracle of Ekron (2 Kings i.) finds a parallel in the local "baals" of Palestine.[1] Even when the region seems to be completely Hellenized after the Persian age, it is not so certain that Greek culture pervaded all classes (see G. F. Moore, *Ency. Bib.* col. 3726), although a certain amount of foreign influence probably made itself felt upon the coast-towns at all times. The use of the term ἀλλόφυλοι in Maccabaean and later writings (cf. the contemptuous hatred of Ben Sira, Ecclesiasticus l. 26, and the author of Jubilees xxiv. 30 sqq.) correctly expresses the conditions of the Greek age and the Maccabaean wars, and naturally any allusion to the situations of many centuries previously is quite unnecessary. Similarly, the biblical evidence represents the traditions in the form which they had reached in the writer's time, the true date of which is often uncertain. Antagonism between Philistines and Israelites was not a persisting feature, and, although the former are styled "uncircumcised" (chiefly in the stories in the book of Samuel), the term gained new force when the expulsion of uncircumcised aliens from the sanctuary of Jerusalem was proclaimed in the writings ascribed to Ezekiel (ch. xliv.).[2]

In fact the question arises whether the history of the Philistines is not that of a territorial designation, rather than that of the lineal descendants of the Purasati, who, if one of the peoples who took part in the events of the XXth Dynasty, may well have bequeathed their name. The Mediterranean coast-land was always exposed to incursions of aliens, and when Carians appear as royal and temple guards at Jerusalem (2 Kings xi. 4), it is sufficient to recall old Greek traditions of a Carian sea-power and relations between Philistia and Greek lands.[3] Even the presence of Carians and Ionians in the time of Psammetichus I. may be assumed, and when these are planted at Defneh it is noteworthy that this is also closely associated with a Jewish colony (viz. Tahpanhes, Jer. xliii. seq.). Although the Purasati appear after the 15th–14th centuries, now illuminated by the Amarna tablets, their own history is perhaps earlier.[4] But there is no reason at present to believe that their entrance caused any break in the archaeological history. The apparently "Aegean" influence which enters into the general "Amarna" period seems to begin before the age of the Amarna tablets (at Lachish), and it passes gradually into later phases contemporary with the Israelite monarchy. There is a fairly continuous intercourse with external culture (Cypriote, early and late Greek), and, if Gath be identified with Tel eṣ-Ṣâfi, Bliss and Macalister, who excavated it, found no trace of any interruption in its history. Only at Gezer—perhaps Philistine, 2 Sam. v. 25—has there been found evidence for a strange race with several distinctive features. Bricked vault tombs were discovered containing bodies outstretched (not contracted); the deposits were of an unusually fine character and comprised silver, alabaster and even iron. The culture appears to find Carian and Lydian parallels, and has been ascribed provisionally to the 13th–10th centuries. So far, however, of the cities lying within or immediately exposed to Philistine influence, the discoveries at Gezer are unique.[5]

According to the biblical traditions the Philistines are the remnant of Caphtor (Jer. xlvii. 4, Amos ix. 7), and the Caphtōrīm drove out the aboriginal Avva from Gaza and district, as the Horites and Rephaim were displaced by Edom and Ammon (Deut. ii. 23). These Caphtōrīm, together with Ludim (Lydians) and other petty peoples, apparently of the Delta, are once reckoned to Egypt (Gen. x. 14).[6] By Caphtor the Septuagint has sometimes understood Cappadocia, which indeed may be valid for its age, but the name is to be identified with the Egyptian K(a)ptar, which in later Ptolemaic times seems to mean Phoenicia, although *Keftiu* had had another connotation. The Cherethites, associated with the Philistine district (1 Sam. xxx. 14, 16, Ezek. xxv. 16, Zeph. ii. 5 seq.), are sometimes recognized by the Septuagint as Cretans, and, with the Pelethites (often taken to be a rhyming form of Philistines), they form part of the royal body-guard of Judaean kings (2 Sam. viii. 18, xv. 18. xx. 7, 1 Kings i. 38, 44; in 2 Sam. xx. 23 the Hebrew text has Carites). However adequate these identifications may seem, the persistence of an independent clan or tribe of Cherethites-Cretans to the close of the 7th century would imply an unbroken chain of nearly six hundred years, unless, as is inherently more probable, later immigrations had occurred within the interval. But upon the ethnological relations either of the south Palestinian coast or of the Delta it would be unsafe to dogmatize. So far as can be ascertained, then, the first mention of the Philistines belongs to an age of disturbance and change in connexion with movements in Asia Minor. Archaeological evidence for their influence has indeed been adduced,[7] but it is certain that some account must be taken also of the influence by land from North Syria and Asia Minor. The influences, whether from the Levant or from the north, were not confined to the age of Rameses III. alone, and the biblical evidence, especially, while possibly preserving some recollection of the invasion of the Purasati, is in every case late and may be shaped by later historical vicissitudes. It is impossible that Palestine should have remained untouched by the external movements in connexion with the Delta, the Levant and Asia Minor, and it is possible that the course of internal history in the age immediately before and after 1000 B.C. ran upon lines different from the detailed popular religious traditions which the biblical historians have employed. (See further PALESTINE: *History*.)

For older studies, see F. Hitzig, *Urgeschichte der Philister* (1845), with the theory of the Pelasgic origin of the Philistines; K. Stark, *Gaza u. d. philist. Küste* (1852), and (with special reference to earlier theories) W. Robertson Smith's art. in *Ency. Brit.*, 9th ed.

(S. A. C.)

PHILISTUS, Greek historian of Sicily, was born at Syracuse about the beginning of the Peloponnesian War (432 B.C.). He was a faithful supporter of the elder Dionysius, and commander

[1] See further, F. Schwally, *Zeit. wissens. Theol.* xxxiv. 103–108. A few Hebrew words have been regarded as Philistine loan-words, so notably *pillégesh*, "concubine" (παλλακή, παλλακίς, Lat. *pellex*), and *seren* (τύραννος), the title applied to the five lords of the Philistine confederation; *seren* otherwise means "axle," and may have been applied metaphorically like the Arab. *ḳotb* (W. R. Smith). On the other hand, a common origin in Asia Minor is also possible for these words.

[2] In the prophetical writings the Philistines are denounced (with Ammon, Moab and Edom) for their vengeance upon Judah (Ezek. xxv. 15–17). With Tyre and Sidon they are condemned for plundering Judah, and for kidnapping its children to sell to the Greeks (Joel iii. 4–8; cf. Amos i. 6–12; 1 Macc. iii. 41). They are threatened with a foe from the north (Jer. xxv. 20; Isa. xiv. 29–31; see ZEPHANIAH), as also is Phoenicia (Jer. xlvii. 2–7) upon whom they depend (cf. Zech. ix. 3–8). Judah is promised reprisals (Zeph. ii. 7; Obad. 19), and a remnant of the Philistines may become worshippers of Yahweh (Zech. ix. 7). The historical backgrounds of these passages are disputed.

of the citadel. In 386 he excited the jealousy of the tyrant by secretly marrying his niece, and was sent into banishment. He settled at Thurii, but afterwards removed to Adria, where he remained until the death of Dionysius (366). He was then recalled by the younger Dionysius, whom he persuaded to dismiss Plato and Dion. When Dion set sail from Zacynthus with the object of liberating Syracuse from the *tyrannis*, Philistus was entrusted with the command of the fleet, but he was defeated and put to death (356). During his stay at Adria, Philistus occupied himself with the composition of his Σικελικά, a history of Sicily in eleven books. The first part (bks. i.–vii.) comprised the history of the island from the earliest times to the capture of Agrigentum by the Carthaginians (406); the second, the history of the elder and the younger Dionysius (down to 363). From this point the work was carried on by Philistus's fellow countryman Athanas. Cicero (*ad. Q. Fr.* ii. 13), who had a high opinion of his work, calls him the "miniature Thucydides" (*pusillus Thucydides*). He was admitted by the Alexandrian critics into the canon of historiographers, and his work was highly valued by Alexander the Great.

PHILLAUR, a town of British India, in Jullundur district, Punjab, on the north bank of the river Sutlej, 8 m. N. of Ludhiana. Pop. (1901), 6986. Founded by the Mogul emperor Shah Jahan, it was long of importance as commanding the crossing of the Sutlej. At the Mutiny in 1857 the fort contained the siege train, which was sent safely to Delhi; but the sepoy regiment in the cantonment shortly afterwards mutinied and escaped. The fort is now occupied by the police training school and the central bureau of the criminal identification department.

PHILLIMORE, SIR ROBERT JOSEPH (1810–1885), English judge, third son of a well-known ecclesiastical lawyer, Dr Joseph Phillimore, was born at Whitehall on the 5th of November 1810. Educated at Westminster and Christ Church, Oxford, where a life-long friendship with W. E. Gladstone began, his first appointment was to a clerkship in the board of control, where he remained from 1832 to 1835. Admitted as an advocate at Doctors' Commons in 1839, he was called to the bar at the Middle Temple in 1841, and rose very rapidly in his profession. He was engaged as counsel in almost every case of importance that came before the admiralty, probate or divorce courts, and became successively master of faculties, commissary of the deans and chapters of St Paul's and Westminster, official of the archdeaconries of Middlesex and London, and chancellor of the dioceses of Chichester and Salisbury. In 1853 he entered parliament as member for Tavistock. A moderate in politics, his energies were devoted to non-party measures, and in 1854 he introduced the bill for allowing viva voce evidence in the ecclesiastical courts. He sat for Tavistock until 1857, when he offered himself as a candidate for Coventry, but was defeated. He was appointed judge of the Cinque Ports in 1855, Queen's Counsel in 1858, and advocate-general in admiralty in 1862, and succeeded Dr Stephen Lushington (1782–1873) as judge of the court of arches five years later. Here his care, patience and courtesy, combined with unusual lucidity of expression, won general respect. In 1875, in accordance with the Public Worship Regulation Act, he resigned, and was succeeded by Lord Penzance. When the Judicature Act came into force the powers of the admiralty court were transferred to the High Court of Justice, and Sir Robert Phillimore was therefore the last judge of the historic court of the lord high admiral of England. He continued to sit as judge for the new admiralty, probate and divorce division until 1883, when he resigned. He wrote *Ecclesiastical Law of the Church of England*, a book which still holds its ground, *Commentaries on International Law*, and a translation of Lessing's *Laocoon*. He married, in 1844, Charlotte Anne, daughter of John Denison of Ossington Hall, Newark. He was knighted in 1862, and created a baronet in 1881. He died at Shiplake, near Henley-on-Thames, on the 4th of February 1885. His eldest son, Sir Walter G. F. Phillimore (b. 1845), also distinguished as an authority on ecclesiastical and admiralty law, became in 1897 a judge of the high court.

PHILLIP, JOHN (1817–1867), Scottish painter, was born at Aberdeen, Scotland, on the 19th of April 1817. His father, an old soldier, was in humble circumstances, and the son became an errand-boy to a tinsmith, and was then apprenticed to a painter and glazier. Having received some technical instruction from a local artist named William Mercer, he began, at the age of about fifteen, to paint portraits. In 1834 he made a very brief visit to London. About this time he became assistant to James Forbes, an Aberdeen portrait-painter. He had already gained a valuable patron. Having been sent to repair a window in the house of Major P. L. Gordon, his interest in the works of art in the house attracted the attention of their owner. Gordon brought the young artist under the notice of Lord Panmure, who in 1836 sent him to London, promising to bear the cost of his art education. At first Phillip was placed under T. M. Joy, but he soon entered the schools of the Royal Academy. In 1839 he figured for the first time in the royal academy exhibition with a portrait and a landscape, and in the following year he was represented by a more ambitious figure-picture of "Tasso in Disguise relating his Persecutions to his Sister." For the next ten years he supported himself mainly by portraiture and by painting subjects of national incident, such as "Presbyterian Catechizing," "Baptism in Scotland," and the "Spaewife." His productions at this period, as well as his earlier subject-pictures, are reminiscent of the practice and methods of Wilkie and the Scottish genre-painters of his time. In 1851 his health showed signs of delicacy, and he went to Spain in search of a warmer climate. He was brought face to face for the first time with the brilliant sunshine and the splendid colour of the south, and it was in coping with these that he first manifested his artistic individuality and finally displayed his full powers. In the "Letter-writer of Seville" (1854), commissioned by Queen Victoria at the suggestion of Sir Edwin Landseer, the artist is struggling with new difficulties in the portrayal of unwonted splendours of colour and light. In 1857 Phillip was elected an associate of the Royal Academy, and in 1859 a full member. In 1855 and in 1860 further visits to Spain were made, and in each case the painter returned with fresh materials to be embodied with increasing power and subtlety in the long series of works which won for him the title of "Spanish Phillip." His highest point of execution is probably reached in "La Gloria" (1864) and a smaller single-figure painting of the same period entitled "El Cigarillo." These Spanish subjects were varied in 1860 by a rendering of the marriage of the princess royal with the crown prince of Prussia, executed by command of the queen, and in 1863 by a picture of the House of Commons. During his last visit to Spain Phillip occupied himself in a careful study of the art of Velazquez, and the copies which he made fetched large prices after his death, examples having been secured by the royal and the royal Scottish academies. The year before his death he visited Italy and devoted attention to the works of Titian. The results of this study of the old masters are visible in such works as "La Loteria Nacional," left uncompleted at his death. During this period he resided much in the Highlands, and seemed to be returning to his first love for Scottish subjects, painting several national scenes, and planning others that were never completed. He died in London on the 27th of February 1867.

His works were collected in the International Exhibition of 1873, and many of them are engraved by T. Oldham Barlow. In addition to the paintings already specified the following are among the more important: "Life among the Gipsies of Seville" (1853), "El Paseo" (1855), "Collection of the Offertory in a Scotch Kirk" (1855), "A Gipsy Water-carrier in Seville" (1855), "The Prayer of Faith shall save the Sick" (1856), "The Dying Contrabandist" (1856), "The Prison Window" (1857), "A Huff" (1859), "Early Career of Murillo" (1865), "A Chat round the Brasero" (1866).

PHILLIPS, ADELAIDE (1833–1882), American contralto singer, was born at Stratford-on-Avon, England, her family emigrating to America in 1840. Her mother taught dancing,

and Adelaide began a career on the Boston stage at ten years old. But in 1850 her talent for singing became evident, and through Jenny Lind and others she was sent to London and to Italy to study. In 1855 she returned to America an accomplished vocalist; and for many years she was the leading America contralto, equally successful in oratorio and on the concert platform. She died at Carlsbad on the 3rd of October 1882.

PHILLIPS, EDWARD (1630–1696), English author, son of Edward Phillips of the crown office in chancery, and his wife Anne, only sister of John Milton, the poet, was born in August 1630 in the Strand, London. His father died in 1631, and Anne Phillips eventually married her husband's successor in the crown office, Thomas Agar. Edward Phillips and his younger brother, John, were educated by Milton. Edward entered Magdalen Hall, Oxford, in November 1650, but left the university in 1651 to be a bookseller's clerk in London. Although he entirely differed from Milton in his religious and political views, and seems, to judge from the free character of his *Mysteries of Love and Eloquence* (1658), to have undergone a certain revulsion from his Puritan upbringing, he remained on affectionate terms with his uncle to the end. He was tutor to the son of John Evelyn, the diarist, from 1663 to 1672 at Sayes Court, near Deptford, and in 1677–1679 in the family of Henry Bennet, earl of Arlington. The date of his death is unknown, but his last book is dated 1696.

His most important work is *Theatrum poetarum* (1675), a list of the chief poets of all ages and countries, but principally of the English poets, with short critical notes and a prefatory *Discourse of the Poets and Poetry*, which has usually been traced to Milton's hand. He also wrote *A New World in Words, or a General Dictionary* (1658), which went through many editions; a new edition of Baker's *Chronicle*, of which the section on the period from 1650 to 1658 was written by himself from the royalist standpoint; a supplement (1676) to John Speed's *Theatre of Great Britain*; and in 1684 *Enchiridion linguae latinae*, said to have been taken chiefly from notes prepared by Milton. Aubrey states that all Milton's papers came into Phillips's hands, and in 1694 he published a translation of his *Letters of State* with a valuable memoir.

His brother, JOHN PHILLIPS (1631–1706), in 1652 published a Latin reply to the anonymous attack on Milton entitled *Pro Rege et populo anglicano*. He appears to have acted as unofficial secretary to Milton, but, disappointed of regular political employment, and chafing against the discipline he was under, he published in 1655 a bitter attack on Puritanism entitled a *Satyr against Hypocrites* (1655). In 1656 he was summoned before the privy council for his share in a book of licentious poems, *Sportive Wit*, which was suppressed by the authorities but almost immediately replaced by a similar collection, *Wit and Drollery*. In *Montelion* (1660) he ridiculed the astrological almanacs of William Lilly. Two other skits of this name, in 1661 and 1662, also full of coarse royalist wit, were probably by another hand. In 1678 he supported the agitation of Titus Oates, writing on his behalf, says Wood, "many lies and villanies." *Dr Oates's Narrative of the Popish Plot indicated* was the first of these tracts. He began a monthly historical review in 1688 entitled *Modern History or a Monthly Account of all considerable Occurrences, Civil, Ecclesiastical and Military*, followed in 1690 by *The Present State of Europe, or a Historical and Political Mercury*, which was supplemented by a preliminary volume giving a history of events from 1688. He executed many translations from the French, and a version (1687) of *Don Quixote*.

An extended, but by no means friendly, account of the brothers is given by Wood, *Athen. oxon.* (ed. Bliss, iv. 764 seq.), where a long list of their works is dealt with. This formed the basis of William Godwin's *Lives of Edward and John Phillips* (1815), with which is reprinted Edward Phillips's *Life of John Milton*.

PHILLIPS, JOHN (1800–1874), English geologist, was born on the 25th of December 1800 at Marden in Wiltshire. His father belonged to an old Welsh family, but settled in England as an officer of excise and married the sister of William Smith, the "Father of English Geology." Both parents dying when he was a child, Phillips came under the charge of his uncle; and after being educated at various schools, he accompanied Smith on his wanderings in connexion with his geological maps. In the spring of 1824 Smith went to York to deliver a course of lectures on geology, and his nephew accompanied him. Phillips accepted engagements in the principal Yorkshire towns to arrange their museums and give courses of lectures on the collections contained therein. York became his residence, where he obtained, in 1825, the situation of keeper of the Yorkshire museum and secretary of the Yorkshire Philosophical Society. From that centre he extended his operations to towns beyond the county; and in 1831 he included University College, London, in the sphere of his activity. In that year the British Association for the Advancement of Science was founded at York, and Phillips was one of the active minds who organized its machinery. He became in 1832 the first assistant secretary, a post which he held until 1859. In 1834 he accepted the professorship of geology at King's College, London, but retained his post at York. In 1834 he was elected F.R.S.; in later years he received hon. degrees of LL.D. from Dublin and Cambridge, and D.C.L. from Oxford; while in 1845 he was awarded the Wollaston Medal by the Geological Society of London. In 1840 he resigned his charge of the York museum and was appointed on the staff of the geological survey of Great Britain under De la Beche. He spent some time in studying the Palaeozoic fossils of Devon, Cornwall and West Somerset, of which he published a descriptive memoir (1841); and he made a detailed survey of the region of the Malvern Hills, of which he prepared the elaborate account that appears in vol. ii. of the *Memoirs of the Survey* (1848). In 1844 he became professor of geology in the university of Dublin. Nine years later, on the death of H. E. Strickland, who had acted as substitute for Dean Buckland in the readership of geology in the university of Oxford, Phillips succeeded to the post of deputy, and at the dean's death in 1856 became himself reader, a post which he held to the time of his death. During his residence in Oxford he took a leading part in the foundation and arrangement of the new museum erected in 1859 (see his *Notices of Rocks and Fossils in the University Museum*, 1863; and *The Oxford Museum*, by H. W. Acland and J. Ruskin, 1859; reprinted with additions, 1893). Phillips was also keeper of the Ashmolean museum from 1854–1870. In 1859–1860 he was president of the Geological Society of London, and in 1865 president of the British Association. He dined at All Souls College on the 23rd of April 1874, but on leaving he slipped and fell down a flight of stone stairs, and died on the following day.

From the time he wrote his first paper "On the Direction of the Diluvial Currents in Yorkshire" (1827), down to the last days of his life, Phillips continued a constant contributor to the literature of science. The pages of the *Philosophical Magazine*, the *Journal of the Geological Society*, the *Geological Magazine* and other publications contain valuable essays by him. He was also the author of numerous separate works, which were of great benefit in extending a sound knowledge of geology. Among these may be specially mentioned: *Illustrations of the Geology of Yorkshire* (in two parts, 1829 and 1836; 2nd ed. of pt. 1 in 1835, 3rd ed., edited by R. Etheridge, in 1875); *A Treatise on Geology* (1837–1839); *Memoirs of William Smith* (1844); *The Rivers, Mountains and Sea-Coast of Yorkshire* (1853); *Manual of Geology, Practical and Theoretical* (1855); *Life on the Earth: its Origin and Succession* (1860); *Vesuvius* (1869); *Geology of Oxford and the Valley of the Thames* (1871). To these should be added his *Monograph of British Belemnitidae* (1865), for the Palaeontographical Society, and his geological map of the British Isles (1847).

See Biographical Memoir, with portrait, in *Geol. Mag.* (July 1870).

PHILLIPS, SAMUEL (1814–1854), English journalist, the son of a Jewish tradesman in London, was born on the 28th of December 1814. He was educated at University College, London, and then at Göttingen. Having renounced the Jewish faith, he returned to England and entered Sidney Sussex College, Cambridge, with the design of taking orders. His father's death, however, prevented this, and in 1841 he took to literary work. He wrote a novel, *Caleb Stukely* (1862), and other tales, and about 1845 began a connexion with *The Times* as literary critic. In the following year he purchased the *John Bull* newspaper, and edited it for a year. Two volumes of his *Essays from The Times* appeared in 1852 and 1854. Phillips took an active part in the formation of the Crystal Palace Company, and wrote their descriptive guides. In 1852 the university of Göttingen

conferred upon him the honorary degree of LL.D. He died at Brighton on the 14th of October 1854.

PHILLIPS, STEPHEN (1868–), British poet and dramatist, was born on the 28th of July 1868 at Somertown near Oxford, the son of the Rev. Stephen Phillips, precentor of Peterborough Cathedral. He was educated at Stratford and Peterborough Grammar Schools, and entered Queen's College, Cambridge; but during his first term at Cambridge, when F. R. Benson's dramatic company visited the town, he joined it, and for six years played various small parts. In 1890 a slender volume of verse was published at Oxford with the title *Primavera*, which contained contributions by him and by his cousin Laurence Binyon and others. In 1894 he published *Eremus*, a long poem of loose structure in blank verse of a philosophical complexion. In 1896 appeared *Christ in Hades*, forming with a few other short pieces one of the slim paper-covered volumes of Elkin Mathews's "Shilling Garland." This poem arrested the attention of watchful critics of poetry, and when it was followed by a collection of *Poems* in 1897 the writer's position as a new poet of exceptional gifts was generally recognized. This volume contained a new edition of "Christ in Hades," together with "Marpessa," "The Woman with the Dead Soul," "The Wife" and shorter pieces, including the fine lines "To Milton, Blind." The volume won the prize of £100 offered by the *Academy* newspaper for the best new book of its year, ran through half a dozen editions in two years, and established Mr Phillips's rank as poet, which was sustained by the publication in the *Nineteenth Century* in 1898 of his poem "Endymion." George Alexander, the actor-manager, moved perhaps by a certain clamour among the critics for a literary drama, then commissioned Mr Phillips to write him a play, the result being *Paolo and Francesca* (1900), a drama founded on Dante's famous episode. Encouraged by the great success of the drama in its literary form, Mr Alexander produced the piece at the St James's Theatre in the course of 1901. In the meantime, Mr Phillips's next play, *Herod: a Tragedy*, had been produced by Beerbohm Tree on the 31st of October 1900, and was published as a book in 1901; *Ulysses*, also produced by Beerbohm Tree, was published in 1902; *The Sin of David*, a drama on the story of David and Bathsheba, translated into the times and terms of Cromwellian England, was published in 1904; and *Nero*, produced by Beerbohm Tree, was published in 1906. In these plays the poet's avowed aim was, instead of attempting to revive the method of Shakespeare and the Elizabethans, to revitalize the method of Greek drama. *Paolo and Francesca* (which admitted certainly one scene on an Elizabethan model) was the most successful, the subject being best adapted to the lyrical cast of Mr Phillips's poetical temperament; but all contained fine poetry, skilfully stage-managed by a writer who had practical experience of stage craft.

See the section on Stephen Phillips in *Poets of the Younger Generation*, by William Archer (1902); also the articles on "Tragedy and Mr Stephen Phillips," by William Watson, in the *Fortnightly Review* (March 1898); "The Poetry of Mr Stephen Phillips," in the *Edinburgh Review* (January 1900); "Mr Stephen Phillips," in the *Century* (January 1901), by Edmund Gosse; and "Mr Stephen Phillips," in the *Quarterly Review* (April 1902), by Arthur Symons.
For bibliography up to July 1903, see *English Illustrated Magazine*, new series, vol. xxix. p. 442.

PHILLIPS, THOMAS (1770–1845), English portrait and subject painter, was born at Dudley in Warwickshire on the 18th of October 1770. Having acquired the art of glass-painting at Birmingham he visited London in 1790 with an introduction to Benjamin West, who found him employment on the windows in St George's Chapel at Windsor. In 1792 Phillips painted a view of Windsor Castle, and in the next two years he exhibited the "Death of Talbot, Earl of Shrewsbury, at the Battle of Castillon," "Ruth and Naomi," "Elijah restoring the Widow's Son," "Cupid disarmed by Euphrosyne," and other pictures. After 1796, however, he mainly confined himself to portrait-painting. It was not long before he became the chosen painter of men of genius and talent, notwithstanding the rivalry of Hoppner, Owen, Jackson and Lawrence; and he left behind portraits of nearly all the illustrious characters of his day. In 1804 he was elected associate and in 1808 member of the Royal Academy. In 1824 Phillips succeeded Fuseli as professor of painting to the Royal Academy, an office which he held till 1832. During this period he delivered ten *Lectures on the History and Principles of Painting*, which were published in 1833. He died on the 20th of April 1845.

PHILLIPS, WENDELL (1811–1884), American orator and reformer, was born in Boston on the 29th of November 1811. His father, John Phillips (1770–1823), a man of wealth and influence, graduated at Harvard College in 1788, and became successively "town advocate and public prosecutor," and in 1822 first mayor of Boston, then recently made into a city. Wendell Phillips himself attended the public Latin school, entered Harvard College before he was sixteen, and graduated in 1831 in the same class with the historian John Lothrop Motley. He graduated at the Harvard law school in 1834, and was admitted to the bar in Boston. He soon came under the influence of the anti-slavery movement, witnessing in 1835 the mobbing, in Boston, of William Lloyd Garrison. On the 8th of December 1837 a meeting was held at Faneuil Hall to express the sentiments of the people on the murder of Elijah P. Lovejoy, at Alton, Illinois, for defending his press from a pro-slavery mob. In the course of the meeting a speech was made in opposition to its general current by James T. Austin (1784–1870), attorney-general of the state, who said that Lovejoy had died "as the fool dieth," and compared his murderers to the men who threw the tea into Boston harbour just before the War of Independence. The speech seemed likely to divide the audience, when Wendell Phillips took the platform. "When I heard," he said, "the gentleman lay down principles which placed the murderers of Alton side by side with Otis and Hancock, with Quincy and Adams, I thought these pictured lips (pointing to their portraits) would have broken into voice to rebuke the recreant American, the slanderer of the dead." This appeal not merely determined the sentiment of the meeting, it gave Wendell Phillips his first fame and determined his career. Although loving his profession, and this especially for the opening it gave in the direction of public life, he practically stepped outside the sphere dearest to young Americans, and lived henceforth the life of an agitator, or, like his father, that of a "public prosecutor." Accepting unhesitatingly the leadership of Garrison, and becoming like him gradually a disunionist, he lived essentially a platform life, interested in a variety of subjects, but first and chiefly an abolitionist. In 1865, however, after the Civil War, he broke with Garrison over the question of discontinuing the Anti-Slavery Society, and from that date until the society was disbanded in 1870 he, instead of Garrison, was its president. He was not, moreover, like his great leader, a non-resistant, nor was he, on the other hand, like John Brown, borne on by irresistible necessity to overt action. Nor did he find, like his fellow-worker, Theodore Parker, the leisure to keep up his scholarship and lead in part the life of a student. Early study and travel had indeed furnished him with abundant material for rhetorical illustration; and he was also a great reader of newspapers, but he used to say that he knew in his whole life but one thing thoroughly, namely, the history of the English Civil War, and there were few occasions when he could not draw from it the needful illustration. His style of eloquence was direct and brilliant, but eminently self-controlled. He often surprised his hearers by the quietness of his beginnings, and these were very often the speeches which turned out most brilliant and most irresistible ere the close. He may be said to have introduced the direct and colloquial manner upon the American public platform, as distinct from the highly elaborated and often ornate style which had been established by Edward Everett; nor has there ever been a reversion since his day to the more artificial method. He was capable at times, nevertheless, of highly sonorous periods with superb climaxes; yet his favourite style was the conversational. His logic, while never obtruded, was rarely at fault; but he loved the flash of the rapier, and

was never happier than when he had to face down a mob and utterly foil it by sheer superiority in fencing. The two volumes of his speeches, as edited by James Redpath, were fortunately made from verbatim reports, and they wisely enclose in parentheses those indications of favour or dissent from the audience which transformed so many of his speeches into exhibitions of gladiatorial skill. He was a tribune of the people, associated unflinchingly not merely with the unpopular but with the unpolished; always carrying about him not merely a certain Roman look, but a patrician air. After slavery had fallen Phillips associated himself freely with reformers occupied in other paths, herein separating himself from the other patrician of the movement, Edmund Quincy, who always frankly said that after slavery was abolished there was nothing else worth fighting for. Among other things, Phillips contended, during his later years, for prohibition, woman suffrage and various penal and administrative reforms. He was not always the best judge of character, and was sometimes allied in these movements with men who were little more than demagogues. But the proof he gave by his transfer of energies that the work of reform was never quite finished—this was something of peculiar value, and worth the risk of some indiscretions. The life of a reformer did not in itself make him thoroughly happy; he chafed more and more under its fatigues, and he always felt that his natural place would have been among senators or ambassadors; but he belonged essentially to the heroic type, and it may well have been of him that Emerson was thinking when he wrote those fine words: "What forests of laurel we bring and the tears of mankind to him who stands firm against the opinion of his contemporaries." His domestic life was most happy, though his wife was a confirmed invalid, seldom quitting her room. She was a woman of heroic nature and very strong convictions. Her husband used to say that she first made him an abolitionist. They had no children, but adopted an orphaned daughter of Mrs Eliza Garnaut, a friend, and this young girl (afterwards the wife of George W. Smalley), brought much light and joy into the household. Their worldly circumstances were easy, though they were always ready to impoverish themselves for the sake of others. Wendell Phillips died in Boston on the 2nd of February 1884.

PHILLIPS, WILLIAM (1775–1828), British mineralogist and geologist, son of James Phillips, printer and bookseller in London, was born on the 10th of May 1775. He early became interested in mineralogy and geology, and was one of the founders of the Geological Society of London (1807). His *Outlines of Mineralogy and Geology* (1815) and *Elementary Introduction to the Knowledge of Mineralogy* (1816) became standard textbooks. His digest of English geology, *A selection of Facts from the Best Authorities, arranged so as to form an Outline of the Geology of England and Wales* (1818), formed the foundation of the larger work undertaken by Phillips in conjunction with W. D. Conybeare, of which only the first part was published, entitled *Outlines of the Geology of England and Wales* (1822). This volume made an era in geology. As a model of careful original observation, of judicious compilation, of succinct description, and of luminous arrangement it has been of the utmost service in the development of geology in Britain. In this work Phillips reprinted his admirable description of the chalk cliffs of Dover and other parts of East Kent, published in 1819 in *Trans. Geol. Soc.* vol. v. Phillips was a member of the Society of Friends. He was elected a Fellow of the Royal Society in 1827. He died on the 2nd of April 1828.

His brother, Richard Phillips (1778–1851), was distinguished as a chemist, and became F.R.S. in 1822. He was appointed chemist and curator to the Museum of Economic (afterwards Practical) Geology, then situated in Craig's Court (1839). He was the author of papers published in the *Annals of Philosophy* and *Philosophical Magazine*. In 1796 the two brothers, together with William Allen and Luke Howard, took part in forming the Askesian Society.

PHILLIPSBURG, a town of Warren county, New Jersey, U.S.A., on the Delaware river, opposite Easton, Pennsylvania, and about 51 m. N.N.W. of Trenton, N.J. Pop. (1900), 10,052, of whom 990 were foreign-born; (1906 estimate), 13,712. Served by the Central of New Jersey and other railways, the town is situated in the river bottom and on a bluff which commands beautiful views. The river is spanned here by several bridges. The town has railway shops and various manufactures. In 1905 the value of the factory products was $6,684,173 (45·8% more than in 1900). Phillipsburg was settled about 1750. It was only a straggling village when the Morris Banking and Canal Company was chartered in 1824, but its growth was accelerated by the canal (no longer used), by the establishment in 1848 of an iron furnace, and by the completion of the Central Railroad of New Jersey to this point in 1852; the town was incorporated in 1861.

PHILLIPSITE, a mineral of the zeolite group; a hydrated potassium, calcium and aluminium silicate, approximating to $(K_2, Ca)Al_2(SiO_3)_4 \cdot 4H_2O$. It varies somewhat in composition, and a variety ("pseudophillipsite") containing rather less silica has the formula $(K_2, Ca)_2Al_4Si_6O_{18} \cdot 9H_2O$. Crystals are monoclinic, but only complex cruciform twins are known, these being exactly like twins of harmotome (*q.v.*). Crystals of phillipsite are, however, usually smaller and more transparent and glassy than those of harmotome. Spherical groups with a radially fibrous structure and bristled with crystals on the surface are not uncommon. The hardness is 4½, and the specific gravity 2·2. The species was established by A. Lévy in 1825 and named after William Phillips. French authors use the name christianite (after Christian VIII. of Denmark), given by A. Des Cloizeaux in 1847.

Phillipsite is a mineral of secondary origin, and occurs with other zeolites in the amygdaloidal cavities of basic volcanic rocks: *e.g.* in the basalt of the Giant's Causeway in County Antrim, and near Melbourne in Victoria; and in leucitite near Rome. Small crystals of recent formation have been observed in the masonry of the hot baths at Plombières and Bourbonne-les-Bains, in France. Minute spherical aggregates embedded in red clay were dredged by the "Challenger" from the bottom of the Central Pacific, where they had been formed by the decomposition of lava. (L. J. S.)

PHILLPOTTS, HENRY (1778–1869), English bishop, was born at Bridgwater on the 6th of May 1778, and was educated at Gloucester College school and at Corpus Christi College, Oxford. He became a fellow of Magdalen College, Oxford, in 1795, took orders in 1802, and was select university preacher in 1804. In 1805 he received the living of Stainton-le-Street, Durham, and in addition was appointed to Bishop Middleham, Durham, in the succeeding year. For twenty years he was chaplain to Shute Barrington, bishop of Durham. He was appointed vicar of Gateshead in 1808, prebendary of Durham in 1809, and vicar of St Margaret, Durham, in 1810. After holding the rich living of Stanhope, Durham from 1820, and the deanery of Chester from 1828, he was consecrated bishop of Exeter in 1831, holding with the see a residentiary canonry at Durham. His published works include numerous speeches and pamphlets, including those connected with his well-known Roman Catholic controversy with Charles Butler (1750–1832). He was an energetic supporter of the Tory party, even when it acted contrary to his views in passing the Roman Catholic Emancipation Act of 1829. He died on the 18th of September 1869. "Henry of Exeter," as he was commonly called, was one of the most striking figures in the English Church of the 18th century. His intellect was strong rather than broad, his position being that of the traditional High Churchman, with little sympathy either with the Evangelicals or with the Tractarians. On the one hand the famous Gorham judgment was the outcome of his refusal to institute to the living of Brampford Speke a clergyman George Cornelius Gorham (1787–1857), who had openly disavowed his belief in baptismal regeneration; on the other he denounced the equally famous Tract XC. in his episcopal charge of 1843. As bishop he was a strict disciplinarian, and

did much to restore order in a diocese of which the clergy had become extraordinarily demoralized. Though accused of avarice and pluralism, Phillpotts was generous in his gifts to the church, founding the theological college at Exeter and spending large sums on the restoration of the cathedral.

PHILO, Jewish Hellenist, and author of an epic poem in Greek hexameters on the history of Jerusalem. Alexander Polyhistor (*c.* 105–35 B.C.) quotes several passages of the poem, and is the source of the extracts in Eusebius (*Praeparatio evangelica*, ix. 20, 24, 37). This is probably the Philo who is mentioned by Clemens Alexandrinus (*Strom.* i. 21, 141) and by Josephus (*Contra Apionem*, i. 23), who calls him "the elder."

See M. Philippson's work on the Jewish poets Ezechiel and Philo (Berlin, 1830).

PHILO, often called PHILO JUDAEUS, Jewish philosopher, appears to have spent his whole life at Alexandria, where he was probably born *c.* 20–10 B.C. His brother Alexander was alabarch or arabarch (that is, probably, chief farmer of taxes on the Arabic side of the Nile), from which it may be concluded that the family was influential and wealthy (Jos. *Ant.* xviii. 8, 1). Jerome's statement (*De vir. ill.* 11) that he was of priestly race is confirmed by no older authority. The only event of his life which can be actually dated belongs to A.D. 40, when Philo, then a man of advanced years, went from Alexandria to Rome, at the head of a Jewish embassy, to persuade the emperor Gaius to abstain from claiming divine honour of the Jews. Of this embassy Philo has left a full and vivid account (*De legatione ad Gaium*). Various fathers and theologians of the Church state that in the time of Claudius he met St Peter in Rome;[1] but this legend has no historic value, and probably arose because the book *De vita contemplativa*, ascribed to Philo, in which Eusebius already recognized a glorification of Christian monasticism, seemed to indicate a disposition towards Christianity.

Though we know so little of Philo's own life, his numerous extant writings give the fullest information as to his views of the universe and of life, and his religious and scientific aims, and so enable us adequately to estimate his position and importance in the history of thought. He is quite the most important representative of Hellenistic Judaism, and his writings give us the clearest view of what this development of Judaism was and aimed at. The development of Judaism in the diaspora (*q.v.*) differed in important points from that in Palestine, where, since the successful opposition of the Maccabee age to the Hellenization which Antiochus Epiphanes had sought to carry through by force, the attitude of the nation to Greek culture had been essentially negative. In the diaspora, on the other hand, the Jews had been deeply influenced by the Greeks; they soon more or less forgot their Semitic mother-tongue, and with the language of Hellas they appropriated much of Hellenic culture. They were deeply impressed by that irresistible force which was blending all races and nations into one great cosmopolitan unity, and so the Jews too on their dispersion became in speech and nationality Greeks, or rather "Hellenists." Now the distinguishing character of Hellenism is not the absolute disappearance of the Oriental civilizations before that of Greece but the combination of the two with a preponderance of the Greek element. So it was with the Jews, but in their case the old religion had much more persistence than in other Hellenistic circles, though in other respects they too yielded to the superior force of Greek civilization. This we must hold to have been the case not only in Alexandria but throughout the diaspora from the commencement of the Hellenistic period down to the later Roman Empire. It was only after ancient civilization gave way before the barbarian immigrations and the rising force of Christianity that rabbinism became supreme even among the Jews of the diaspora. This Hellenistico-Judaic phase of culture is sometimes called "Alexandrian," and the expression is justifiable if it only means that in Alexandria it attained its highest development and flourished most. For here the Jews began to busy themselves with Greek literature even under their clement rulers, the first Ptolemies, and here the law and other Scriptures were first translated into Greek; here the process of fusion began earliest and proceeded with greatest rapidity; here, therefore, also the Jews first engaged in a scientific study of Greek philosophy and transplanted that philosophy to the soil of Judaism. We read of a Jewish philosopher Aristobulus in the time of Ptolemy VI. Philometor, in the middle of the 2nd century B.C., of whose philosophical commentary on the Pentateuch fragments have been preserved by Clement of Alexandria and Eusebius. So far as we can judge from these, his aim was to put upon the sacred text a sense which should appeal even to Greek readers, and in particular to get rid of all anthropomorphic utterances about God. Eusebius regards him as a Peripatetic. We may suppose that this philosophical line of thought had its representatives in Alexandria between the times of Aristobulus and Philo, but we are not acquainted with the names of any such. Philo certainly, to judge by his historical influence, was the greatest of all these Jewish philosophers, and in his case we can follow in detail the methods by which Greek culture was harmonized with Jewish faith. On one side he is quite a Greek, on the other quite a Jew. His language is formed on the best classical models, especially Plato. He knows and often cites the great Greek poets, particularly Homer and the tragedians, but his chief studies had been in Greek philosophy, and he speaks of Heraclitus, Plato, the Stoics and the Pythagoreans in terms of the highest veneration. He had appropriated their doctrines so completely that he must himself be reckoned among the Greek philosophers; his system was eclectic, but the borrowed elements are combined into a new unity with so much originality that at the same time he may fairly be regarded as representing a philosophy of his own, which has for its characteristic feature the constant prominence of a fundamental religious idea. Philo's closest affinities are with Plato, the later Pythagoreans and the Stoics.[2] Yet with all this Philo remained a Jew, and a great part of his writings is expressly directed to recommend Judaism to the respect and, if possible, the acceptance of the Greeks. He was not a stranger to the specifically Jewish culture that prevailed in Palestine; in Hebrew he was not proficient, but the numerous etymologies he gives show that he had made some study of that language.[3] His method of exegesis is in point of form identical with that of the Palestinian scribes, and in point of matter coincidences are not absolutely rare.[4] But above all his whole works prove on every page that he felt himself to be thoroughly a Jew, and desired to be nothing else. Jewish "philosophy" is to him the true and highest wisdom; the knowledge of God and of things divine and human which is contained in the Mosaic Scriptures is to him the deepest and the purest.

If now we ask wherein Philo's Judaism consisted we must answer that it lies mainly in the formal claim that the Jewish people, in virtue of the divine revelation given to Moses, possesses the true knowledge in things religious. Thoroughly Jewish is his recognition that the Mosaic Scriptures of the Pentateuch are of absolute divine authority, and that everything they contain is valuable and significant because divinely revealed. The other Jewish Scriptures are also recognized as prophetic, *i.e.* as the writings of inspired men, but he does not place them on the same lines with the law, and he quotes them so seldom that we cannot determine the compass of his canon. The

[1] Euseb. *H. E.* ii. 17, 1; Jer. *ut supra*; Phot. *Bibl.* Cod. 105; Suid., *s.v.* "Φίλων."

[2] The fathers of the Church have specially noticed his Platonism and Pythagoreanism; an old proverb even says, with some exaggeration, ἢ Πλάτων φιλωνίζει ἢ Φίλων πλατωνίζει (Jerome, Photius and Suidas, *ut supra*). Clement of Alexandria directly calls him a Pythagorean. Eusebius (*H. E.* ii. 4, 3) observes both tendencies. Recent writers, especially Zeller, lay weight also on his Stoic affinities, and with justice, for the elements which he borrows from Stoicism are as numerous and important as those derived from the other two schools.

[3] See the list of these in Vallarsi's edition of Jerome (iii. 731–734), and compare Siegfried, "Philonische Studien," in *Merx's Archiv.* ii. 143–163 (1872).

His published works include numerous speeches and pamphlets, including those connected with his well-known Roman Catholic controversy with Charles Butler (1750–1832). He was an energetic supporter of the Tory party, even when it acted contrary to his views in passing the Roman Catholic Emancipation Act of 1829. He died on the 18th of September 1869. "Henry of Exeter," as he was commonly called, was one of the most striking figures in the English Church of the 18th century. His intellect was strong rather than broad, his position being that of the traditional High Churchman, with little sympathy either with the Evangelicals or with the Tractarians. On the one hand the famous Gorham judgment was the outcome of his refusal to institute to the living of Brampford Speke a clergyman George Cornelius Gorham (1787–1857), who had openly disavowed his belief in baptismal regeneration; on the other he denounced the equally famous Tract XC. in his episcopal charge of 1843. As bishop he was a strict disciplinarian, and

that of (divine) "Reason." In Greek philosophy, again, Philo, as we have seen, chiefly follows the Platonic doctrines of Ideas and the Soul of the World, and the Stoic doctrine of God as the λόγος or Reason operative in the world. In its Stoic form the latter doctrine was pantheistic; but Philo could adapt it to his purpose simply by drawing a sharper distinction between the Logos and the world.

Like his doctrine of God, Philo's doctrine of the world and creation rests on the presupposition of an absolute metaphysical contrast between God and the world. The world can be ascribed to God only in so far as it is a cosmos or orderly world; its material substratum is not even indirectly referable to God. Matter (ὕλη, or, as the Stoics said, οὐσία) is a second principle, but in itself an empty one, its essence being a mere negation of all true being. It is a lifeless, unmoved, shapeless mass, out of which God formed the actual world by means of the Logos and divine Forces. Strictly speaking, the world is only formed, not created, since matter did not originate with God.

Philo's doctrine of man is also strictly dualistic, and is mainly derived from Plato. Man is a twofold being, with a higher and a lower origin. Of the pure souls which fill airy space, those nearest the earth are attracted by the sensible and descend into sensible bodies; these souls are the Godward side of man. But on his other side man is a creature of sense, and so has in him a fountain of sin and all evil. The body, therefore, is a prison, a coffin, or a grave for the soul which seeks to rise again to God. From this anthropology the principles of Philo's ethics are derived, its highest maxim necessarily being deliverance from the world of sense and the mortification of all the impulses of sense. In carrying out this thought, as in many other details of his ethical teaching, Philo closely follows the Stoics. But he is separated from Stoical ethics by his strong religious interests, which carry him to very different views of the means and aim of ethical development. The Stoics cast man upon his own resources; Philo points him to the assistance of God, without whom man, a captive to sense, could never raise himself to walk in the ways of true wisdom and virtue. And as moral effort can bear fruit only with God's help, so too God Himself is the goal of that effort. Even in this life the truly wise and virtuous is lifted above his sensible existence, and enjoys in ecstasy the vision of God, his own consciousness sinking and disappearing in the divine light. Beyond this ecstasy there lies but one further step, viz. entire liberation from the body of sense and the return of the soul to its original condition; it came from God and must rise to Him again. But natural death brings this consummation only to those who, while they lived on earth, kept themselves free from attachment to the things of sense; all others must at death pass into another body; transmigration of souls is in fact the necessary consequence of Philo's premises, though he seldom speaks of it expressly.

Philo's literary labours have a twofold object, being directed either to expound the true sense of the Mosaic law, *i.e.* the philosophy which we have just described, to his Jewish brethren, or to convince heathen readers of the excellence, the supreme purity and truth, of the Jewish religion, whose holy records contain the deepest and most perfect philosophy, the best and most humane legislation. Thus as a literary figure Philo, in conformity with his education and views of life, stands between the Greeks and the Jews, seeking to gain the Jews for Hellenism and the Greeks for Judaism, yet always taking it for granted that his standpoint really *is* Jewish, and just on that account truly philosophical and cosmopolitan.

The titles of the numerous extant writings of Philo present at first sight a most confusing multiplicity. More than three-fourths of them, however, are really mere sections of a small number of larger works. Three such great works on the Pentateuch can be distinguished.

I. The smallest of these is the Ζητήματα καὶ λύσεις (*Quaestiones et solutiones*), a short exposition of Genesis and Exodus, in the form of question and answer. The work is cited under this title by Eusebius (*H. E.* ii. 18, 1, 5; *Praep. Ev.* vii. 13), and by later writers, but the Greek text is now almost wholly lost, and only about one-half preserved in an Armenian translation. Genesis seems to have occupied six books.[1] Eusebius tells us that Exodus filled five books. In the Armenian translation, first published by the learned Mechitarist, J. Bapt. Aucher, in 1826, are preserved four books on Genesis and two on Exodus, but with lacunae. A Latin fragment, about half of the fourth book on Genesis (*Phil. Jud. CII. quaestt. . . . super Gen.*), was first printed at Paris in 1520. Of the Greek we have numerous but short fragments in various Florilegia.[2] The interpretations in this work are partly literal and partly allegorical.

II. Philo's most important work is the Νόμων ἱερῶν ἀλληγορίαι (Euseb. *H. E.* ii. 18, 1; Phot. *Bibl.* Cod. 103), a vast and copious allegorical commentary on Genesis, dealing with chaps ii.–iv., verse by verse, and with select passages in the later chapters. The readers in view are mainly Jews, for the form is modelled on the rabbinic Midrash. The main idea is that the characters which appear in Genesis are properly allegories of states of the soul (τρόποι τῆς ψυχῆς). All persons and actions being interpreted in this sense, the work as a whole is a very extensive body of psychology and ethics. It begins with Gen. ii. 1, for the *De mundi opificio*, which treats of the creation according to Gen. i., ii., does not belong to this series of allegorical commentaries, but deals with the actual history of creation, and that under a quite different literary form. With this exception, however, the Νόμων ἀλληγορίαι includes all the treatises in the first volume of Mangey's edition, viz.—Νόμων ἱερῶν ἀλληγορίαι πρῶται τῶν μετὰ τὴν ἑξαήμερον (*Legum allegoriarum*, lib. i., M. i. 43–65), on Gen. ii. 1–17. (2) Νόμ. ἱερ. ἀλλ. δεύτεραι (*Leg. all.* lib. ii., M. i. 66–86), on Gen. ii. 18–iii. 1a. (3) Νόμ. ἱερ. ἀλλ. τρίται (*Leg. all.* lib. iii., M. i. 87–137), on Gen. iii. 8b–19. The commentaries on Gen. iii. 1b–8a, 20–23 are lost. (4) Περὶ τῶν χερουβὶμ καὶ τῆς φλογίνης ῥομφαίας καὶ τοῦ κτισθέντος πρώτου ἐξ ἀνθρώπου Κάϊν (*De cherubim et flammeo gladio*, M. i. 138–162), on Gen. iii. 24 and iv. 1. (5) Περὶ ὧν ἱερουργοῦσιν Ἄβελ τε καὶ Κάϊν (*De sacrificiis Abelis et Caini*, M. i. 163–190), on Gen. iv. 2–4. The commentaries on Gen. iv. 5–7 are lost. (6) Περὶ τοῦ τὸ χεῖρον τῷ κρείττονι φιλεῖν ἐπιτίθεσθαι (*Quod deterius potiori insidiari soleat*, M. i. 191–225), on Gen. iv. 8–15. (7) Περὶ τῶν τοῦ δοκησισόφου Κάϊν ἐγγόνων καὶ ὡς μετανάστης γίνεται (*De posteritate Caini*, &c., M. i. 226–261), on Gen. iv. 16–25; this book, which is wanting in editions prior to Mangey's, is incorrectly given by him, but much more correctly by Tischendorf, *Philonea*, pp. 84–143. None of the preceding is mentioned by its special title by Euseb. *H.E.* ii. 18, while he cites all that follow by their titles. The reason must be that all up to this point, and no further, are included by him in the Νόμων ἱερῶν ἀλληγορίαι; agreeing with this we find that these, and these only, are cited under that general title in the Florilegia, especially the so-called *Johannes Monachus ineditus* (see Mangey's notes before each book). We may therefore conclude with confidence that Philo published the continuous commentaries on Gen. ii.–iv. under the title *Allegories of the Sacred Laws*, and the following commentaries on select passages under special titles, though the identity of literary character entitles us to regard the latter as part of the same great literary plan with the former. (8) Περὶ γιγάντων (*De gigantibus*, M. i. 262–272), on Gen. vi. 1–4. (9) Ὅτι ἄτρεπτον τὸ θεῖον (*Quod Deus sit immutabilis*, M. i. 272–299), on Gen. vi. 4–12. (10) Περὶ γεωργίας (*De agricultura*, M. i. 300–328), on Gen. ix. 20a. (11) Περὶ φυτουργίας Νῶε τὸ δεύτερον (*De plantatione Noe*, M. i. 329–356), on Gen. ix. 20b. (12) Περὶ μέθης (*De ebrietate*, M. i. 357–391), on Gen. ix. 21; the introduction shows that this book was preceded by another which put together the views of the philosophers about drunkenness. (13) Περὶ τοῦ ἐξένηψε Νῶε (*De sobrietate*, M. i. 392–403), on Gen. ix. 24. (14) Περὶ συγχύσεως διαλέκτων (*De confusione linguarum*, M. i. 404–435), on Gen. xi. 1–9. (15) Περὶ ἀποικίας (*De migratione Abrahami*, M. i. 436–472), on Gen. xii. 1–6. (16) Περὶ τοῦ τίς ὁ τῶν θείων πραγμάτων κληρονόμος (*Quis rerum divinarum haeres sit?* M. i. 473–518), on Gen. xv. 1–18. (17) Περὶ τῆς εἰς τὰ προπαιδεύματα συνόδου (*De congressu quaerendae eruditionis causa*, M. i. 519–545), on Gen. xvi. 1–6. (18) Περὶ φυγάδων (*De profugis*, M. i. 546–577), on Gen. xvi. 6–14. (19) Περὶ τῶν μετονομαζομένων καὶ ὧν ἕνεκα μετονομάζονται (*De mutatione nominum*, M. i. 578–619), on Gen. xvii. 1–22; in this work Philo mentions that he had written two books, now wholly lost, Περὶ διαθηκῶν (M. i. 586). (20) Περὶ τοῦ θεοπέμπτους εἶναι τοὺς ὀνείρους (*De somniis*, lib. i., M. i. 620–658), on the two dreams of Jacob, Gen. xxviii. and xxxi. (21) Book ii. of the same (M. i. 659–699), on the dreams of Joseph, the chief butler, the chief baker, and Pharaoh, Gen. xxxvii. and xl., xli. Eusebius makes Philo the author of five books on dreams; three, therefore, are lost.

III. A work of a very different kind is the group of writings which we may call "An Exposition of the Mosaic law for Gentiles," which, in spite of their very various contents, present on nearer examination indubitable marks of close connexion. In them Philo seeks to give an orderly view of the chief points of the Mosaic legislation in the Pentateuch, and to recommend it as valuable to Gentile readers. The method of exposition is somewhat more popular than in the allegorical commentaries, for, though that method of interpretation is not wholly excluded, the main object is to give such a view of the legislation as Philo accepted as historical. This work has three main divisions: (*a*) an Account of the creation (κοσμοποιία) which Moses put first to show that his

[1] See, especially Mai, *Scriptt. vett. nov. coll.* vol. vii. pt. i. pp. 100, 106, 108.

[2] See *Opp.*, ed. Mangey, ii. 648–680; Mai, *op. cit.*, vol. vii. pt. i. 96 seq.; Euseb. *Praep. Ev.* vii. 13. A fragment on the cherubim, Exod. xxv. 18, has been published by Mai, *Class. Auctt.* iv. 430 seq., by Grossmann (1856) and by Tischendorf (p. 144 seq.).

legislation was conformed to the will of nature, and that therefore those who followed it were true cosmopolitans; (*b*) the Biographies of the Virtuous—being, so to speak, the living unwritten laws which, unlike written laws, present the general types of moral conduct; (*c*) Legislation Proper, in two subdivisions—(*a*) the ten principal chapters of the law, (*β*) the special laws belonging to each of these ten. An appendix adds a view of such laws as do not fall under the rubrics of the decalogue, arranged under the headings of certain cardinal virtues.

The treatises which belong to this work are the following: (1) Περὶ τῆς Μωϋσέως κοσμοποιΐας (*De mundi opificio*, M. i. 1–42). This work does not fall within the number of the allegorical commentaries. On the other hand, the introduction to the treatise *De Abrahamo* makes clear its immediate connexion with the *De mundi opificio*. The position of the *De mundi opificio* at the head of the allegorical commentaries, which is at present usual in the editions, seems indeed to go back to a very early date, for even Eusebius cites a passage from it with the formula ἀπὸ τοῦ πρώτου τῶν εἰς τὸν νόμον (*Praep. Ev.* viii. 12 fin., ed. Gaisford). The group of the Βίοι σοφῶν is headed by (2) Βίος σοφοῦ τοῦ κατὰ διδασκαλίαν τελειωθέντος ἢ περὶ νόμων ἀγράφων [*a*], ὅ ἐστι περὶ Ἀβραάμ (*De Abrahamo*, M. ii. 1–40). Abraham is here set forth as the type of διδασκαλικὴ ἀρετή, *i.e.* of virtue as a thing learned. This biography of Abraham was followed by that of Isaac as a type of φυσικὴ ἀρετή, *i.e.* of innate or natural virtue, which in turn was succeeded by that of Jacob as representing ἀσκητικὴ ἀρετή, *i.e.* virtue acquired by practice; but both these are now lost. Hence in the editions the next treatise is (3) Βίος πολιτικὸς ὅπερ ἐστὶ περὶ Ἰωσήφ (*De Josepho*, M. ii. 41–79), where Joseph is taken as the pattern of the wise man in his civil relations. The Biographies of the Virtuous are followed by (4) Περὶ τῶν δέκα λογίων ἃ κεφάλαια νόμων εἰσί (*De decalogo*, M. ii. 180–209) and (5) Περὶ τῶν ἀναφερομένων ἐν εἴδει νόμων εἰς τὰ συντείνοντα κεφάλαια τῶν δέκα λόγων (*De specialibus legibus*; the unabridged title is given by Eusebius, *H.E.* ii. 18, 5). Here under the rubrics of the ten commandments a systematic review of the special laws of the Mosaic economy is given; for example, under the first and second commandments (divine worship) a survey is taken of the entire legislation relating to priesthood and sacrifice; under the fourth (*i.e.* the Sabbath law, according to Philo's reckoning) there is a survey of all the laws about feasts; under the sixth (adultery) an account of matrimonial law; and so on. According to Eusebius the work embraced four books, which seem to have reached us entire, but in the editions have been perversely broken up into a considerable number of separate tractates. (*a*) The first book (on the first and second commandments) includes the following: *De circumcisione* (M. ii. 210–212); *De monarchia*, lib. i. (ii. 213–222); *De monarchia*, lib. ii. (ii. 222–232); *De praemiis sacerdotum* (ii. 232–237); *De victimis* (ii. 237–250); *De sacrificantibus*, or *De victimas offerentibus* (ii. 251–264); *De mercede meretricis non accipienda in sacrarium* (ii. 264–269). (*b*) The second book (on the third, fourth and fifth commandments, *i.e.* on perjury, Sabbath observance, and filial piety) is incomplete in Mangey (ii. 270–298), the section *De septenario* (on the Sabbath and feasts in general) being imperfect, and that *De colendis parentibus* being entirely wanting. Mai to a large extent made good the defect (*De cophini festo et de colendis parentibus*, Milan, 1818), but Tischendorf was the first to edit the full text (*Philonea*, pp. 1–83). (*c*) The third book relates to the sixth and seventh commandments (adultery and murder; M. ii. 299–334). (*d*) To the fourth book (relating to the last three commandments) belongs all that is found in Mangey, ii. 335–374, that is to say, not merely the tractates *De judice* (ii. 344–348) and *De concupiscentia* (ii. 348–358), but also those *De justitia* (ii. 358–361) and *De creatione principum* (ii. 361–374). The last-named is, properly speaking, only a portion of the *De justitia*, which, however, certainly belongs to the fourth book, of which the superscription expressly bears that it treats also περὶ δικαιοσύνης. With this tractate begins the appendix to the work *De specialibus legibus*, into which, under the rubric of certain cardinal virtues, such Mosaic laws are brought together as could not be dealt with under any of the decalogue rubrics. The continuation of this appendix forms a book by itself. (6) Περὶ τριῶν ἀρετῶν ἤτοι περὶ ἀνδρείας καὶ φιλανθρωπίας καὶ μετανοίας (*De fortitudine*, M. ii. 375–383; *De caritate*, ii. 383–405; *De poenitentia*, ii. 405–407). Finally, in less intimate connexion with this entire work is another treatise still to be mentioned, (7) Περὶ ἄθλων καὶ ἐπιτιμίων (*De praemiis et poenis*, M. ii. 408–428) and Περὶ ἀρῶν (*De execrationibus*, M. ii. 429–457), two parts which constitute a single whole and deal with the promises and threatenings of the law.

IV. Besides the above-named three great works on the Pentateuch, Philo was the author of a number of isolated writings, of which the following have reached us either in their entirety or in fragments. (1) Περὶ βίου Μωσέως (*Vita Mosis*, lib. i.–iii., M. ii. 80–179). It is usual to group this, as being biographical in its character, with the Βίοι σοφῶν, and thus to incorporate it immediately after the *De Josepho* with the large work on the Mosaic legislation. But, as has been seen, the Βίοι σοφῶν are intended to represent the general types of morality, while Moses is by no means so dealt with, but as a unique individual. All that can be said is that the literary character of the *Vita Mosis* is the same as that of the larger work. As in the latter the Mosaic legislation, so in the former the activity of the legislator himself, is delineated for the benefit of Gentile readers. (2) Περὶ τοῦ πάντα σπουδαῖον εἶναι ἐλεύθερον (*Quod omnis probus liber*, M. ii. 445–470). In the introduction to this treatise reference is made to an earlier book which had for its theme the converse proposition. The complete work was still extant in the time of Eusebius (*H. E.* ii. 18, 6): Περὶ τοῦ δοῦλον εἶναι πάντα φαῦλον, ᾧ ἑξῆς ἐστιν ὁ περὶ τοῦ πάντα σπουδαῖον ἐλεύθερον εἶναι. The genuineness of the writing now possessed by us is not undisputed: but see Lucius, *Der Essenismus* (1881), pp. 13–23. (3) Εἰς Φλάκκον (*Adversus Flaccum*, M. ii. 517–544) and (4) Περὶ ἀρετῶν καὶ πρεσβείας πρὸς Γάϊον (*De legatione ad Gaium*, M. ii. 545–600). These two works have a very intimate connexion. In the first Philo relates how the Roman governor Flaccus in Alexandria, towards the beginning of the reign of Caligula, allowed the Alexandrian mob, without interference, to insult the Jews of that city in the grossest manner, and even to persecute them to the shedding of blood. In the second he tells how the Jews had been subjected to still greater sufferings through the command of Caligula that divine honours should be everywhere accorded to him, and how the Jews of Alexandria in vain sought relief by a mission to Rome which was headed by Philo. But both together were only parts of a larger work, in five books, of which the first two and the last have perished. For it is clear from the introduction to the *Adversus Flaccum* that it had been preceded by another book in which the Jewish persecutions by Sejanus, under the reign of Tiberius, were spoken of, and the *Chronicon* of Eusebius (ed. Schoene, ii. 150, 151) informs us that these persecutions of Sejanus were related in the second book of the work now under discussion. But from the conclusion of the *Legatio ad Gaium*, which we still possess, we learn that it was also followed by another book which exhibited the παλινῳδία, or change of Jewish fortunes for the better. Thus we make out five books in all—the number actually given by Eusebius (*H.E.* ii. 5, 1). (5) Περὶ προνοίας (*De providentia*). This work has reached us only in an Armenian translation, which has been edited, with a Latin translation, by Aucher (see below), 1822. It is mentioned by its Greek title in Eusebius (*H.E.* ii. 18, 6; *Praep. Ev.* vii. 20 fin., viii. 13 fin., ed. Gaisford). The Armenian text gives two books, but of these the first, if genuine at all, at any rate appears only in an abridged and somewhat revised state.[1] Eusebius (*Praep. Ev.* viii. 14) quotes from the second book to an extent that amounts to a series of excerpts from the whole. The short passage in *Praep. Ev.* vii. 21, is also taken from this book; and it appears that Eusebius knew nothing at all about the first. (6) Ἀλέξανδρος ἢ περὶ τοῦ λόγον ἔχειν τὰ ἄλογα ζῷα (*De Alexandro et quod propriam rationem muta animalia habeant*; so Jerome, *De Vir. Ill.* c. 11); the Greek title is given in Euseb. *H.E.* ii. 18, 6. This also now exists only in an Armenian translation, which has been edited by Aucher. Two small Greek fragments occur in the *Florilegium* of Leontius and Johannes (Mai, *Scr. vet. nov. coll.* vii. 1, pp. 99, 100a). (7) Ὑποθετικά, a writing now known to us only through fragments preserved in Euseb. *Praep. Ev.* viii. 6, 7. The title, as Bernays[2] has shown, means "Counsels," "Recommendations," the reference being to such laws of the Jews as can be recommended also to non-Jewish readers. (8) Περὶ Ἰουδαίων, a title met with in Euseb. *H. E.* ii. 18, 6. The writing is no doubt the same as Ἡ ὑπὲρ Ἰουδαίων ἀπολογία, from which a quotation is given in Euseb. *Praep. Ev.* viii. 11. To this place also, perhaps, belongs the *De nobilitate* (M. ii. 437–444), which treats of that true noblesse of wisdom in which the Jewish people also is not wanting.[3]

V. *The doubtful treatises:* (1) Περὶ βίου θεωρητικοῦ ἢ ἱκετῶν ἀρετῶν (*De vita contemplativa*). This contains the sole original account of an ascetic community known as the Therapeutae (*q.v.*) having their home on the shores of Lake Mareotis. These were held by Eusebius and many other Christian writers to be the earliest Christian monks, which of course could not be the case if it was a genuine work of Philo. On this account, amongst others, it was held to be spurious by Graetz and P. E. Lucius; and this view gradually received the assent of most modern scholars. Latterly, however, L. Massebieau has shown with great thoroughness that in language and thought alike it is essentially Philonic, and the genuineness of the book has also been affirmed by P. Wendland, and especially by F. C. Conybeare. (2) Περὶ ἀφθαρσίας κόσμου (*De incorruptibilitate mundi*), declared unauthentic by Z. Frankel and J. Bernays, has been successfully defended by F. Cumont. (3) Περὶ κόσμου (*De mundo*). It is generally agreed that, in L. Cohn's words, this is "nothing but a compilation from various portions of the περὶ ἀφθαρσίας κόσμου and other Philonic works." (4) Two discourses, *De Sampsone* and *De Iona*, extant only in Armenian, and certain other writings of the same kind. These appear only to have been imputed to Philo by chance, and certainly cannot claim to be his work. (5) Περὶ τοῦ πάντα σπουδαῖον εἶναι ἐλεύθερον (*Quod omnis probus liber sit*) has been questioned by Z. Frankel and R. Ausfeld; but their arguments would rather point to its being an early work of Philo, which P. Wendland believes to be the case. (6) Περὶ προνοίας (*De providentia*), which we possess as a whole

[1] See Diels, *Doxographi Graeci*, 1879, pp. 1-4; Zeller, *Phil. d. Gr.* iii. 2, p. 340 (3rd ed).

[2] *Monatsb. d. Berl. Akad.* (1876), pp. 589–609.

[3] This conjecture is Dähne's, *Theol. Stud. u. Krit.* (1833), pp. 990, 1037.

only in an Armenian version, consists of two books, the first of which appears to be in a Christian recension, but there is no reason for denying its Philonic origin.

EDITIONS.—Till recent days the best edition was that of Mangey (2 vols., London, 1742); the handiest the Holtze duodecimo (Leipzig, 1851). Both are still very useful, but for scholars they will be superseded by the enlarged and critical edition of Leopold Cohn and Paul Wendland (Berlin, 1896–1902). See also papers by Cohn in *Hermes*, xxxviii. (1903) and xliii. (1908). There is an English translation of the old text by C. D. Yonge (4 vols., London, 1854).

LITERATURE.—The best special studies of Philo will be found in Siegfried, *Philo von Alex.* (Jena, 1875); Drummond, *Philo-Judaeus* (London, 1888). For his place in philosophy, see Zeller, *Phil. der Griechen* (1881). For his relation to Palestinian speculation, B. Ritter, *Philo und die Halacha* (Leipzig, 1879). An excellent general account will be found in Schürer, *The Jewish People in the time of Jesus Christ* (Eng. trans., 1891), or in Dr Edersheim's article on Philo in the *Dictionary of Christian Biography*. For the question of the genuineness and historical value of the *De vita contemplativa*, see L. Massebieau, in *Revue de l'histoire des religions*, vol. xvi. (Paris, 1887); F. C. Conybeare, *Philo: About the Contemplative Life* (Oxford, 1895); G. Fayot, *Études sur les thérapeutes* (Genève, 1880); P. E. Lucius, *Die Therapeuten* (Strassburg, 1880); P. Wendland, *Die Therapeuten* (Leipzig, 1896). Also F. Cumont, *Philo, de aet. mundi* (1891); J. Bernays in the *Abhand. der k. Akad. der Wiss.* (1876). (E. S.*; C. Bi.)

PHILO OF BYZANTIUM, Greek writer on mechanics, flourished during the latter half of the 2nd century B.C. (according to some, a century earlier). He was the author of a large work (Μηχανικὴ σύνταξις), of which the fourth and (in epitome) fifth books are extant, treating of missiles, the construction of fortresses, provisioning, attack and defence (ed. R. Schöne, 1893, with German translation in H. Köchly's *Griechische Kriegsschriftsteller*, vol. i. 1853; E. A. Rochas d'Aiglun, *Poliorcétique des Grecs*, 1872). Another portion of the work, on pneumatic engines, has been preserved in the form of a Latin translation (*De ingeniis spiritualibus*) made from an Arabic version (ed. W. Schmidt, with German translation, in the works of Heron of Alexandria, vol. i., in "Teubner Series," 1899; with French translation by Rochas, *La Science des philosophes . . . dans l'antiquité*, 1882).

A little treatise *On the Seven Wonders of the World*, wrongly attributed to Philo, probably belongs to the 6th century A.D. It is printed in R. Hercher's Aelian (1858).

PHILO OF LARISSA, Greek philosopher of the first half of the 1st century B.C. During the Mithradatic wars he left Athens and took up his residence in Rome. He was a pupil of Clitomachus, whom he succeeded as head of the Third or New Academy. According to Sextus Empiricus, he was the founder of the Fourth Academy, but other writers refuse to admit the separate existence of more than three academies (see ACADEMY, GREEK). In Rome he lectured on rhetoric and philosophy, and collected around him many eminent pupils, amongst whom Cicero was the most famous and the most enthusiastic. None of his works is extant; our knowledge of his views is derived from Numenius, Sextus Empiricus and Cicero. In general, his philosophy was a reaction against the sceptic or agnostic position of the Middle and New Academy in favour of the dogmatism of Plato.

See Grysar, *Die Akademiker Philo und Antiochus* (1849); Hermann, *De Philone Larissaeo* (Göttingen, 1851 and 1855).

PHILO, HERENNIUS, of Byblus, Greek grammarian, was born, according to Suidas, in A.D. 42. He lived into the reign of Hadrian, of which he wrote a history, now lost. He was the author of various works: *On the Acquisition and Choice of Books*; *On Cities and their Famous Men*, epitomized by the grammarian Aelius Serenus, and one of the chief authorities used by Hesychius and Stephanus of Byzantium; *On Synonyms*, of which there is extant an epitome by Ammonius Grammaticus. But he is chiefly known for his translation of the Phoenician history of Sanchuniathon, who was said to have lived before the Trojan war. Of this work considerable fragments have been preserved, chiefly by Eusebius in the *Praeparatio evangelica* (i. 9, 10; iv. 16). They present a euhemeristic *réchauffé* of Phoenician theology and mythology, which is represented as translated from the original Phoenician. Sanchuniathon is probably an imaginary personage, whose name is formed from that of the Phoenician god Sanchon.

Editions of the fragments by J. C. Orelli (1826) and C. Müller, *Frag. hist. graec.* vol. iii. In 1836 F. Wagenfeld brought out what claimed to be a complete translation by Philo (from a MS. discovered in a convent in Portugal, now considered spurious). There are English translations by I. P. Cory (1828) and Bishop R. Cumberland (1720).

PHILOCHORUS, of Athens, Greek historian during the 3rd century B.C., was a member of a priestly family. He was a seer and interpreter of signs, and a man of considerable influence. He was strongly anti-Macedonian in politics, and a bitter opponent of Demetrius Poliorcetes. When Antigonus Gonatas, the son of the latter, besieged and captured Athens (261), Philochorus was put to death for having supported Ptolemy Philadelphus, who had encouraged the Athenians in their resistance to Macedonia. His investigations into the usages and customs of his native Attica were embodied in an *Atthis*, in seventeen books, a history of Athens from the earliest times to 262 B.C. Considerable fragments are preserved in the lexicographers, scholiasts, Athenaeus, and elsewhere. The work was epitomized by the author himself, and later by Asinius Pollio of Tralles (perhaps a freedman of the famous Gaius Asinius Pollio). Philochorus also wrote on oracles, divination and sacrifices; the mythology and religious observances of the tetrapolis of Attica; the myths of Sophocles; the lives of Euripides and Pythagoras; the foundation of Salamis. He compiled chronological lists of the archons and Olympiads, and made a collection of Attic inscriptions, the first of its kind in Greece.

Fragments and life in C. W. Müller, *Fragmenta historicorum graecorum*, vol. i. (1841); A. Böckh, *Gesammelte kleine Schriften*, vol. v. (1871), on the plan of the work; J. Strenge, *Quaestiones philochoreae* (Göttingen, 1868); C. Wachsmuth, *Einleitung in das Studium der alten Geschichte* (1895).

PHILOCTETES, in Greek legend, son of Poeas king of the Malians of Mt Oeta, one of the suitors of Helen and a celebrated hero of the Trojan War. Homer merely states that he was distinguished for his prowess with the bow; that he was bitten by a snake on the journey to Troy and left behind in the island of Lemnos; and that he subsequently returned home in safety. These brief allusions were elaborated by the "cyclic" poets, and the adventures of Philoctetes formed the subject of tragedies by Aeschylus, Sophocles and Euripides. In the later form of the story Philoctetes was the friend and armour-bearer of Heracles, who presented him with his bow and poisoned arrows as a reward for kindling the fire on Mt Oeta, on which the hero immolated himself. Philoctetes remained at Lemnos till the tenth year of the war. An oracle having declared that Troy could not be taken without the arrows of Heracles, Odysseus and Diomedes (or Neoptolemus) were sent to fetch Philoctetes. On his arrival before Troy he was healed of his wound by Macha n, and slew Paris; shortly afterwards the city was taken. On his return to his own country, finding that a revolt had broken out against him, he again took ship and sailed for Italy, where he founded Petilia and Cremissa. He fell fighting on the side of a band of Rhodian colonists against some later immigrants from Pallene in Achaea. His tomb and sanctuary were shown at Macalla, on the coast of Bruttium.

Of the Aeschylean and Euripidean tragedies only a few fragments remain; of the two by Sophocles, one is extant, the other, dealing with the fortunes of Philoctetes before Troy, is lost. Some light is thrown upon the lost plays by Dio Chrysostom, who in one of his discourses (52) describes his reading of the three tragedies, and in another (59) gives a prose version of the opening of the *Philoctetes* of Euripides. Philoctetes was also the subject of tragedies by Achaeus of Eretria, Euphorion of Chalcis and the Roman tragedian Accius. According to F. Marx (*Neue Jahrbücher für das klassische Altertum*, 1904, p. 673–685), Philoctetes did not appear in the original legend of Troy. He is a form of the Lemnian Hephaestus, who alighted on the island when flung out of Olympus by Zeus. Like him, he is lame and an outcast for nine years; like him, he is brought back in time of need. His connexion with the fall of Troy indicates that the fire-god himself set fire to the city; in like manner no other than the fire-god was thought worthy to kindle the pyre of Heracles.

See Homer, *Iliad*, ii. 718, *Odyssey*, iii. 190, viii. 219; Sophocles, *Philoctetes*, and Jebb's *Introduction*; Diod. Sic. iv. 38; Philostratus, *Heroica*, 6; Strabo vi. 254; Hyginus, *Fab.* 36, 102.

PHILODEMUS, Epicurean philosopher and poet, was born at Gadara in Coele-Syria early in the 1st century B.C., and

settled in Rome in the time of Cicero. He was a friend of Calpurnius Piso, and was implicated in his profligacy by Cicero (*in Pisonem*, 29), who, however, praises him warmly for his philosophic views and for the *elegans lascivia* of his poems (cf. Horace, *Satires*, I. 2. 120). The Greek anthology contains thirty-four of his epigrams. From the excavations of the villa at Herculaneum (*q.v.*) there have been recovered thirty-six treatises attributed to Philodemus, and it has been suggested that the villa was actually owned by him; but this is generally denied. These works deal with music, rhetoric, ethics, signs, virtues and vices, and defend the Epicurean standpoint against the Stoics and the Peripatetics.

The *Rhetoric* has been edited by Sudhaus (1892–1895); the *De Ira* and the *De Pietate* by Gomperz (1864 to 1865); the *De Musica* by Kempke (1884); *De Vitiis* by Ussing (1868); *De Morte* by Mekler (1886). See *Hercul. Volum.* (Oxford, 1824 and 1861); Mayor on Cicero's *De Natura deorum* (1871).

PHILOLAUS (b. *c.* 480), Greek philosopher of the Pythagorean school, was born at Tarentum or at Crotona[1] (so Diog. Laërt. viii. 84). He was said to have been intimate with Democritus, and was probably one of his teachers. After the death of Pythagoras great dissensions prevailed in the cities of lower Italy. According to some accounts, Philolaus, obliged to flee, took refuge first in Lucania and then at Thebes, where he had as pupils Simmias and Cebes, who subsequently, being still young men (νεανίσκοι), were present at the death of Socrates. Before this Philolaus had returned to Italy, where he was the teacher of Archytas. He entered deeply into the distinctively Pythagorean number theory, particularly dwelling on the properties inherent in the decad—the sum of the first four numbers, consequently the fourth triangular number, the *tetractys* (see *Vit. Pythag.* ap. *Phot. Bibl.* p. 712)—which he called great, all-powerful, and all-producing. The great Pythagorean oath was taken by the sacred *tetractys*. The discovery of the regular solids is attributed to Pythagoras by Eudemus, and Empedocles is stated to have been the first who maintained that there are four elements. Philolaus, connecting these ideas, held that the elementary nature of bodies depends on their form, and assigned the tetrahedron to fire, the octahedron to air, the icosahedron to water, and the cube to earth; the dodecahedron he assigned to a fifth element, aether, or, as some think, to the universe (see Plut. *de Pl. Ph.* ii. 6, *ἐκ δὲ τοῦ δωδεκαέδρου τὴν τοῦ παντὸς σφαῖραν* and Stob. *Ecl. Phys.* i. 10, *ὁ τᾶς σφαίρας ὁλκός*). This theory, however superficial from the standpoint of observation, indicates considerable knowledge of geometry and gave a great impulse to the study of the science. Following Parmenides, Philolaus regarded the soul as a "mixture and harmony" of the bodily parts; he also assumed a substantial soul, whose existence in the body is an exile on account of sin.

Philolaus was the first to propound the doctrine of the motion of the earth; some attribute this doctrine to Pythagoras, but there is no evidence in support of their view. Philolaus supposed that the sphere of the fixed stars, the five planets, the sun, moon and earth, all moved round the central fire, which he called the hearth of the universe, the house of Zeus, and the mother of the gods (see Stob. *Ecl. Phys.* i. 488); but as these made up only nine revolving bodies he conceived, in accordance with his number theory, a tenth, which he called counter-earth, *ἀντίχθων*. He supposed the sun to be a disk of glass which reflects the light of the universe. He made the lunar month consist of $29\frac{1}{2}$ days, the lunar year of 354, and the solar year of $365\frac{1}{4}$ days. He was the first who published a book on the Pythagorean doctrines, a treatise of which Plato made use in the composition of his Timaeus. This work of the Pythagorean, to which the mystical name Βάκχαι is sometimes given, seems to have consisted of three books: (1) Περὶ κόσμου, containing a general account of the origin and arrangement of the universe; (2) Περὶ φύσεως, an exposition of the nature of numbers; (3) Περὶ ψυχῆς, on the nature of the soul.

[1] Boeckh places his life between the 70th and 95th Olympiads ([illegible]–396 B.C.). He was a contemporary of Socrates and Democritus, [illegible] senior to them, and was probably somewhat junior to Empe[illegible]; so that his birth may be placed at about 480.

See Boeckh, *Philolaus des Pythagoreers Lehren nebst den Bruchstücken seines Werkes* (Berlin, 1819); Schaarschmidt, *Die angebliche Schriftstellerei des Philolaus* (1864); also Fabricius, *Bibliotheca graeca*; Zeller, *History of Greek Philosophy*; Chaignet, *Pythagore et la philosophie pythagoricienne, contenant les fragments de Philolaus et d'Archytas* (1873); Th. Gomperz, *Greek Thinkers* (Eng. trans. (1901), i. 123 sqq., 543 sqq. and authorities there quoted; also art. PYTHAGORAS. For fragments see Ritter and Preller, *Hist. Philosoph.* ch. ii.

PHILOLOGY, the generally accepted comprehensive name for the study of the word (Gr. λόγος), or languages; it designates that branch of knowledge which deals with human speech, and with all that speech discloses as to the nature and history of man. Philology has two principal divisions, corresponding to the two uses of "word" or "speech," as signifying either what is said or the language in which it is said, as either the thought expressed—which, when recorded, takes the form of literature—or the instrumentality of its expression: these divisions are the literary and the linguistic. Not all study of literature, indeed, is philological: as when, for example, the records of the ancient Chinese are ransacked for notices of astronomical or meteorological phenomena, or the principles of geometry are learned from the textbook of a Greek sage; while, on the other hand, to study Ptolemy and Euclid for the history of the sciences represented by them is philological more than scientific. Again, the study of language itself has its literary side: as when the vocabulary of a community (say of the ancient Indo-Europeans or Aryans) is taken as a document from which to infer the range and grade of knowledge of its speakers, their circumstances and their institutions. The two divisions thus do not admit of absolute distinction and separation, though for some time past tending toward greater independence. The literary is the older of the two; it even occupied until recently the whole field, since the scientific study of language itself has arisen only within the 19th century. Till then, literary philology included linguistic, as a merely subordinate and auxiliary part, the knowledge of a language being the necessary key to a knowledge of the literature written in that language. When, therefore, instead of studying each language by itself for the sake of its own literature men began to compare one language with another, in order to bring to light their relationships, their structures, their histories, the name "comparative philology" naturally enough suggested itself and came into use for the new method; and this name, awkward and trivial though it may be, has become so firmly fixed in English usage that it can be only slowly, if at all, displaced. European usage (especially German) tends more strongly than English to restrict the name philology to its older office, and to employ for the recent branch of knowledge a specific term, like those that have gained more or less currency with us also; as glottic, glossology, linguistics, linguistic science, science of language, and the like. It is not a question of absolute propriety or correctness, since the word philology is in its nature wide enough to imply all language-study of whatever kind; it is one, rather, of the convenient distinction of methods that have grown too independent and important to be any longer well included under a common name.

I.—*The Science of Language in general.*

Nature of the Science.

Philology, in all its departments, began and grew up as classical; the history of our civilization made the study of Greek and Latin long the exclusive, still longer the predominant and regulating, occupation of secular scholarship. The Hebrew and its literature were held apart, as something of a different order, as sacred. It was not imagined that any tongue to which culture and literature did not lend importance was worthy of serious attention from scholars. The first essays in comparison, likewise, were made upon the classical tongues, and were as erroneous in method and fertile in false conclusions as was to be expected, considering the narrowness of view and the controlling prejudices of those who made them; and the admission of Hebrew to the comparison only added to the confusion. The change which the past century has seen has been a part of the general scientific movement of the age, which has brought about the establishment

of so many new branches of knowledge, both historical and physical, by the abandonment of shackling prejudices, the freedom of inquiry, the recognition of the dignity of all knowledge, the wide-reaching assemblage of facts and their objective comparison, and the resulting constant improvement of method. Literary philology has had its full share of advantage from this movement; but linguistic philology has been actually created by it out of the crude observations and wild deductions of earlier times, as truly as chemistry out of alchemy, or geology out of diluvianism. It is unnecessary here to follow out the details of the development; but we may well refer to the decisive influence of one discovery, the decisive action of one scholar. It was the discovery of the special relationship of the Aryan or Indo-European languages, depending in great measure upon the introduction of the Sanskrit as a term in their comparison, and demonstrated and worked out by the German scholar Bopp, that founded the science of linguistic philology. While there is abundant room for further improvement, it yet appears that the grand features of philologic study, in all its departments, are now so distinctly drawn that no revolution of its methods, but only their modification in minor respects, is henceforth probable. How and for what purposes to investigate the literature of any people (philology in the more proper sense), combining the knowledge thus obtained with that derived from other sources; how to study and set forth the material and structure and combinations of a language (grammar), or of a body of related languages (comparative grammar); how to co-ordinate and interpret the general phenomena of language, as variously illustrated in the infinitely varying facts of different tongues, so as to exhibit its nature as a factor in human history and its methods of life and growth (linguistic science)—these are what philology teaches.

Relation to Anthropology.

The study of language is a division of the general science of anthropology (*q.v.*), and is akin to all the rest in respect to its objects and its methods. Man as we now see him is a twofold being: in part the child of nature, as to his capacities and desires, his endowments of mind and body; in part the creature of education, by training in the knowledge, the arts, the social conduct, of which his predecessors have gained possession. And the problem of anthropology is this: how natural man has become cultivated man; how a being thus endowed by nature should have begun and carried on the processes of acquisition which have brought him to his present state. The results of his predecessors' labours are not transmuted for his benefit into natural instincts, in language or in anything else. The child of the most civilized race, if isolated and left wholly to his own resources, aided by neither the example nor the instruction of his fellows, would no more speak the speech of his ancestors than he would build their houses, fashion their clothes, practise any of their arts, inherit their knowledge or wealth. In fact, he would possess no language, no arts, no wealth, but would have to go to work to acquire them, by the same processes which began to win them for the first human beings. One advantage he would doubtless enjoy: the descendant of a cultivated race has an enhanced aptitude for the reception of cultivation; he is more cultivable; and this is an element that has to be allowed for in comparing present conditions with past, as influencing the rate of progress, but nothing more. In all other respects it is man with the endowments which we now find him possessed of, but destitute of the gradually accumulated results of the exercise of his faculties, whose progress we have to explain. And it is, as a matter of necessity, by studying recent observable modes of acquisition, and transferring them, with due allowance for different circumstances, to the more primitive periods, that the question of first acquisition or origin is to be solved, for language as for tools, for arts, for family and social organization, and the rest. There is just as much and just as little reason for assuming miraculous interference and aid in one of these departments as in another. If men have been left to themselves to make and improve instruments, to form and perfect modes of social organization, by implanted powers directed by natural desires, and under the pressure of circumstances, then also to make and change the signs that constitute their speech. All expressions, as all instruments, are at present, and have been through the known past, made and changed by the men who use them; the same will have been the case in the unknown or prehistoric past. And we command now enough of the history of language, with the processes of its life and growth, to determine with confidence its mode of origin—within certain limits, as will appear below.

Cause of Language-making.

It is beyond all question, in the first place, that the desire of communication was the only force directly impelling men to the production of language. Man's sociality, his disposition to band together with his fellows, for lower and for higher purposes, for mutual help and for sympathy, is one of his most fundamental characteristics To understand those about one and to be understood by them is now, and must have been from the very beginning, a prime necessity of human existence; we cannot conceive of man, even in his most undeveloped state, as without the recognition of it. Communication is still the universally recognized office of speech, and to the immense majority of speakers the only one; the common man knows no other, and can only with difficulty and imperfectly be brought to see that there is any other; of the added distinctness and reach of mental action which the possession of such an instrumentality gives him he is wholly unconscious: and it is obvious that what the comparatively cultivated being of to-day can hardly be made to realize can never have acted upon the first men as a motive to action. It may perhaps be made a question which of the two uses of speech, communication or the facilitation of thought is the higher; there can be no question, at any rate, that the former is the broader and the more fundamental. That the kind and degree of thinking which we do nowadays would be impossible without language-signs is true enough; but so also it would be impossible without written signs. That there was a time when men had to do what mental work they could without the help of writing, as an art not yet devised, we have no difficulty in realizing, because the art is of comparatively recent device, and there are still communities enough that are working without it; it is much harder to realize that there was a time when speaking also was an art not yet attained, and that men had to carry on their rude and rudimentary thinking without it. Writing too was devised for conscious purposes of communication only; its esoteric uses, like those of speech, were at first unsuspected, and incapable of acting as an inducement; they were not noticed until made experience of, and then only by those who look beneath the surface of things. There is no analogy closer and more instructive than this between speech and writing. But analogies are abundant elsewhere in the history of human development. Everywhere it is the lower and more obvious inducements that are first effective, and that lead gradually to the possession of what serves and stimulates higher wants. All the arts and industries have grown out of men's effort to get enough to eat and protection against cold and heat—just as language, with all its uses, out of men's effort to communicate with their fellows. As a solitary man now would never form even the beginnings of speech, as one separated from society unlearns his speech by disuse and becomes virtually dumb, so early man, with all his powers, would never have acquired speech, save as to those powers was added sociality with the needs it brought. We might conceive of a solitary man as housing and dressing himself, devising rude tools, and thus lifting himself a step from wildness toward cultivation; but we cannot conceive of him as ever learning to talk. Recognition of the impulse to communication as the efficient cause of language-making is an element of primary importance in the theory of the origin of language. No one who either leaves it out of account or denies it will, however ingenious and entertaining his speculations, cast any real light on the earliest history of speech. To inquire under what peculiar circumstances, in connexion with what mode of individual or combined action, a first outburst of oral expression may have taken place, is, on

the other hand, quite futile. The needed circumstances were always present when human beings were in one another's society; there was an incessant drawing-on to attempts at mutual understanding which met with occasional, and then ever more frequent and complete success. There inheres in most reasoning upon this subject the rooted assumption, governing opinion even when not openly upheld or consciously made, that conceptions have real natural names, and that in a state of nature these will somehow break forth and reveal themselves under favouring circumstances. The falsity of such a view is shown by our whole further discussion.

Beginnings of Speech and Writing.

The character of the motive force to speech determined the character of the beginnings of speech. That was first signified which was most capable of intelligible signification, not that which was first in order of importance, as judged by any standard which we can apply to it, or first in order of conceptional development. All attempts to determine the first spoken signs by asking what should have most impressed the mind of primitive man are and must be failures. It was the exigencies and possibilities of practical life, in conditions quite out of reach of our distinct conception, that prescribed the earliest signs of communication. So, by a true and instructive analogy, the beginnings of writing are rude depictions of visible objects; it is now thoroughly recognized that no alphabet, of whatever present character, can have originated in any other way; everything else is gradually arrived at from that—as, indeed, in the ingeniously shaping hands of man, from any central body of signs, though but of small extent, all else is attainable by processes of analogy and adaptation and transfer. Now what is it that is directly signifiable in the world about us? Evidently the separate acts and qualities of sensible objects, and nothing else. In writing, or signification to the eye, the first element is the rude depiction of the outline of an object, or of that one of the sum of its characteristic qualities which the eye takes note of and the hand is capable of intelligibly reproducing; from that the mind understands the whole complex object itself, and then whatever further may in the circumstances of its use be suggested by it. So, for example, the picture of a tree signifies primarily a tree, then perhaps wood, something made of wood, and so on; that of a pair of outstretched wings signifies secondarily flight, then soaring, height, and whatever else these may lead to. No concrete thing is signifiable in its totality or otherwise than by a facile analysis of its constituent qualities and a selection of the one which is both sufficiently characteristic in itself and capable of being called up by a sign before the mind addressed.

Instrumentalities of Expression.

And what quality shall be selected depends in great measure upon the instrumentality used for its signification. Of such instrumentalities men possess a considerable variety. We must leave out of account that of depiction, as just instanced, because its employment belongs to a much more advanced state of cultivation, and leads the way to the invention not of speech but of the analogous and auxiliary art of writing. There remain gesture, or changes of position of the various parts of the body, especially of the most mobile parts, the arms and hands; grimace, or the changes of expression of the features of the countenance (in strictness, a variety of the preceding); and utterance, or the production of audible sound. It cannot be doubted that, in the first stages of communicative expression, all these three were used together, each for the particular purposes which it was best calculated to serve. The nearest approach to such action that is now possible is when two persons, wholly ignorant of one another's speech, meet and need to communicate—an imperfect correspondence, because each is trained to habits of expression and works consciously, and with the advantage of long experience, towards making himself understood; yet it is good for its main purpose. What they do, to reach mutual comprehension, is like what the first speechless men, unconsciously and infinitely more slowly, learned to do: face, hands, body, voice, are all put to use. It is altogether probable that gesture at first performed the principal part, even to such extent that the earliest human language may be said to have been a language of gesture signs; indeed, there exist at the present day such gesture-languages as those in use between roving tribes of different speech that from time to time meet one another (the most noted example is that of the gesture-language, of a very considerable degree of development, of the prairie tribes of American Indians); or such signs as are the natural resort of those who by deafness are cut off from ordinary spoken intercourse with their fellows. Yet there never can have been a stage or period in which all the three instrumentalities were not put to use together. In fact, they are still all used together; that is even now an ineffective speaking to which grimace and gesture ("action," as Demosthenes called them) are not added as enforcers; and the lower the grade of development and culture of a language, the more important, even for intelligibility, is their addition. But voice has won to itself the chief and almost exclusive part in communication, insomuch that we call all communication "language" (*i.e.* "tonguiness") just as a race of mutes might call it "handiness" and talk (by gesture) of a handiness of grimace. This is not in the least because of any closer connexion of the thinking apparatus with the muscles that act to produce audible sounds than with those that act to produce visible motions; not because there are natural uttered names for conceptions any more than natural gestured names. It is simply a case of "survival of the fittest," or analogous to the process by which iron has become the exclusive material of swords, and gold and silver of money: because, namely, experience has shown this to be the material best adapted to this special use. The advantages of voice are numerous and obvious. There is first its economy, as employing a mechanism that is available for little else, and leaving free for other purposes those indispensable instruments the hands. Then there is its superior perceptibleness: its nice differences impress themselves upon the sense at a distance at which visible motions become indistinct; they are not hidden by intervening objects; they allow the eyes of the listener as well as the hands of the speaker to be employed in other useful work; they are as plain in the dark as in the light; and they are able to catch and command the attention of one who is not to be reached in any other way. We might add as the third advantage a superior capability of variation and combination on the part of spoken sounds; but this is not to be insisted on, inasmuch as we hardly know what a gesture-language might have become if men's ingenuity in expression had been expended through all time upon its elaboration; and the superiority, however real, can hardly have been obvious enough to serve as a motive: certainly, there are spoken languages now existing whose abundance of resources falls short of what is attainable by gesture. Oral utterance is the form which expression has inevitably taken, the sum of man's endowments being what it is; but it would be a mistake to suppose that a necessity of any other kind is involved in their relation. The fundamental conditions of speech are man's grade of intellectual power and his social instinct; these being given, his expression follows, availing itself of what means it finds best suited to its purpose; if voice had been wanting it would have taken the next best. So, in certain well-known cases, a marked artistic gift on the part of individuals deprived of the use of hands has found means of exercise in the feet instead. But men in general have hands, instruments of exquisite tact and power, to serve the needs of their intellect; and so voice also, to provide and use the tools of thought; there is no error in maintaining that the voice is given us for speech, if only we do not proceed to draw from such a dictum false conclusions as to the relation between thought and utterance. Man is created with bodily instruments suited to do the work prescribed by his mental capacities; therein lies the harmony of his endowment.

The Voice.

Imitation.

It is through imitation that all signification becomes directly suggestive. The first written signs are (as already noticed) the depictions of visible objects, and could be nothing else; and, by the same necessity, the first uttered signs were the imitations of audible sounds. To reproduce

any sound of which the originating cause or the circumstances of production are known, brings up of course before the conception that sound, along with the originator, or circumstances of origination, or whatever else may be naturally associated with it. There are two special directions in which this mode of sign-making is fruitful: imitation of the sounds of external nature (as the cries of animals and the noises of inanimate objects when in motion or acted on by other objects) and imitation of human sounds. The two are essentially one in principle, although by some held apart, or even opposed to each other, as respectively the imitative or onomatopoetic and the exclamatory or interjectional beginnings of speech; they differ only in their spheres of significance, the one being especially suggestive of external objects, the other of inward feelings. There are natural human tones, indicative of feeling, as there are natural gestures, poses, modes of facial expression, which either are immediately intelligible to us (as is the warning cry of the hen to the day-old chicken), or have their value taught us by our earliest experiences. If we hear a cry of joy or a shriek of pain, a laugh or a groan, we need no explanation in words to tell us what it signifies any more than when we see a sad face or a drooping attitude. So also the characteristic cry or act of anything outside ourselves, if even rudely imitated, is to us an effective reminder and awakener of conception. We have no reason to question that such were the suggestions of the beginnings of uttered expression. The same means have made their contributions to language even down to our own day; we call words so produced "onomatopoetic" (*i.e.* "name-making"), after the example of the Greeks, who could not conceive that actually new additions to language should be made in any other way. What and how wide the range of the imitative principle, and what amount of language-signs it was capable of yielding, is a subject for special investigation—or rather, of speculation, since anything like exact knowledge in regard to it will never be attained; and the matter is one of altogether secondary consequence; it is sufficient for our purpose that enough could certainly be won in this way to serve as the effective germs of speech.

All the natural means of expression are still at our command, and are put to more or less use by us, and their products are as intelligible to us as they have been to any generation of our ancestors, back to the very first. They are analogous also to the means of communication of the lower animals; this, so far as we know, consists in observing and interpreting one another's movements and natural sounds (where there are such). But language is a step beyond this, and different from it. To make language, the intent to signify must be present. A cry wrung out by pain, or a laugh of amusement, though intelligible, is not language; either of them, if consciously reproduced in order to signify to another pain or pleasure, is language. So a cough within hearing of any one attracts his attention; but to cough, or to produce any other sound, articulate or inarticulate, for the purpose of attracting another's attention, is to commit an act of language-making, such as in human history preceded in abundance the establishment of definite traditional signs for conceptions. Here begins to appear the division between human language and all brute expression; since we do not know that any animal but man ever definitely took this step. It would be highly interesting to find out just how near any come to it; and to this point ought to be especially directed the attention of those who are investigating the communication of the lower animals in its relation to human communication. Among the animals of highest intelligence that associate with man and learn something of his ways, a certain amount of sign-making expressly for communication is not to be denied; the dog that barks at a door because he knows that somebody will come and let him in is an instance of it; perhaps, as well, the throwing out of sentinels from a flock, whose warning cry shall advertise their fellows of the threat of danger, is at least an approach to it as is anywhere made.

Language.

But the actual permanent beginnings of speech are only reached when the natural basis is still further abandoned, and signs begin to be used, not because their natural suggestiveness is seen in them, but by imitation, from the example of others who have been observed to use the same sign for the same purpose. Then for the first time the means of communication becomes something to be handed down, rather than made anew by each individual; it takes on that traditional character which is the essential character of all human institutions, which appears not less in the forms of social organization, the details of religious ceremonial, the methods of art and the arts, than in language. That all existing speech, and all known recorded speech, is purely traditional, cannot at all be questioned. It is proved even by the single fact that for any given conception there are as many different spoken signs as there are languages—say a thousand (this number is rather far within than beyond the truth), each of them intelligible to him who has learned to use it and to associate it with the conception to which it belongs, but unintelligible to the users of the nine hundred and ninety-nine other signs, as these are all unintelligible to him; unless, indeed, he learn a few of them also, even as at the beginning he learned the one that he calls his own. What single sign, and what set of signs, any individual shall use, depends upon the community into the midst of which he is cast, by birth or other circumstances, during his first years. That it does not depend upon his race is demonstrated by facts the most numerous and various; the African whose purity of descent is attested by every feature is found all over the world speaking just that language, or jargon, into the midst of which the fates of present or former slavery have brought his parents; every civilized community contains elements of various lineage, combined into one by unity of speech; and instances are frequent enough where whole nations speak a tongue of which their ancestors knew nothing; for example, the Celtic Gauls and the Germanic Normans of France speak the dialect of a geographically insignificant district in central Italy, while we ourselves can hardly utter a sentence or write a line without bringing in more or less of that same dialect. There is not an item of any tongue of which we know anything that *is* "natural" expression, or to the possession of which its speaker is brought by birth instead of by education; there is even very little that is traceably founded on such natural expression; everywhere θέσις or human attribution reigns supreme, and the original φύσις or natural significance has disappeared and is only to be found by theoretic induction (as we have found it above). It seems to some as if a name like *cuckoo* (one of the most striking available cases of onomatopoeia) were a "natural" one; but there is just as much θέσις in it as in any other name; it implies the observation of an aggregate of qualities in a certain bird, and the selection of one among them as the convenient basis of a mutual understanding when the bird is in question; every animal conspicuous to us must have its designation, won in one way or another; and in this case to imitate the characteristic cry is the most available way. If anything but convenience and availability were involved, all our names for animals would have to be and to remain imitations of the sounds they make. That the name of *cuckoo* is applied also to the female and young, and at other than the singing season, and then to related species which do not make the same sound—all helps to show the essentially conventional character of even this name. An analogous process of elimination of original meaning, and reduction to the value of conventional designation merely, is to be seen in every part of language throughout its whole history. Since men ceased to derive their names from signs having a natural suggestiveness, and began to make them from other names already in use with an understood value, every new name has had its etymology and its historical occasion—as, for example, the name *quarantine* from the two-score (*quarantaine*) of days of precautionary confinement, or *volume* from its being rolled up, or *book* from a beech-wood staff, or *copper* from Cyprus, or *lunacy* from a fancied influence of the moon, or *priest* from being an older (πρεσβύτερος) person, or *butterfly* from the butter-yellow colour of a certain

Language Conventional.

common species; every part of our language, as of every other, is full of such examples—but, when once the name is applied, it belongs to that to which it is applied, and no longer to its relatives by etymology; its origin is neglected, and its form may be gradually changed beyond recognition, or its meaning so far altered that comparison with the original shall seem a joke or an absurdity. This is a regular and essential part of the process of name-making in all human speech, and from the very beginning of the history of speech; in fact (as pointed out above), the latter can only be said to have begun when this process was successfully initiated, when uttered signs began to be, what they have ever since continued to be, conventional, or dependent only on a mutual understanding. Thus alone did language gain the capacity of unlimited growth and development. The sphere and scope of natural expression are narrowly bounded; but there is no end to the resources of conventional sign-making.

Brute Speech and Human Speech.

It is well to point out here that this change of the basis of men's communication from natural suggestiveness to mutual understanding, and the consequent purely conventional character of all human language, in its every part and particle, puts an absolute line of demarcation between the latter and the means of communication of all the lower animals. The two are not of the same kind, any more than human society in its variety of organization is of the same kind with the instinctive herding of wild cattle or swarming of insects, any more than human architecture with the instinctive burrowing of the fox and nest-building of the bird, any more than human industry and accumulation of capital with the instinctive hoarding of bees and beavers. In all these cases alike the action of men is a result of the adaptation of means at hand to the satisfaction of felt needs, or of purposes dimly perceived at first, but growing clearer with gradually acquired experience. Man is the only being that has established institutions—gradually accumulated and perfected results of the exercise of powers analogous in kind to, but greatly differing in degree from, those of the lower animals. The difference in degree of endowment does not constitute the difference in language, it only leads to it. There was a time when all existing human beings were as destitute of language as the dog; and that time would come again for any number of human beings who should be cut off (if that were practicable) from all instruction by their fellows: only they would at once proceed to recreate language, society and arts by the same steps by which their own remote ancestors created those which we now possess; while the dog would remain what he and his ancestors have always been, a creature of very superior intelligence, indeed, as compared with most, of infinite intelligence as compared with many, yet incapable of rising by the acquisition of culture through the formation and development of traditional institutions. There is just the same *saltus* existent in the difference between man's conventional speech and the natural communication of the lower races as in that between men's forms of society and the instinctive associations of the lower races; but it is no greater and no other; it is neither more absolute and characteristic nor more difficult to explain. Hence those who put forward language as *the* distinction between man and the lower animals, and those who look upon our language as the same in kind with the means of communication of the lower animals, only much more complete and perfect, fail alike to comprehend the true nature of language, and are alike wrong in their arguments and conclusions. No addition to or multiplication of brute speech would make anything like human speech; the two are separated by a step which no animal below man has ever taken; and, on the other hand, language is only the most conspicuous among those institutions the development of which has constituted human progress, while their possession constitutes human culture.

With the question of the origin of man, whether or not developed out of lower animal forms, intermediate to the anthropoid apes, language has nothing to do, nor can its study ever be made to contribute anything to the solution of that question. If there have existed creatures above the apes and below man, who were extirpated by primitive man as his especial rivals in the struggle for existence, or became extinct in any other way, there is no difficulty in supposing them to have possessed forms of speech, more rudimentary and imperfect than ours. At any rate, all existing human speech is one in the essential characteristics which we have thus far noted or shall hereafter have to consider, even as humanity is one in its distinction from the lower animals; the differences are in non-essentials. All speech is one in the sense that every human being, of whatever race he may be, is capable of acquiring any existing tongue, and of using it for the same purposes for which its present possessors use it, with such power and effect as his individual capacity allows, and without any essential change in the mental operations carried on by means of speech—even as he may acquire any other of the items of culture belonging to a race not his own.

Language and Culture.

The difference between employing one language and another is like that between employing one instrument and another in mechanical arts; one instrument may be better than another, and may enable its user to turn out better work, but the human ingenuity behind both is the same, and works in the same way. Nor has the making of language anything whatever to do with making man what he is, as an animal species having a certain physical form and intellectual endowment. Being what he is by nature, man has by the development of language and other institutions become what he is by culture. His acquired culture is the necessary result of his native endowment, not the contrary. The acquisition of the first stumbling beginnings of a superior means of communication had no more influence to raise him from a simian to a human being than the present high culture and perfected speech of certain races has to lift them up to something more than human and specifically different from the races of inferior culture. It cannot be too absolutely laid down that differences of language, down to the possession of language at all, are differences only in respect to education and culture.

Development of Language-signs.

How long man, after he came into such being as he now is, physically and intellectually, continued to communicate with imitative signs of direct significance, when the production of traditional signs began, how rapidly they were accumulated, and how long any traces of their imitative origin clave to them—these and the like questions it is at present idle to try to answer even conjecturally; just as it is to seek to determine when the first instruments were used, how soon they were shaped instead of being left crude, at what epoch fire was reduced to service, and so on. The stages of development and their succession are clear enough; to fix their chronology will doubtless never be found practicable. There is much reason for holding, as some do, that the very first items of culture were hardest to win and cost most time, the rate of accumulation (as in the case of capital) increasing with the amount accumulated. Beyond all reasonable question, however, there was a positively long period of purely imitative signs, and a longer one of mixed imitative and traditional ones, the latter gradually gaining upon the former, before the present condition of things was reached, when the production of new signs by imitation is only sporadic and of the utmost rarity, and all language-signs besides are traditional, their increase in any community being solely by variation and combination, and by borrowing from other communities.

The roots.

Of what nature, in various respects, this earliest language-material was is sufficiently clear. The signs, in the first place, were of the sort that we call "roots." By this is only meant that they were integral signs, significant in their entirety, not divisible into parts, of which one signified one thing and another another thing, or of which one gave the main significance, while another was an added sign of kind or relation. In a language of developed structure like our own, we arrive at such "roots" mainly by an artificial stripping-off of the signs of relation which almost every word still has, or can be shown to have once had. In *in-cost-li-ness*, for example, *cost* is the centrally significant element, so far as English is

concerned it is a root, about which cluster a whole body of forms and derivatives; if we could follow its history no farther it would be to us an ultimate root, as much so as *bind* or *sing* or *mean*. But we can follow it up, to the Latin compound *con-sta*, a root *sta* with a prefixed formative element *con*. Then *sta*, which in slightly varied forms we find in a whole body of related tongues called "Indo-European," having in them all the same significance "stand," is an Indo-European root, and to us an ultimate one, because we can follow its history no farther; but there always remains the possibility that it is as far from being actually original as is the English root *cost*: that is to say, it is not within our power ever to get back to the really primitive elements of speech and to demonstrate their character by positive evidence. The reason for accepting a primitive root-stage of language is in great part theoretical: because nothing else is reconcilable with any acceptable view of the origin of language. The law of the simplicity of beginnings is an absolute one for everything of the nature of an institution, for every gradually developed product of the exercise of human faculties. That an original speech-sign should be of double character, one part of it meaning this and another part that, or one part radical and the other formative, is as inconceivable as that the first instruments should have had handles, or the first shelters a front room and a back one. But this theoretical reason finds all the historical support which it needs in the fact that, through all the observable periods of language-history we see formative elements coming from words originally independent, and not from anything else. Thus, in the example just taken, the *-li-* of *costliness* is a suffix of so recent growth that its whole history is distinctly traceable; it is simply our adjective *like*, worn down in both form and meaning to a subordinate value in combination with certain words to which it was appended, and then added freely as a suffix to any word from which it was desired to make a derivative adjective—or, later but more often, a derivative adverb. The *ness* is much older (though only Germanic), and its history obscurer; it contains, in fact, two parts, neither of them of demonstrable origin; but there are equivalent later suffixes, as *ship* in *hardship* and *dom* in *wisdom*, whose derivation from independent words (*shape*, *doom*) is beyond question. The *un-* of *uncostliness* is still more ancient (being Indo-European), and its probably pronominal origin hardly available as an illustration; but the comparatively modern prefix *be-*, of *become*, *belie*, &c., comes from the independent preposition *by*; by the same process as *-ly* or *-li-* from *like*. And the *con* which has contributed its part to the making of the quasi-root *cost* is also in origin identical with the Latin preposition *cum*, "with." By all the known facts of later language-growth we are driven to the opinion that every formative element goes back to some previously existing independent word; and hence that in analysing our present words we are retracing the steps of an earlier synthesis, or following up the history of our formed words toward the unformed roots out of which they have grown. The doctrine of the historical growth of language-structure leads by a logical necessity to that of a root-stage in the history of all language; the only means of avoiding the latter is the assumption of a miraculous element in the former.

Earliest Phonetic Form.

Of what phonetic form were the earliest traditional speech-signs is, so far as essentials are concerned, to be inferred with reasonable certainty. They were doubtless articulate: that is to say, composed of alternating consonant and vowel sounds, like our present speech; and they probably contained a part of the same sounds which we now use. All human language is of this character; there are no sounds in any tongue which are not learned and reproduced as easily by children of one race as of another; all dialects admit a like phonetic analysis, and are representable by alphabetic signs; and the leading sounds, consonant and vowel, are even practically the same in all, though every dialect has its own (for the most part, readily definable and imitable) niceties of their pronunciation, while certain sounds are rare, or even met with only in a single group of languages or in a single language. Articulate sounds are such as are capable of being combined with others into that succession of distinct yet connectable syllables which is the characteristic of human speech-utterance. The name "articulate" belongs to this utterance, as distinguished from inarticulate human sounds and cries and from the sounds made by the lower animals. The word itself is Latin, by translation from the Greek, and, though very widely misunderstood, and even deliberately misapplied in some languages to designate all sound, of whatever kind, uttered by any living creature, is a most happily chosen and truly descriptive term. It signifies "jointed," or broken up into successive parts, like a limb or stem; the joints are the syllables; and the syllabic structure is mainly effected by the alternation of closer or consonant sounds with opener or vowel sounds. The simplest syllabic combination (as the facts of language show) is that of a single consonant with a following vowel; and there are languages even now existing which reject any other. Hence there is much plausibility in the view that the first speech-signs will have had this phonetic form and been monosyllabic, or dissyllabic only by repetition (reduplication) of one syllable, such as the speech of very young children shows to have a peculiar ease and naturalness. The point, however, is one of only secondary importance, and may be left to the further progress of phonetic study to settle, if it can; the root-theory, at any rate, is not bound to any definite form or extent of root, but only denies that there can have been any grammatical structure in language except by development in connexion with experience in the use of language. What particular sounds, and how many, made up the first spoken alphabet is also a matter of conjecture merely; they are likely to have been the closest consonants and the openest vowels, medial utterances being of later development.

Character of Early Speech.

As regards their significant value, the first language-signs must have denoted those physical acts and qualities which are directly apprehensible by the senses; both because these alone are directly signifiable, and because it was only they that untrained human beings had the power to deal with or the occasion to use. Such signs would then be applied to more intellectual uses as fast as there was occasion for it. The whole history of language, down to our own day, is full of examples of the reduction of physical terms and phrases to the expression of non-physical conceptions and relations; we can hardly write a line without giving illustrations of this kind of linguistic growth. So pervading is it, that we never regard ourselves as having read the history of any intellectual or moral term till we have traced it back to a physical origin. And we are still all the time drawing figurative comparisons between material and moral things and processes, and calling the latter by the names of the former. There has never been any difficulty in providing for new knowledge and more refined thought by putting to new uses the earlier and grosser materials of speech.

As a matter of course, whatever we now signify by our simple expressions for simple acts, wants, and the like, was intended to be signified through the first speech-signs by the users of them. But to us, with our elaborated apparatus of speech, the sentence, composed of subject and predicate, with a verb or special predicative word to signify the predication, is established as the norm of expression, and we regard everything else as an abbreviated sentence, or as involving a virtual sentence. With a view to this we must have "parts of speech": that is, words held apart in office from one another, each usable for such and such a purpose and no other, and answering a due variety of purposes, so that when they are combined they fit together, as parts composing a whole, and the desired meaning is made clear. Inflexions, too, lend their aid; or else auxiliary words of various kinds answering the same purpose—namely, of determining the relations of the members of the sentence. But all our success in understanding the earliest stages of language depends upon our power to conceive a state of things where none of these distinctions were established, where one speech-sign was like another, calling up a conception in its indefinite entirety, and leaving the circumstances of the case to limit its application.

Such a language is far below ours in explicitness; but it would suffice for a great deal of successful communication; indeed (as will be shown farther on) there are many languages even now in existence which are little better off. So a look of approval or disgust, a gesture of beckoning or repulsion, a grunt of assent or inquiry, is as significant as a sentence, means a sentence, is translatable into a sentence, and hence may even in a certain way be called a sentence; and in the same way, but only so, the original roots of language may be said to have been sentences. In point of fact, between the holophrastic gesture or uttered sign and the sentence which we can now substitute for it—for example between the sign of beckoning and the equivalent sentence, "I want you to come here"—lies the whole history of development of inflective speech.

Develop-ment of Language.

What has been this history of development, how the first scanty and formless signs have been changed into the immense variety and fullness of existing speech, it is of course impossible to point out in detail, or by demonstration of facts, because nearly the whole process is hidden in the darkness of an impenetrable past. The only way to cast any light upon it is by careful induction from the change and growth which are seen to have been going on in the recent periods for which we have recorded evidence, or which are going on at the present time. Of some groups of related languages we can read the life for three or four thousand years back, and by comparison can infer it much farther; and the knowledge thus won is what we have to apply to the explanation of periods and languages otherwise unknown. Nothing has a right to be admitted as a factor in language-growth of which the action is not demonstrable in recorded language. Our own family of languages is the one of whose development most is known, by observation and well-warranted inference; and it may be well here to sketch the most important features of its history, by way of general illustration.

In Indo-European Speech.

Apparently the earliest class-distinction traceable in Indo-European speech is that of pronominal roots, or signs of position, from the more general mass of roots. It is not a formal distinction, marked by a structural difference, but, so far as can be seen, is founded only on the assignment by usage of certain elements to certain offices. Formal distinction began with combination, the addition of one element to another, their fusion into a single word, and the reduction of the one part to a subordinate value, as sign of a certain modification of meaning of the other. Thus, doubtless by endings of pronominal origin, were made the first verb-forms, or words used only when predication was intended (since that is all that makes a verb), conveying at first a distinction of persons only, then of persons and numbers, while the further distinctions of tense and mode were by degrees added. To the nouns, which became nouns by the setting up of the separate and special class of verbs, were added in like manner distinctions of case, of number, and of gender. With the separation of noun and verb, and the establishment of their respective inflexion, the creative work of language-making is virtually done; the rest is a matter of differentiation of uses. For the noun (noun substantive) and the adjective (noun adjective) become two parts of speech only by a gradually deepened separation of uses; there is no original or formal distinction between them; the pronouns as a rule merely add the noun-inflexion to a special set of stems; adverbs are a part of the same formation as noun-cases; prepositions are adverbs with a specialized construction, of secondary growth; conjunctions are the products of a like specialization; articles, where found at all, are merely weakened demonstratives and numerals.

To the process of form-making, as exhibited in this history, belong two parts: the one external, consisting in the addition of one existing element of speech to another and their combination into a single word; the other internal, consisting in the adaptation of the compound to its special use and involving the subordination of one element to the other. Both parts appear also abundantly in other departments of language-change, and throughout the whole history of our language; nothing has to be assumed for the earliest formations which is not plainly illustrated in the latest. For example, the last important addition to the formative apparatus of English is the common adverb-making suffix *-ly*, coming, as already pointed out, from the independent adjective *like*. There was nothing at first to distinguish a compound like *godly* (*godlike*) from one like *storm-tossed*, save that the former was more adaptable than the other to wider uses; resemblance is an idea easily generalized into appurtenance and the like, and the conversion of *godlike* to *godly* is a simple result of the processes of phonetic change described farther on. The extension of the same element to combination with adjectives instead of nouns, and its conversion to adverb-making value, is a much more striking case of adaptation, and is nearly limited to English among the Germanic languages that have turned *like* into a suffix. A similar striking case of combination and adaptation is seen in the Romanic adverb-making suffix *mente* or *ment*, coming from the Latin ablative *mente*, "with mind." So, to make a Romanic future like *donnerai*, "I shall give," there was needed in the first place the pre-existing elements *donner*, "to give," and *ai*, "I have," and their combination; but this is only a part; the other indispensable part is the gradual adaptation of a phrase meaning "I have [something before me] for giving" to the expression of simple futurity, *donabo*. So far as the adaptation is concerned the case is quite parallel to that of *j'ai donné*, "I have given," &c. (equivalent phrases or combinations are found in many languages), where the expression of possession of something that is acted on has been in like manner modified into the expression of past action. Parallel in both combination and adaptation is the past tense *loved*, according to a widely accepted theory, from *love-did*, while we have again the same adaptation without combination in the equivalent phrase *did love*.

That these are examples of the process by which the whole inflective structure of Ind.-European language was built up admits of no reasonable question. Our belief that it is so rests upon the solid foundation that we can demonstrate no other process, and that this one is sufficient. It is true that we can prove such an origin for our formative elements in only a small minority of instances; but this is just what was to be expected, considering what we know of the disguising processes of language-growth. No one would guess in the mere *y* of *ably* (for *able-ly*) the presence of the adjective *like*, any more than in the altered final of *sent* and the shortened vowel of *led* the effect of a *did* once added to *send* and *lead*. The true history of these forms can be shown, because there happen to be other facts left in existence to show it; where such facts are not within reach we are left to infer by analogy from the known to the unknown. The validity of our inference can only be shaken by showing that there are forms incapable of having been made in this way, or that there are and have been other ways of making forms. Of the former there is evidently but small chance; if a noun-form meaning "with mind" can become the means of conversion of all the adjectives of a language into adverbs, and a verb meaning "have" (and, yet earlier, "seize") of signifying both future and past time, there is obviously nothing that is impossible of attainment by such means. As regards the latter, no [illegible] to have even attempted to demonstrate the genesis of [illegible] elements in any other way during [illegible]; it is simply assumed that the [illegible] will have [illegible] tancity [illegible] or forms [illegible] that [illegible] and [illegible] words [illegible] a [illegible] in some [illegible]. Such do[illegible] fanciful, and so opposed to [illegible]ings both of [illegible], and of sound theory that the epithet absurd is hardly too strong to apply to them. [illegible] developed intelligence, and trained in the [illegible] expression, can only win a new form by a long and gradual process of combination and adaptation, why should the [illegible] comparatively untrained generations have been able to do any

better? The advantage ought to be, if anywhere, on our side. The progress of language in every department, accompanying and representing the advance of the race, on the whole, in the art of speaking as in other arts, is from the grosser to the more refined, from the physical to the moral and intellectual, from the material to the formal. The conversion of compounds into forms, by the reduction of one of their elements to formative value, is simply a part of the general process which also creates auxiliaries and form-words and connectives, all the vocabulary of mind, and all the figurative phraseology that gives life and vigour to our speech. If a copula, expressive of the grammatical relation of predication, could be won only by attenuation of the meaning of verbs signifying "grow," "breathe," "stand," and the like; if our auxiliaries of tense and mode all go traceably back to words of physical meaning (as *have* to "seize," *may* to "be great or strong," *shall* to "be under penalty," and so on); if *of* comes from the comparatively physical *off*, and *for* from "*before*, *forward*"; if relative pronouns are specialized demonstratives and interrogatives; if *right* means etymologically "straight," and *wrong* means "twisted"; if *spirit* is "blowing," and *intellect* a "picking out among," and *understanding* a "getting beneath," and *development* an "unfolding"; if an event *takes place* or *comes to pass*, and then *drops out* of mind and is *forgotten* (opposite of *gotten*)—then it is of no avail to object to the grossness of any of the processes by which, in earlier language or in later, the expression of formal relations is won. The mental sense of the relation expressed is entirely superior to and independent of the means of its expression. He who, to express the plural of *man*, says what is equivalent to *man-man* or *heap-man* (devices which are met with in not a few languages) has just as good a sense of plurality as he who says *men* or *homines*; that sense is no more degraded in him by the coarseness of the phrase he uses to signify it than is our own sense of eventuality and of pastness by the undisguised coarseness of *take place* and *have been*. In short, it is to be laid down with the utmost distinctness and confidence, as a law of language-growth, that there is nothing formal anywhere in language which was not once material; that the formal is made out of the material, by processes which began in the earliest history of language and are still in action.

All formal Elements once Material.

We have dropped here the restriction to our own or Indo-European language with which we began, because it is evident that what is true of this family of speech, one of the most highly organized that exist, may also be true of the rest—must be true of them, unless some valid evidence be found to the contrary. The unity of human nature makes human speech alike in the character of its beginnings and in the general features of its after-history. Everywhere among men a certain store of expression, body of traditional signs of thought, being given, as used by a certain community, it is capable of increase on certain accordant lines, and only on them. In some languages, and under peculiar circumstances, borrowing is a great means of increase; but it is the most external and least organically important of all. Out-and-out invention (which, so far as we can see, must be of the kind called by us onomatopoetic) is found to play only a very insignificant part in the historical periods of language—clearly because there are other [illegible] of gaining new expression for what needs to be [illegible] the course of phonetic change a word sometimes [illegible] (or more) forms, and makes so many words, which are [illegible] turned to account. Everything beyond this [illegible] of combination; there is no other way, so far [illegible] the externals of speech. Then, partly as accom-[illegible] this external growth, partly as separate from [illegible] there is in all language an internal growth, making no appearance in the audible part of speech, consisting in multiplication of meanings, their modification in the way of precision or comprehension or correctness, the restriction of words to certain uses, and so on. Along with these, too, a constant change of phonetic form constitutes an inseparable part of the life of language. Speech is no more stable with respect to the sounds of which it is composed than with respect to its grammatical forms, its vocabulary, or the body of conceptions signified by it. Even nearly related languages differ as much in their spoken alphabets and the combinations of sounds they admit, and in their uttered forms of words historically the same, as in any other part; and the same is true of local dialects and of class dialects within the same community. Phonetic change has nothing whatever to do with change of meaning; the two are the product of wholly independent tendencies. Sometimes, indeed, they chance to coincide, as in the distinction of *minúte* "small," and *mínute* "moment"; but it is only by chance, as the spoken accordance of *second* in its two meanings ("next" and "sixtieth of a minute") shows; words that maintain their identity of value most obstinately, like the numerals, are liable to vary indefinitely in form (so *four*, *fidvor*, *quatuor*, *τέσσαρ-ες*, &c., from an original *kwetwor-*; *five*, *quinque*, *πέντε*, *coic*, &c., from *penkwe*—while, on the other hand, *two* and *three* show as striking an accordance of form as of meaning through all the same languages); what is far the most common is that the word becomes very unlike its former self in both respects, like *priest* from the Greek *πρεσβύτερος* (*presbyter*), literally "older man." Human convenience is, to be sure, the governing motive in both changes; but it is convenience of two different kinds: the one mental, depending on the fact (pointed out above) that a name when once applied belongs to the thing to which it is applied, to the disregard of its etymological connexions, does not need to be changed when the thing changes, and is ready for new application to anything that can be brought into one class with the latter; and the other physical, depending on the organs of speech and their successive movements, by which the sounds that make up the word are produced. Phonetic convenience is economy of effort on the part of those organs; and to no other law than that of economy of utterance have any of the phenomena of phonetic change been found traceable (though it is also to be noted that some phenomena have not hitherto been successfully brought under it, and that the way of effecting this is still unclear). "Euphony," which used to be appealed to as explanation, is a false principle, except so far as the term may be made an idealized synonym of economy. The ear finds that agreeable which the organs of utterance find facile. Economy in utterance is no isolated tendency; it is the same that plays its part in all other kinds of human action, and in language appears equally in the abbreviation of the sentence by leaving out parts that can be spared without loss of intelligibility. It is an insidious tendency, always lying in wait, like gravitation, to pull down what is not sufficiently held up—the holding-up force in language being the faithfulness of tradition, or accurate reproduction by the learner and user of the signs which he has acquired. No generation of men has any intention to speak otherwise than as its predecessor has spoken, or any consciousness that it is doing so; and yet, from generation to generation, words are shortened, sounds are assimilated to one another, and one element passes out of use while a new one is introduced. Abbreviation and assimilation are the most conspicuous departments of phonetic change, and those in which the nature of the governing tendency is most plainly seen. Taken by itself, one sound is as easy as another to the person who has accustomed himself to it from childhood; and those which the young child most easily acquires are not those which in the history of speech are least liable to alteration; it is especially in the combinations and transitions of rapid speaking that the tongue, as it were, finds out for itself easier ways of performing its task, by dropping and slurring and adapting. To trace out the infinitely varied items of this change, to co-ordinate and compare them, and discover their reasons, constitutes a special department of language-study, which is treated under the head of PHONETICS. It only needs to be pointed out here that phonetic change plays a necessary part in the structural development of language, by integrating compound words through fusion and loss of identity of their component parts, and, what is of yet more importance, by converting them into forms, through disguise of identity of one of the parts and its phonetic subordination to the other part. It is this that turns, for example, the compound *god-like* into

Laws of Change and Growth.

the derivative *godly*, the compound *love-did* into the verbal form *loved*. And yet one further result sometimes follows: an internal change is wrought by phonetic influence in the body of a word, which change then may in the further history of the word be left as the sole means of distinction between one form and another. It is thus that, in the most recent period, the distinction of *led* from *lead* and *met* from *meet* and so on has been made; the added auxiliary which originally made these preterites induced a shortening of the root-vowel, and this was left behind when the auxiliary disappeared by the usual process of abbreviation. It is in the same way that the distinctions of *men* from *man*, of *were* from *was*, of *set* from *sit*, with all their analogues, were brought about: by a modification of vowel-sound (Ger. *Umlaut*) occasioned by the presence in the following syllable of an *i*-vowel, which in the older stages of the language is still to be seen there. And the distinctions of *sing*, *sang*, *sung* and *song*, of *bind*, *bound*, *band* and *bond*, are certainly of the same kind, though they go back so far in the history of our family of languages that their beginnings are not yet clearly demonstrable; they were in their origin phonetic accidents, inorganic, mere accompaniments and results of external combinations which bore the office of distinction of meaning and were sufficient to it; in some of our languages they have been disregarded and effaced, in others they have risen to prominent importance. To regard these internal changes as primary and organic is parallel with assuming the primariness of the formative apparatus of language in general; like this, it ignores the positive evidence we have of the secondary production of such differences; they are, like everything else in linguistic structure, the outcome of combination and adaptation.

Borrowing, or the taking-in of material out of another language, has been more than once referred to above as sometimes an important element in language-history, though less deep-reaching and organic than the rest. There is nothing anomalous about borrowing; it is rather in essential accordance with the whole process of language-acquisition. All our names were adopted by us because they were already in use by others; and a community is in the same way capable of taking a new name from a community with which it comes in contact as an individual from individuals. Not that it seeks or admits in this way new names for old things; but it accepts new things along with the names that seem to belong to them. Hence any degree of intercourse between one community and another, leading to exchange of products or of knowledge, is sure to lead also to some borrowing of names; and there is hardly a language in the world, except of races occupying peculiarly isolated positions, that does not contain a certain amount of foreign material thus won, even as our English has elements in its vocabulary from half the other tongues in the world. The scale of borrowing is greatly increased when one people becomes the pupil of another in respect of its civilization: hence the abundant classical elements in all the European tongues, even the non-Romanic; hence the Arabic material in Persian and Turkish and Malay; hence the Chinese in Japanese and Corean; and, as a further result, even dead languages, like the Greek and Latin and the Sanskrit, become stores to be drawn upon in that learned and conscious quest of new expression which in the school-stage of culture supplements or even in a measure replaces the unconscious growth of natural speech. So, in mixture of communities, which is a highly-intensified form of contact and intercourse, there follows such mixture of speech as the conditions of the case determine; yet not a mixture on equal terms, through all the departments of vocabulary and grammar; the resulting speech (just as when two individuals learn to speak alike) is essentially that of the one constituent of the new community, with more or less material borrowed from that of the other. What is most easily taken in out of another language is the names of concrete things; every degree of removal [illegible]is involves additional difficulty—names of abstract [illegible]thets, verbs, connectives, forms. Indeed, the borrow[illegible]s in the highest sense, or forms of inflexion, is well-[illegible]ite impossible; no example of it has been demonstrated [illegible] the historical periods of language, though it is sometimes adventurously assumed as a part of prehistoric growth. How nearly it may be approached is instanced by the presence in English of such learned plurals as *phenomena* and *strata*. This extreme resistance to mixture in the department of inflexion is the ground on which some deny the possibility of mixture in language, and hence the existence of such a thing as a mixed language. The difference is mainly a verbal one; but it would seem about as reasonable to deny that a region is inundated so long as the tops of its highest mountains are above water. According to the simple and natural meaning of the term, nearly all languages are mixed, in varying degree and within varying limits, which the circumstances of each case must explain.

These are the leading processes of change seen at work in all present speech and in all known past speech, and hence to be regarded as having worked through the whole history of speech. By their operation every existing tongue has been developed out of its rudimentary radical condition to that in which we now see it. The variety of existing languages is wellnigh infinite, not only in their material but in their degree of development and the kind of resulting structure. Just as the earlier stages in the history of the use of tools are exemplified even at the present day by races which have never advanced beyond them, so is it in regard to language also—and, of course, in the latter case as in the former, this state of things strengthens and establishes the theory of a gradual development. There is not an element of linguistic structure possessed by some languages which is not wanting in others; and there are even tongues which have no formal structure, and which cannot be shown ever to have advanced out of the radical stage. The most noted example of such a rudimentary tongue is the Chinese, which in its present condition lacks all formal distinction of the parts of speech, all inflexion, all derivation; each of its words (all of them monosyllables) is an integral sign, not divisible into parts of separate significance; and each in general is usable wherever the radical idea is wanted, with the value of one part of speech or another, as determined by the connexion in which it stands; a condition parallel with that in which Indo-European speech may be regarded as existing prior to the beginnings of its career of formal development briefly sketched above. And there are other tongues, related and unrelated to Chinese, of which the same description, or one nearly like it, might be given. To call such languages radical is by no means to maintain that they exhibit the primal roots of human speech, unchanged or only phonetically changed, or that they have known nothing of the combination of element with element. Of some of them the roots are in greater or less part dissyllabic; and we do not yet know that all dissyllabism, and even that all complexity of syllable beyond a single consonant with following vowel, is not the result of combination or reduplication. But all combination is not form-making; it needs a whole class of combinations, with a recognized common element in them producing a recognized common modification of meaning, to make a form. The same elements which (in Latin, and even to some extent in English also) are of formal value in *con-stant* and *pre-dict* lack that character in *cost* and *preach*; the same *like* which makes adverbs in *tru-ly* and *right-ly* is present without any such value in *such* and *which* (from *so-like* and *who-like*); *cost* and *preach*, and *such* and *which*, are as purely radical in English as other words of which we do not happen to be able to demonstrate the composite character. And so a Chinese monosyllable or an Egyptian or Polynesian dissyllable is radical, unless there can be demonstrated in some part of it a formative value; and a language wholly composed of such words is a root-language. Recent investigation goes to show that Chinese had at some period of its history a formal development, since extinguished by the same processes of phonetic decay which in English have wiped out so many signs of a formal character and brought back so considerable a part of the vocabulary to monosyllabism. In languages thus constituted the only possible external alteration is that phonetic change to which all human speech, from the

Borrowing or Mixing.

Isolating Languages.

very beginning of its traditional life, is liable; the only growth is internal, by that multiplication and adaptation and improvement of meanings which is equally an inseparable part of all language-history. This may include the reduction of certain elements to the value of auxiliaries, particles, form-words, such as play an important part in analytical tongues like English, and are perhaps also instanced in prehistoric Indo-European speech by the class of pronominal roots. Phrases take the place of compounds and of inflexions, and the same element may have an auxiliary value in certain connexions while retaining its full force in others, like, for instance, our own *have*. It is not easy to define the distinction between such phrase-collocations and the beginnings of agglutination; yet the distinction itself is in general clearly enough to be drawn (like that in French between *donnerai* and *ai donné*) when the whole habit of the language is well understood.

Agglutinative Languages. Such languages, constituting the small minority of human tongues, are wont to be called "isolating," *i.e.* using each element by itself, in its integral form. All besides are "agglutinative," or more or less compounded into words containing a formal part, an indicator of class-value. Here the differences, in kind and degree, are very great; the variety ranges from a scantiness hardly superior to Chinese isolation up to an intricacy compared with which Indo-European structure is hardly fuller than Chinese. Some brief characterization of the various families of language in this respect will be given farther on, in connexion with their classification. The attempt is also made to classify the great mass of agglutinating tongues under different heads: those are ranked as simply "agglutinative" in which there is a general conservation of the separate identity of root or stem on the one hand, and of formative element, suffix or prefix, on the other; while the name "inflective," used in a higher and pregnant sense, is given to those that admit a superior fusion and integration of the two parts, to the disguise and loss of separate identity, and, yet more, with the development of an internal change as auxiliary to or as substitute for the original agglutination. But there is no term in linguistic science so uncertain of meaning, so arbitrary of application, so dependent on the idiosyncrasy of its user, as the term "inflective." Any language ought to have the right to be called inflective that has inflexion: that is, that not merely distinguishes parts of speech and roots and stems formally from one another, but also conjugates its verbs and declines its nouns; and the name is sometimes so used. If, again, it be strictly limited to signify the possession of *inner flexion* of roots and stems (as if simply agglutinated forms could be called "exflective"), it marks only a difference of degree of agglutination, and should be carefully used as so doing. As describing the fundamental and predominant character of language-structure, it belongs to only one family of languages, the Semitic, where most of the work of grammatical distinction is done by internal changes of vowel, the origin of which thus far eludes all attempts at explanation. By perhaps the majority of students of language it is, as a generally descriptive title, restricted to that family and one other, the Indo-European or Indo-Germanic; but such a classification is not to be approved, for, in respect to this characteristic, Indo-European speech ranks not with Semitic but with the great body of agglutinative tongues. To few of these can the name be altogether denied, since there is hardly a body of related dialects in existence that does not exhibit some items of "inflective" structure; the Aryan is only the one among them that has most to show. Outside the Semitic, at any rate, one should not speak of inflective and non-inflective languages, but only of languages more inflective and less inflective.

Inflective.

Value of Structure. To account for the great and striking differences of structure among human languages is beyond the power of the linguistic student, and will doubtless always continue so. We are not likely to be able even to demonstrate a correlation of capacities, saying that a race which has done this and that in other departments of human activity might have been expected to form such and such a language. Every tongue represents the general outcome of the capacity of a race as exerted in this particular direction, under the influence of historical circumstances which we can have no hope of tracing. There are striking apparent anomalies to be noted. The Chinese and the Egyptians have shown themselves to be among the most gifted races the earth has known; but the Chinese tongue is of unsurpassed jejuneness, and the Egyptian, in point of structure, little better, while among the wild tribes of Africa and America we find tongues of every grade, up to a high one, or to the highest. This shows clearly enough that mental power is not measured by language-structure. But any other linguistic test would prove equally insufficient. On the whole, the value and rank of a language are determined by what its users have made it do. The reflex action of its speech on the mind and culture of a people is a theme of high interest, but of extreme difficulty, and apt to lead its investigators away into empty declamation; taking everything together, its amount, as is shown by the instances already referred to, is but small. The question is simply one of the facilitation of work by the use of one set of tools rather than another; and a poor tool in skilful hands can do vastly better work than the best tool in unskilful hands—even as the ancient Egyptians, without steel or steam, turned out products which, both for colossal grandeur and for exquisite finish, are the despair of modern engineers and artists. In such a history of development as that of human speech a fortunate turn may lead to results of unforeseen value; the earlier steps determine the later in a degree quite beyond their own intrinsic importance. Everything in language depends upon habit and analogy; and the formation of habit is a slow process, while the habit once formed exercises a constraining as well as a guiding influence. Hence the persistency of language-structure: when a certain sum and kind of expression is produced, and made to answer the purposes of expression, it remains the same by inertia; a shift of direction becomes of extreme difficulty. No other reason can at present be given why in historical time there has been no marked development out of one grade of structure into another; but the fact no more shakes the linguistic scholar's belief in the growth of structure than the absence of new animal species worked out under his eyes shakes the confidence of the believer in animal development. The modifying causes and their modes of action are clearly seen, and there is no limit to the results of their action except what is imposed by circumstances.

Unity of Origin of Speech. It is in vain to attempt to use dates in language-history, to say when this or that step in development was taken, and how long a period it cost, especially now that the changed views as to the antiquity of man are making it probable that only a small part of the whole history is brought within the reach even of our deductions from the most ancient recorded dialects. At any rate, for aught that we know or have reason to believe, all existing dialects are equally old; every one alike has the whole immeasurable past of language-life behind it, has reached its present condition by advance along its own line of growth and change from the first beginnings of human expression. Many of these separate lines we clearly see to converge and unite, as we follow them back into the past; but whether they all ultimately converge to one point is a question quite beyond our power to answer. If in this immensity of time many languages have won so little, if everywhere language-growth has been so slow, then we can only differ as to whether it is reasonably certain, or probable, or only possible, that there should have been a considerable first period of human existence without traditional speech, and a yet more considerable one before the fixation of so much as should leave abiding traces in its descendants, and that meanwhile the race should have multiplied and scattered into independent communities. And the mere possibility is enough to exclude all dogmatic assertion of the unity of origin of human speech, even assuming unity of origin of the human race. For to prove that identity by the still existing facts of language is utterly out of the question;

the metamorphosing effect of constant change has been too great to allow it. In point of fact, taking languages as they now exist, only those have been shown related which possess a common structure, or have together grown out of the more primitive radical stage, since structure proves itself a more constant and reliable evidence than material. And this is likely ever to be the case; at any rate, to trace all the world's languages so far back toward their beginnings as to find in them evidences of identity is beyond the wildest hope. We must be content with demonstrating for those beginnings a unity of kind as alike a body of formless roots. But, on the other hand, since this unity is really demonstrated, since all structure is the result of growth, and no degree of difference of structure, any more than of difference of material, refuses explanation as the result of discordant growth from identical beginnings, it is equally inadmissible to claim that the diversities of language prove it to have had different beginnings. That is to say, the question of the unity of speech, and yet more that of the unity of the race, is beyond the reach of the student of language; the best view he can attain is the hypothetical one, that, if the race is one, the beginnings of speech were perhaps one—but probably not, even then. This negative conclusion is so clearly established as to leave no excuse for the still oft-repeated attempts to press language into service on either side of the controversy respecting human unity of race.

Unconscious Growth through Individuals. That all making and changing of language is by the act of its speakers is too obvious to call for discussion. No other force capable of acting and of producing effects is either demonstrable or conceivable as concerned in the work. The doctrine that language is an organism, growing by its own inherent powers, exempt from the interference of those who use it, is simply an indefensible paradox. Every word that is uttered is so by an act of human will, at first in imitation of others, then more and more by a formed and controlling habit; it is accessible to no change except by influences working in the speaker's mind and leading him to make it otherwise. Not that he is aware of this, or directs his action knowingly to that end. The whole process is unconscious. If any implication of reflective or intended action can be shown to inhere in any doctrine of linguistic science, it vitiates that doctrine. The attitude of the ordinary speaker towards his language is that of unreasoning acceptance; it seems to him that his names for things are their real names, and all others unintelligent nicknames; he thinks himself to possess his speech by the same tenure as his sight or hearing; it is "natural" to him (or, if he reasons about it, he attributes it to a divine origin, as races beginning to philosophize are wont to ascribe their various social institutions to their gods); he knows nothing of its structure and relations; it never occurs to him to find fault with it, or to deem it insufficient and add to or change it; he is wholly unaware that it does change. He simply satisfies his social needs of communication by means of it; and if he has anything to express that is different from what has been expressed before, he takes the shortest way to a provision for the need; while any relaxation of the energy of utterance tends to a variation in the uttered combinations; and thus changes come by his act, though without his knowledge. His sole object is, on the basis of what language he has, to make known his thought in the most convenient way to his fellow; everything else follows with and from that. Human nature and circumstances being what they are, what follows actually is, as already shown, incessant growth and change. For it we have not to seek special disturbing causes in the history of the speakers, although such may come in to heighten and quicken the change; we know that even in a small community, on a narrow islet, cut off from all intercourse with other communities, the speech would grow different—as certainly, if not as rapidly, as anywhere in the world—and only by the action of its speakers: not that the speakers of a language act in unison and simultaneously to produce a given change. This must begin in an individual, or more or less accordantly in a limited number of individuals, and spread from such example through the community. Initiation by one or a few, acceptance and adoption by the rest—such is the necessary method of all linguistic change, and to be read as plainly in the facts of change now going on among ourselves as in those of former language. The doctrine of the inaccessibility of language to other action than that of its speakers does not imply a power in the individual speaker to create or alter anything in the common speech, any more than it implies his desire to do so. What he suggests by his example must be approved by the imitation of his fellows, in order to become language. The common speech is the common property, and no one person has any more power over it than another. If there are, for example, a thousand speakers of a certain dialect, each one wields in general a thousandth part of the force required to change it—with just so much more as may belong to his excess of influence over his fellows, due to recognized superiority of any kind on his part. His action is limited only by their assent; but this is in effect a very narrow limitation, ensuring the adoption of nothing that is not in near accordance with the already existing; though it is also to be noted that he is as little apt to strike off into startling change as they to allow it; since the governing power of already formed habits of speech is as strong in him as in them. That change to which the existing habits naturally lead is easy to bring about; any other is practically impossible. It is this tendency on the part of the collective speakers of a language to approve or reject a proposed change according to its conformity with their already subsisting usages that we are accustomed to call by the fanciful name "the genius of a language."

Dialectic Variation. On the relation of the part played in language-change by the individual to that by the community, in combination with the inevitableness of change, rests the explanation of the dialectic variation of language. If language were stable there would of course be no divarication; but since it is always varying, and by items of difference that proceed from individuals and become general by diffusion, there can be uniformity of change only so far as diffusion goes or as the influences of communication extend. Within the limits of a single community, small or large, whatever change arises spreads gradually to all, and so becomes part of the general speech; but let that community become divided into two (or more) parts, and then the changes arising in either part do not spread to the other, and there begins to appear a difference in linguistic usage between them. It is at first slight, even to insignificance; not greater than exists between the dialects of different localities or ranks or occupations in the same community, without detriment to the general unity of speech. This unity, namely, rests solely on mutual intelligibility, and is compatible with no small amount of individual and class difference, in vocabulary, in grammar and in pronunciation; indeed, in the strictest sense, each individual has a dialect of his own, different from that of every other, even as he has a handwriting, a countenance, a character of his own. And every item of change, as it takes place, must have its season of existence as a local or class or trade peculiarity, before it gains universal currency; some of them linger long in that condition, or never emerge from it. All these differences in the speech of different sub-communities within the same community are essentially dialectic; they differ not in kind, but only in degree, from those which separate the best-marked dialects; they are kept down by general communication within the limit of general mutual intelligibility. Where that restraining influence ceases the limit is gradually but surely overpassed, and real dialects are the result. From what we know of the life of language we can say positively that continued uniformity of speech without continued community is not practicable. If it were possible to divide artificially, by an impassable chasm or wall, a people one for ages, and continuing to occupy the same seats, the language of the divided parts would at once begin to be dialectically different; and after sufficient time had elapsed each would have become unintelligible to the other. That is to say, whenever a community of uniform speech breaks up, its speech breaks

very beginning of its traditional life, is liable; the only growth is internal, by that multiplication and adaptation and improvement of meanings which is equally an inseparable part of all language-history. This may include the reduction of certain elements to the value of auxiliaries, particles, form-words, such as play an important part in analytical tongues like English, and are perhaps also instanced in prehistoric Indo-European speech by the class of pronominal roots. Phrases take the place of compounds and of inflexions, and the same element may have an auxillary value in certain connexions while retaining its full force in others, like, for instance, our own *have*. It is not easy to define the distinction between such phrase-collocations and the beginnings of agglutination; yet the distinction itself is in general clearly enough to be drawn (like that in French between *donnerai* and *ai donné*) when the whole habit of the language is well understood.

Such languages, constituting the small minority of human tongues, are wont to be called "isolating," *i.e.* using each element by itself, in its integral form. All besides are "agglutinative," or more or less compounded into words containing a formal part, an indicator of class-value. Here the differences, in kind and degree, are very great; the variety ranges from a scantiness hardly superior to Chinese isolation up to an intricacy compared with which Indo-European structure is hardly fuller than Chinese. Some brief characterization of the various families of language in this respect will be given farther on, in connexion with their classification. The attempt is also made to classify the great mass of agglutinating tongues under different heads: those are ranked as simply "agglutinative" in which there is a general conservation of the separate identity of root or stem on the one hand, and of formative element, suffix or prefix, on the other; while the name "inflective," used in a higher and pregnant sense, is given to those that admit a superior fusion and integration of the two parts, to the disguise and loss of separate identity, and, yet more, with the development of an internal change as auxiliary to or as substitute for the original agglutination. But there is no term in linguistic science so uncertain of meaning, so arbitrary of application, so dependent on the idiosyncrasy of its user, as the term "inflective." Any language ought to have the right to be called inflective that has inflexion: that is, that not merely distinguishes parts of speech and roots and stems formally from one another, but also conjugates its verbs and declines its nouns; and the name is sometimes so used. If, again, it be strictly limited to signify the possession of *inner flexion* of roots and stems (as if simply agglutinated forms could be called "exflective"), it marks only a difference of degree of agglutination, and should be carefully used as so doing. As describing the fundamental and predominant character of language-structure, it belongs to only one family of languages, the Semitic, where most of the work of grammatical distinction is done by internal changes of vowel, the origin of which thus far eludes all attempts at explanation. By perhaps the majority of students of language it is, as a generally descriptive title, restricted to that family and one other, the Indo-European or Indo-Germanic; but such a classification is not to be approved, for, in respect to this characteristic, Indo-European speech ranks not with Semitic but with the great body of agglutinative tongues. To few of these can the name be altogether denied, since there is hardly a body of related dialects in existence that does not exhibit some items of "inflective" structure; the Aryan is only the one among them that has most to show. Outside the Semitic, at any rate, one should not speak of inflective and non-inflective languages, but only of languages more inflective and less inflective.

Agglutinative Languages.

Inflective.

To account for the great and striking differences of structure among human languages is beyond the power of the linguistic student, and will doubtless always continue so. We are not likely to be able even to demonstrate a correlation of capacities, saying that a race which has done this and that in other departments of human activity might have been expected to form such and such a language.

Value of Structure.

Every tongue represents the general outcome of the capacity of a race as exerted in this particular direction, under the influence of historical circumstances which we can have no hope of tracing. There are striking apparent anomalies to be noted. The Chinese and the Egyptians have shown themselves to be among the most gifted races the earth has known; but the Chinese tongue is of unsurpassed jejuneness, and the Egyptian, in point of structure, little better, while among the wild tribes of Africa and America we find tongues of every grade, up to a high one, or to the highest. This shows clearly enough that mental power is not measured by language-structure. But any other linguistic test would prove equally insufficient. On the whole, the value and rank of a language are determined by what its users have made it do. The reflex action of its speech on the mind and culture of a people is a theme of high interest, but of extreme difficulty, and apt to lead its investigators away into empty declamation; taking everything together, its amount, as is shown by the instances already referred to, is but small. The question is simply one of the facilitation of work by the use of one set of tools rather than another; and a poor tool in skilful hands can do vastly better work than the best tool in unskilful hands—even as the ancient Egyptians, without steel or steam, turned out products which, both for colossal grandeur and for exquisite finish, are the despair of modern engineers and artists. In such a history of development as that of human speech a fortunate turn may lead to results of unforeseen value; the earlier steps determine the later in a degree quite beyond their own intrinsic importance. Everything in language depends upon habit and analogy; and the formation of habit is a slow process, while the habit once formed exercises a constraining as well as a guiding influence. Hence the persistency of language-structure: when a certain sum and kind of expression is produced, and made to answer the purposes of expression, it remains the same by inertia; a shift of direction becomes of extreme difficulty. No other reason can at present be given why in historical time there has been no marked development out of one grade of structure into another; but the fact no more shakes the linguistic scholar's belief in the growth of structure than the absence of new animal species worked out under his eyes shakes the confidence of the believer in animal development. The modifying causes and their modes of action are clearly seen, and there is no limit to the results of their action except what is imposed by circumstances.

It is in vain to attempt to use dates in language-history, to say when this or that step in development was taken, and how long a period it cost, especially now that the changed views as to the antiquity of man are making it probable that only a small part of the whole history is brought within the reach even of our deductions from the most ancient recorded dialects. At any rate, for aught that we know or have reason to believe, all existing dialects are equally old; every one alike has the whole immeasurable past of language-life behind it, has reached its present condition by advance along its own line of growth and change from the first beginnings of human expression. Many of these separate lines we clearly see to converge and unite, as we follow them back into the past; but whether they all ultimately converge to one point is a question quite beyond our power to answer. If in this immensity of time many languages have won so little, if everywhere language-growth has been so slow, then we can only differ as to whether it is reasonably certain, or probable, or only possible, that there should have been a considerable first period of human existence without traditional speech, and a yet more considerable one before the fixation of so much as should leave abiding traces in its descendants, and that meanwhile the race should have multiplied and scattered into independent communities. And the mere possibility is enough to exclude all dogmatic assertion of the unity of origin of human speech, even assuming unity of origin of the human race. For to prove that identity by the still existing facts of language is utterly out of the question;

Unity of Origin of Speech.

preponderance. Thus, there is left in French only an insignificant trace of the Celtic dialects of the predominant race-constituent of the French people; French is the speech of the Latin conquerors of Gaul, mixed perceptibly with that of its later Frankish conquerors; it was adopted in its integrity by the Norse conquerors of a part of the land, then brought into Britain by the same Norsemen in the course of their further conquests, this time only as an element of mixture, and thence carried with English speech to America, to be the language of a still further mixed community. Almost every possible phase of language-mixture is traceable in the history of the abundant words of Latin origin used by American negroes. What events of this character took place in prehistoric time we shall never be able to tell. If any one chooses to assert the possibility that even the completely isolated dialect of the little Basque community may have been derived by the Iberian race from an intrusive minority as small as that which made the Celts of Gaul speakers of Latin, we should have to admit it as a possibility—yet without detriment to the value of the dialect as indicating the isolated race-position of its speakers. In strictness, language is never a proof of race, either in an individual or in a community; it is only a probable indication of race, in the absence of more authoritative opposing indications; it is one evidence, to be combined with others, in the approach towards a solution of the confessedly insoluble problems of human history. But we must notice, as a most important circumstance, that its degree of probability is greatest where its aid is most needed, in prehistoric periods and among uncultivated races; since it is mainly civilization that gives to language a propagative force disproportionate to the number of its speakers. On the whole, the contributions of language to ethnology are practically far greater in amount and more distinct than those derived from any other source.

Classification.

The genetical classification of languages, then, is to be taken for just what it attempts to be, and no more: primarily as a classification of languages only; but secondarily as casting light, in varying manner and degree, on movements of community, which in their turn depend more or less upon movements of races. It is what the fates of men have left to represent the tongues of men—a record imperfect even to fragmentariness. Many a family once as important as some of those here set down has perhaps been wiped out of existence, or is left only in an inconspicuous fragment; one and another has perhaps been extended far beyond the limits of the race that shaped it—which, we can never tell to our satisfaction.

1. *Indo-European* (*Indo-Germanic*) *Family.*—To this family belongs incontestably the first place, and for many reasons: the historical position of the peoples speaking its dialects, who have now long been the leaders in the world's history; the abundance and variety and merit of its literatures, ancient and modern, which, especially the modern, are wholly unapproached by those of any other division of mankind; the period covered by its records; and, most of all, the great variety and richness of its development. These advantages make of it an illustration of the history of human speech with which no other family can bear a moment's comparison as to value, however important various other families may be in their bearing on one and another point or department of history, and however necessary the combination of the testimony of all to a solution of the problems involved in speech. These advantages have made Indo-European language the training-ground of comparative philology, and its study will always remain the leading branch of that science. Many matters of importance in its history have been brought up and used as illustrations in the preceding discussion; but as its constitution and ascertained development call for a fuller and more systematic exposition than they have found here, a special section is devoted to the subject (see Part II. below; also Indo-European Language).

2. *Semitic Family.*—This family also is beyond all question the second in importance, on account of the part which its peoples (Hebrews, Phoenicians, Assyrians, Syrians, Arabs, Abyssinians, &c.) have played in history, and of the rank of its literatures. For a special treatment of it see Semitic Languages. Some of the peculiarities of the language have been alluded to above; in the monotony and rigidity of its triliteral roots, and in the extended use which it makes of internal vowel-change ("inflexion" in the special sense of that term) for the purposes of grammatical distinction, it is more peculiar and unlike all the other known families of language than these are unlike one another. There are, and perhaps will always be, those to whom the peculiarities just mentioned will seem original; but if the views of language and its history taken above are in the main true, then that opinion is untenable; Semitic language must have grown into its present forms out of beginnings accordant in kind, if not identical in substance, with those of other families; and the only question remaining to be solved is, through what processes and under what governing tendencies Semitic speech should have arrived at its present state. And with this solution is most obviously and incontestably bound up that of the other interesting and much discussed question, whether the Semitic family can be shown to be related with other families, especially with the Indo-European. To some the possession in common of grammatical gender, or of the classification of objects in general as masculine and feminine, is of itself enough to prove such relationship; but, though the fact is a striking one, and of no small importance as an indication, this degree of value can by no means be attributed to it in the present state of our knowledge—any more than to any other single item of structure among the infinite variety of such, distributed among the multitude of human tongues. Many others compare the Semitic and Indo-European "roots" with one another, and believe themselves to find there numerous indications of identity of material and signification; but these also must pass for insufficient, until it shall prove possible by their aid to work out an acceptable theory of how Semitic structure should have grown out of such radical elements as underlie Indo-European structure, or out of the accordant initial products of a structural growth that afterwards diverged into two so discordant forms. To show that, both the material and the method have been hitherto wanting, and any confident decision is at least premature; but present probabilities are strongly against the solubility of the question. While many general considerations favour the ultimate unity of these two great civilized and civilizing white races of neighbouring homes, and no discordance of speech (as was shown above) can ever be made to prove their diversity of origin, it seems in a high degree unlikely that the evidence of speech will ever be made to prove them one.

3. *Hamitic Family.*—The prominent importance of this family (see Hamitic Languages) is due to a single one of its members, the Egyptian. It occupies the north-eastern corner of Africa, with the border-lands of that continent stretching westward along the whole shore of the Mediterranean, and southward to beyond the equator. It falls into three principal divisions: (1) the ancient Egyptian, with its descendant, the more modern Coptic (itself now for some centuries extinct; see Egypt, Copts); (2) the Libyan or Berber languages of northern Africa; (3) the Ethiopic languages of eastern Africa. Its situation thus plainly suggests the theory of its intrusion from Asia, across the isthmus of Suez, and its gradual spread from that point; and the theory is strongly favoured by the physical character of the Hamites, and the historical position, especially of the Egyptians, so strikingly different from that of the African races in general. Linguistic evidences of the relationship of Hamite with Semite have also been sought, and by many believed to be found; but the maintenance of the two families in their separateness is an indication that those evidences have not yet been accepted as satisfactory; and such is indeed the case. The Egyptian is a language of extreme simplicity of structure, almost of no structure at all. Its radical words are partly monosyllabic, partly of more than one syllable, but not in the latter case any more than in the former showing traceable signs of extension by formative processes from simpler

elements. It has no derivative apparatus by which noun-stems are made from roots; the root is the stem likewise; there is nothing that can be properly called either declension or conjugation; and the same pronominal particles or suffixes have now a subjective value, indicating use as a verb, and now a possessive, indicating use as a noun. There is no method known to linguistic science by which the relationship of such a tongue as this with the highly and peculiarly inflective Semitic can be shown, short of a thorough working out of the history of development of each family taken by itself, and a retracing in some measure of the steps by which each should have arrived at its present position from a common starting-point; and this has by no means been done. In short, the problem of the relation of Semitic with Hamitic, not less than with Indo-European, depends upon that of Semitic growth, and the two must be solved together. There are striking correspondences between the pronouns of the two families, such as, if supported by evidences from other parts of their material, would be taken as signs of relationship; but, in the absence of such support, they are not to be relied upon, not till it can be shown to be possible that two languages could grow to be so different in all other respects as are Egyptian and Hebrew, and yet retain by inheritance corresponding pronouns. And the possession of grammatical gender by Indo-European, Semitic and Hamitic speech, and by them almost alone, among all human languages, though an extremely noteworthy fact, is (as was pointed out above) in the present condition of linguistic science quite too weak a basis for a belief in the original identity of the three families.

Egyptian is limited to the delta and valley of the Nile, and is the only Hamitic language which has ancient records; of the others the existing forms alone are known.

The Libyan or Berber division of the family occupies the inhabitable part of northern Africa, so far as it has not been displaced by intrusive tongues of other connexion—in later times the Arabic, which since the Mahommedan conquest has been the cultivated tongue of the Mediterranean coast, while the earlier Vandal, Latin and Punic have disappeared, except in the traces they may have left in Berber dialectic speech. The principal dialects are the Kabyle, the Shilha and the Tuareg or Tamashek, corresponding nearly to the ancient Numidian, Mauretanian and Gaetulian respectively.

The third or Ethiopic division includes as its chief members the Beja or Bíshárín, the Saho, the Dankali, the Somali, and the more inland Galla; the first two lying along the Red Sea north of Semitic Abyssinia, the others south of it, to the equator. By some authorities (Lepsius, Bleek) there is added to the Hamitic family as a fourth division a group from extreme southern Africa, the Hottentot and Bushman languages. The ground of this classification is the possession by the Hottentot of the distinction of grammatical gender, and even its designation by signs closely corresponding to those used in the Ethiopic division. Others deny the sufficiency of this evidence, and rank the Hottentot as a separate group of African dialects, adding to it provisionally the Bushman, until better knowledge of the latter shall show whether it is or is not a group by itself. If the Hottentot be Hamitic, we shall have to suppose it cut off at a very remote period from the rest of the family, and forced gradually southward, while all the time suffering mixture both of speech and of blood with the negro races, until the physical constitution of its speakers has become completely metamorphosed, and of its original speech no signs are left save those referred to above; and while such exceptional phonetic peculiarities have been worked out as the use of the clicks or clucking sounds: and this must be regarded as at least extremely difficult.

4. *Monosyllabic or South-eastern Asiatic Family.*—This body of languages may well enough be the next taken up; and here again (as was the case with the preceding family) on account of the prominent importance of one of its dialects and of the people speaking it—the Chinese people and language. The territory of the family includes the whole south-eastern corner of Asia: China on the north-east, farther India in the south and the high plateau of Tibet, with the neighbouring Himalayan regions, to the westward. The ultimate unity of all these languages rests chiefly upon the evidence of their form, as being all alike essentially monosyllabic and isolating, or destitute of formal structure; the material correspondences among them, of accordant words, are not sufficient to prove them related. The Chinese itself can be followed up, in contemporary records, to a period probably not far from 2000 B.C., and the language, the people, and their institutions, are then already in the main what they have ever since continued to be (see CHINA); the other leading tongues come into view much later, as they receive culture and religion from China on the one hand (the Annamites), or from India on the other (the Tibetans, Burmese, Siamese); and the territory includes great numbers of wild tribes unknown until our own times, whose race-relations and language-relations are as yet very obscure. Current opinion tends to regard the Annamites, Peguans and Cambodians (the Mon-Khmer group) as forming a more nearly related group or division, and as having been the earlier population of Farther India, in part dispossessed and driven forward by the later intrusion from the north of Siamese and Burmese, of whom the former are more nearly related to the Chinese and the latter to the Tibetans. The Mon-Khmer group is itself more nearly related to the Kolarian and Malay-Polynesian.
